RUNT PIGEONS.

HAVE you ever given an engraving, history and description of the Runt pigeon? If so or not I should like to see it. A friend of mine praises them. Can you give me any information?—PIGEON FANCIER.

IN response to our correspondent, we give an engraving of a pair of Runts. But when he asks us to give history and description our space fails us. There is a great variety of Runts; and they differ much in color. There are the Leghorn, Spanish, Freisland, Roman, Smyrna, etc.

The Leghorn Runt is described as a stately pigeon, seven inches and more in the legs, close-feathered, fast fleshed, broad chested, very short in the back, tail turned up like a duck when he walks, but turned down when he plays; neck longer than any other pigeon, carried bent like a goose or swan; head like a goose; eye lies hollow in the head, with a thin skin around it; beak very short with a small wattle on it, and the upper chop a little bending over the under. It is a very tender bird. The best are black or red—mottled.

The Spanish Runt is the longest bodied of all pigeons, thick, short-legged, loose-feathered, loose-fleshed, and do not walk erect like the Leghorn. They are of all feathers, sit heavy on their eggs and break them.

The Freisland Runt is one of the larger sort of middle-sized Runts. Its feathers stand all reverted, and is ugly in the extreme in appearance.

The Roman Runt is so big and heavy it can hardly fly.

The Smyrna Runt is middle-sized and feather-footed. Feathers often grow on the outside of each foot, causing them to look as if they carried wings on their feet. Some of these feet-feathers are said to have measured four and a-half inches long.

The Runts most shown in English exhibitions are blue and silver, with dark bars on the wings, and white rumps. They do not fly well because of their great weight. They should be kept in a room on the ground. They are fair sitters and nurses if allowed room to fly a little; but they are not prolific if closely confined. They do not reqeire especial care in rearing. Indian corn ad a stiff oat meal paste is their favorite food.

POULTRY NOTES AND QUERIES.

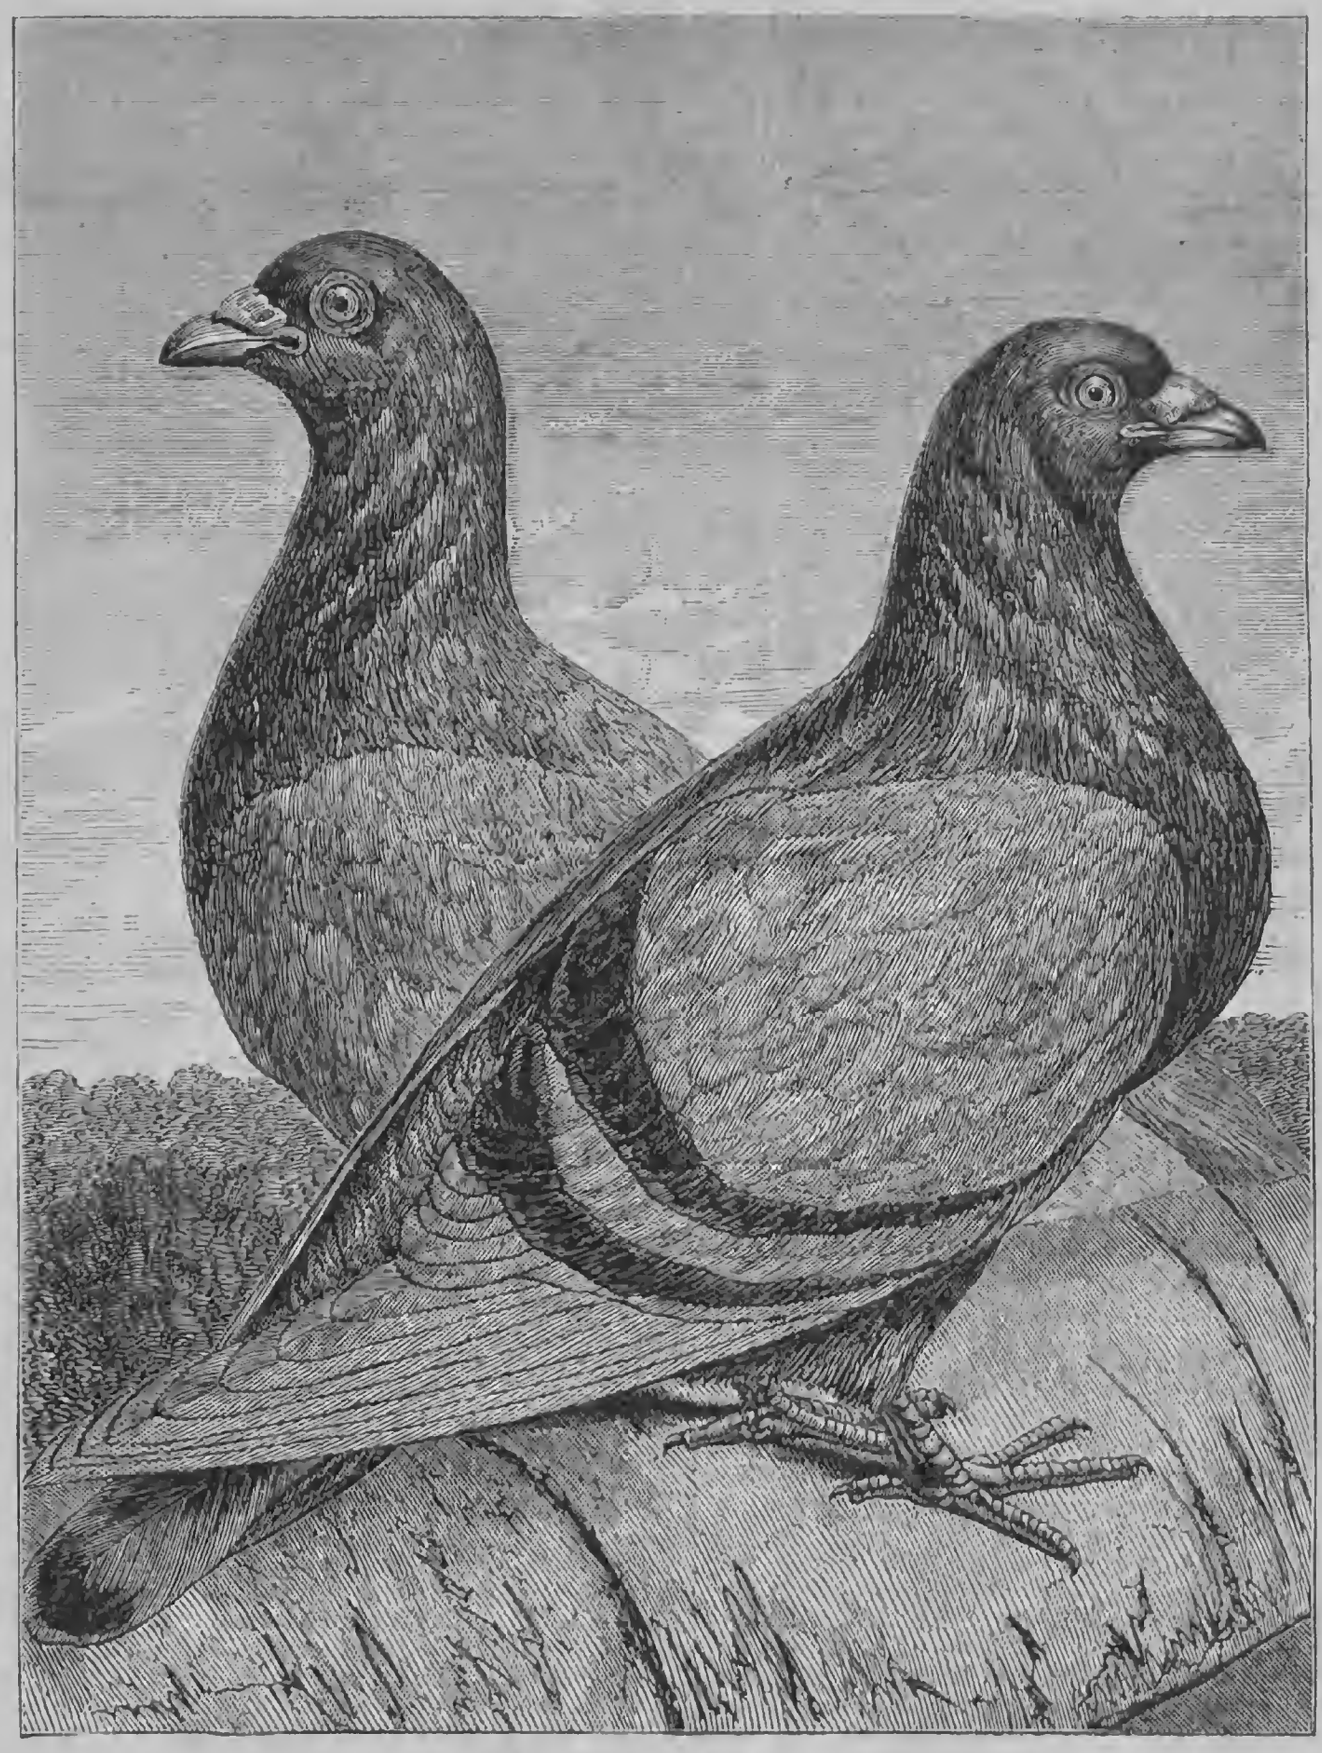
Fleshy Lump on Hen's Foot.—I am an amateur raiser of fowls. I have a case which I cannot cure. It is a lump of flesh on the bottom of the foot. When I first noticed it it was a little lump; but it grew larger till the hen died from it, as I suppose, as she had no other disease to my knowledge. Within a week a similar bunch came out on another hen. Both hens are Brahmas. If you can tell me of a cure you will oblige me very much. I have had two Black Spanish die, and another one that I expect will die; they droop about, are weak, and their feathers seem all ruffled and tumbled up.—WILLIAM H. SNOW, *Newton, Mass.*

CAN any of our correspondents help Mr. SNOW by suggesting a remedy?

Cayuga vs. Aylesbury Ducks.—I like the Cayuga; but I don't know anything about the Aylesbury ducks, from experience. I should like some of your correspondents who have had experience with both to tell me which is best and why.—A YOUNG DUCK RASER.

Fattening Poultry.—Will some RURAL reader give his or her experience in regard to fattening poultry—especially Spring chickens. I would like to know whether it pays or not to fatten them for market. —YOUNG AMERICA.

Dorkings not Feather Birds.—W. R. is informed that an English authority says: "There are three classes of Dorkings at most large shows—Gray, Silver-Gray, and White. In the former any color is allowed and is correct. Color has nothing whatever to do with an ordinary Dorking. It is a table, not a feather bird. Weight, size, shape, and early maturity are the merits sought for. The Silver-Gray is a very attractive bird, having the light breast and white shafts you admire. The White is of course self-colored. The heaviest Dorkings are generally dark-feathered birds, and their plumage does not show dirt.



RUNT PIGEONS.

Field Crops.

HUNGARIAN GRASS IN PENNSYLVANIA.

A CHESTER Co., Pa., farmer writes the Practical Farmer as follows:—"We have tested fully the merits of Hungarian grass this season, and are greatly in favor of it. Our farmers have generally harvested a crop of two or three tons to an acre, of excellent hay, which is a great thing in this season of scarcity.

"We know of no crop which stands drouth so well. The crop was made this year in sixty-five days. We do not yet find any analysis of it, but practical facts tell us that all our animals are fond of it, and they thrive while eating it, better than on any forage we give them. As we must look to selling hay in this region, if Hungarian grass does not sell, it will do finely for home stock, and farmers can then sell their timothy. We cannot live here longer by cattle feeding and grain raising, which are monopolized by western competition. This Hungarian will prove a great help; it grows soon, and wheat follows it, better than on oats stubble. Thick seeding makes fine hay, and as much of it by weight as the thin, coarse stuff. One of our farmers sowed 21 qts. per acre, but the grass was too coarse. I would not sow less than one bushel per acre."

FIELD NOTES AND QUERIES.

Broom Corn in Illinois, Varieties.—A correspondent of the Country Gentleman at Champaign, Ill., writing Aug. 28 says:—Three varieties are planted here, namely, the Early Mohawk, the Missouri and the Chinese Evergreen. The Mohawk has been mostly secured and in good order, but the stimulus of rain and heat combined has been too much for the Missouri and Chinese Evergreen, and the brush of both has badly broken down; that is, the growth has been so rapid that when the panicle or brush pushes through the enclosing and supporting spatha or sheath, it has not stiffness and strength enough to remain upright, but falls over and hangs down. This does not affect the health or growth of the plant, but it hurts very much the commercial value of the product, since it permanently crooks and twists the brush.

Amount of Clover Seed per Acre.—R. P. WYCOFF, West Va., asks what is the general yield of clover seed per acre. We reply that the range is from one to eight bushels. We have rarely known it to exceed the maximum number given.

Disposal of Castor Oil Beans.—I would like to know the best way to dispose of castor oil beans after raising them—whether to sell them or make oil from them. —Y. M.

Farm Economy.

THE ADVANTAGES OF IRRIGATION.

SOME of the advantages of irrigation are thus stated in a paper read by Dr. HOPKINS, before the Carmarthenshire Farmers' Club:

"Water alone contains in nearly all instances an amount of fertilizing salts so diluted that it is at once absorbed and assimilated by the pastures. Water is always impregnated with atmospheric air and a minute quantity of carbonic acid. Deprived of air it is not agreeable to drink; it is even known when long continued to prove unwholesome. If the dissolved gases are expelled by ebullition, river and brook water usually contain one-thirtieth in volume of air, and one-fiftieth carbonic acid. In spring water the amount of the latter is sometimes far more considerable. The quantity and nature of saline ingredients in drinkable water vary much; in an agricultural point of view, the study of the contained salts would certainly be useful. The waters which serve as drink to the cattle of a farm introduce to the dung-heap all the matters which are dissolved or held in suspension. It has been found that on an ordinary-sized farm, more than 2 cwt. of alkaline salts get into the dung-heap in this way every year. You will thus perceive that irrigation by plain water must be of enormous service, applied to the surface of light and dry pastures.

"Salt you will find an excellent *addition* to irrigated fields. Salt is not a thing which shows itself conspicuously in the production of great luxuriance, but rather in giving strength to the stem of the wheat, and I may say an admirable condiment and healthful improver of grass lands. This substance can be sown broadcast in any weather; about 4 cwt. is a good dressing for an acre of grass land; if mixed with 2 cwt. of guano for grass or wheat, so much the better, or mixed for a time with the furrows taken out will be still better, to which may be added, the cleansing of the ditches.

"All this, I admit, involves labor, and labor is now very dear, but the result will show it is worth all the money and something more. Those who have made vegetable physiology their study know that in agriculture and other forms of vegetable propagation it is difficult to get too much water upon pervious soils, and does not remain stagnant for a longer time than is required to separate most of its fertile properties. I may add that the manures deposited upon the surface by cattle, sheep, and horses during the heavy rains so constantly recurring in this country, and carried into the brooks, then to the rivers, and thence to the sea, become altogether lost to the cultivator, but, by proper adaptation and care artificial irrigation will secure to him his legitimate share of that advantage which should exclusively belong to his taking.

"In conclusion, I may state that it is undoubtedly one of the most important duties entrusted to man that he should learn to control the elements and by bringing science and art to bear upon the works of Nature to render them subservient to his will in promoting the general welfare of the human race, and to contribute to its every-day requirements. Thus we see that destructive elements like fire are fairly brought into subjection and forced to contribute to our wants in a thousand different ways. The earth yields its hidden treasures for a similar purpose, and every description of soil which covers the surface has its allotted task to perform; whilst air and water, in addition to being absolute necessities of existence, have yielded the force and power with which they are invested to be applied in an infinite variety of ways to the wants of mankind."

STEAM PLOWING IN ENGLAND.

THE necessities of the British food-consuming population is attracting increased attention among the British economists. Whatever affects British food production affects, in a greater or less degree, American producers; and it is well, therefore, to keep watch of what is done and said in the thickly populated countries dependent, in some degree, upon American products for food. For instance, Lord DUNMORE has been giving attention to this matter of food production in England; and he estimates that deep cultivation by steam, the uprooting of hedge-rows which foster rabbits and destructive birds, and the transforming of table-cloth plots into forty-acre fields, would assure an addition of from £28,000,000 to £37,000,000 worth of food per annum to the British food-consuming community; that the British pay foreigners, annually, for food, £17,714,000, and that if what is now comparatively non-productive were made productive land, only from one-sixth to one-third of this sum would go into the hands of foreign producers.

A Scottish Agricultural paper asserts that Lord DUNMORE does not certainly overestimate the advantages of steam plowing, and says:

A six-furrow plow can turn over about as much in a day as two dozen horses, and at two-thirds of the cost. Then the shares can be made to penetrate the ground to a much greater depth than plowing can be accomplished by horses. Then, again, steam being so much speedier than horses, can be taken advantage of over a greater breadth of land in the autumn than horses can be. It does its work at the proper time in September, when the land is dry and the sun hot enough to kill the weeds which have been uprooted by the cultivator. The steam plow makes level the surface of the land. Ridges and furrows disappear before its operation, and so the path is made straight and easy for the reaping machine, thus effecting a great saving in the cutting of crops. Another matter of importance in connection with the application of steam to the cultivation of the soil which Lord Dunmore appears to have overlooked, is the fact that the treading of the horses' feet is done away with. No sodden hoof-prints are left upon the ground to the detriment of the seeds therein deposited. In fact, in every particular, steam surpasses horse-power in the way of culture, and the cost of the better work it does is much smaller.

Now, one word about the kind of steam culture he recommends. Lord DUNMORE was once enthusiastically in favor of steam traction engines as means of propelling plows. He has changed his mind. He gives, now, the preference to FOWLER'S double engine method. Its only objection is its great expense; and he recommends the formation of companies who shall own such machinery, and hire them out to farmers. This is the only practical way in which steam plowing can be rendered practicable in this country. Steam plows cannot be owned and run profitably by small farmers. There must be companies formed to own and run them. These companies may be organized among farmers themselves. The advantages will be a gain in time, better and deeper plowing, a saving in the expense of owning and feeding teams, and a more systematic and thorough treatment of lands. This will come in time; but if the necessities of British farmers have not resulted in the employment of steam plows in husbandry, and if such arguments are necessary there, we need not hope that American farmers will speedily adopt, except on large farms, what our British brethren are so slow to embrace in their agriculture.

ECONOMICAL NOTES.

A Very Good Compost.—A very good fertilizing compost is manufactured by using the following substances according to the directions given. The mixture has been called "Liebig's great fertilizer," as it is stated that it originated with him. This is doubtful, but it is a very judicious and sensible combination nevertheless, easy to prepare and cheap. It will prove serviceable for corn, wheat, and the other cereal grains, and also for grapes:

This amount will do well, applied to one or two acres, and it will cost not far from $10:

1. Dry peat, twenty bushels.
2. Unleached ashes, three bushels.
3. Fine bone dust, three bushels.
4. Calcined plaster, three bushels.
5. Nitrate of soda, forty pounds.
6. Sulphate of ammonia, thirty-three pounds.
7. Sulphate of soda, forty pounds.

Mix numbers one, two and three together; then mix numbers five, six seven in five buckets of water. When dissolved, add the liquid to the first, second and third article.—*Journal of Chemistry.*

Cheap Mode of Irrigation Wanted.—I would like to know the different modes or ways to irrigate land. I have never seen or heard described a good, cheap way of irrigation, or in fact any way; and as I anticipate going where irrigation will be practicable at some times of the year, I should like to learn through your valuable paper the best way to do it. Will not some of your experienced readers respond?—F. W. MANSON, *Greene Co., N. Y.*

Sugar from Sugar Beets.—A correspondent asks if sugar or sirup can be made from sugar beets with such utensils as are usually found in the farmer's kitchen? We reply, No.

Industrial Machinery.

WILSON SEWING MACHINE PALACE.

LAST year we gave the readers of the RURAL NEW-YORKER a view of the extensive factory in which the Wilson Sewing Machine is made, at Cleveland, Ohio, along with a history of the invention and progress of the machine itself, in the hands of its enterprising proprietor, W. G. WILSON, and his chosen associates. Since that notice, the advance in the business has compelled Mr. WILSON and his associates to look for more ample quarters even than their late elegant rooms on Seneca street, and, accordingly, arrangements were entered into for the construction of a large building on Superior street, to be used as sales and show rooms, and for the business apartments of the officers of the Company; and also a large building in the rear of this, fronting on Rockwell street, as a principal warehouse for the storage and shipment of machines. This warehouse occupies a space of sixty-two by one hundred feet; three stories and a basement, entirely occupied as a storage and shipping house. The principal salesroom, in which are the Company's offices, has a south frontage of forty-two feet on Superior street, with a depth of one hundred feet along Bond street.

It is the interior of this magnificent room to which we now introduce the readers of the RURAL NEW-YORKER, as well as the sketch (see page 209) can do it, but which can convey only a faint idea of the brilliancy and richness of its adornments and furnishings. The visitor enters the front of the main room from Superior St. through doors which hang between immense pairs of plate glass, sixteen feet in hight, admitting a flood of light across the superb apartment. Once through the door the visitor finds himself in the midst of almost regal magnificence, having more the air of a royal drawing room than of a place for business. Rich and elegant carpets cover the floors; elaborately wrought cases contain the smaller articles belonging to the retail branch of the business, with desks for the attendants, to correspond. Along the left side of this room is a magnificently carved counter and screen, dividing the places of the Secretary and his clerks from the large salesroom. This counter is cut from solid walnut, exhibiting exquisite wreaths of flowers, panels of plate glass, and with its rich polish is a rare work of art in its line. Back of this counter and screen are the desks of the Secretary, Cashier, and Clerks, all of the same luxurious style. In the main room are fourteen elegant chandeliers of gilt bronze, each bearing twelve burners, cased in glass globes, on which are engraved the monogram of the Company. The painting of the walls and ceiling of this room is a finished work of art. The principal figure at the north end of the room is a full length portrait of W. G. WILSON, President of the Company, sitting like a gentleman at his ease—a position which Mr. WILSON'S active and industrious habits allows him small time to occupy. In various panels about the walls and ceiling are pictorial devices and portraits, suggested by the business to which the place is devoted. Along the cornice, in separate panels, appear the portraits of the officers and prominent employees of the Company, done to the life, both as to the gentlemen and ladies who daily occupy these magnificent apartments.

The President's private office is reached through a door in the north end of the main room. This office is a marvel of elegance and comfort, with its rich carpet, carved furniture, splendid chandelier and handsome paintings, making it more like the boudoir of a prince than the brain-engine room of the presiding genius of a business which reaches its arms into all lands, from Ohio to Japan.

As the city of Cleveland has long been noted for the elegance of its private dwellings, so it has now a business house as nearly like a palace as the cunning work of the craftsman can make it—all the result of a well managed business in the hands of the Wilson Sewing Machine Company.

Rice Huller Wanted.—TheMobile Register says: "Strange that some genious does not give us a rice huller so cheap and so simple that every farmer might own and work one. It certainly could be made, and nothing would find a more ready sale, for every ruralist in the lower South could grow his own rice, and would do so if he had any easy means of preparing it for food. We want a little iron machine to run by hand, and cost as much as a good coffee mill or a sausage grinder; and so simple that the housewife will be able to hull out and prepare her rice for the pot at any time desirable. Are we to have such a machine? There is a fortune awaiting the lucky man who gets it up."

Cotton Picker.—W. H. IRVING, Philadelphia, Pa., is reported to have invented a cotton picking machine which is said to have been successfully tried in the field. It is claimed by the inventor that it will pick twelve acres per day with the help of two men, a boy and a pair of mules, and put the cotton in bags ready for the gin-house. This is a "big thing" if it will do all that is claimed. We have been surprised that something of the sort has not been invented before.

The Garden.

WINTERING VEGETABLES.

IT is one thing to raise a good crop of vegetables, but quite another to keep them safely through Winter. It is, doubtless, the fact that more vegetables are injured by heat in Winter than by cold, because most persons crowd such things together in large quantities, and then cover deeply to keep out the frost. When placed in cellars, the windows are closed, and in the more Northern States, banked up with, perhaps, fresh horse manure from the stable. Of course it is necessary to keep potatoes, turnips, beets, and similar roots from freezing; still they would be of far better quality if kept as cold as possible, and not actually frozen. Turnips and beets, in particular, are very liable to heat, and become spoiled if a large quantity is placed together; and potatoes are often injured by being stored in large bins, instead of being put in barrels or spread thinly upon shelves in a dark cellar. When buried in the ground, small heaps, say twenty to thirty bushels in each, is best.

Celery.—Celery that is not sufficiently blanched when cool nights come on, and there is danger of frosts, should be banked up to the topmost point of the leaves; then cover with straw or boards. When the ground begins to freeze, dig up, and place all in a narrow trench, in some dry and convenient place, where it can be protected from frost and still be got at when wanted for use. Pure sand is better than soil to pack in among the roots and stems for Winter preservation.

Parsnips and Salsify.—As these roots are benefited by freezing, or are at least not injured by it, they may be dug up and placed in a trench and only slightly protected; just sufficient to admit of taking out what are wanted for use during Winter. If they are only wanted for use in the Spring, then they may be allowed to remain where grown.

Onions will withstand far more cold than is usually supposed. If packed dry in tight barrels, and all interstices filled with chaff, they may be kept in a barn, or where they will freeze quite hard, and not be injured, provided the barrels are closed tight and not opened until the onions are again thawed. Onions stored in a warm cellar are very likely to sprout in Winter, and then decay, emitting anything but an agreeable odor.

The too general custom in the country, of putting all kinds of vegetables in the cellar under the dwelling house is not conducive to the health of the inmates at least; besides, it is scarcely possible to keep all kinds equally well preserved in the same temperature. It is a far better plan to store the different kinds separate, or at least place them where ventilation can be given when necessary. Potatoes and carrots are about the only roots that can be preserved in a cellar which is not well ventilated in Winter; and then no very large quantity can be safely placed together.

Cabbages.—This is one of the quickest decaying vegetables, if kept in a warm place; and the usual practice in this vicinity is to set the heads in a furrow, with the roots up, and then cover very lightly with earth. In such a position they remain frozen nearly all Winter, and come out in Spring almost as fresh as when gathered in Autumn. We cannot say how this plan would answer farther North or South; but it answers every purpose here, and New York City market is supplied in Winter and Spring from the open fields.

We believe that as a rule farmers fail in preserving their vegetables, simply because they try to keep too many kinds together, and all in far too warm a temperature.

Dairy Husbandry.

INFLUENCE OF ELECTRICITY ON MILK.

In an address before the Ohio Dairymens' Association, during the early part of the present year, we gave an account of some interesting experiments with electricity made by the late ANDREW CROSS, the celebrated English Electrician. The Boston Cultivator, quoting from some newspaper report of said speech, (wrongly placing its delivery before the Northwestern Dairymens' Ass'n), gives the substance of our remarks, commenting upon them as follows:

"'The (this) influence of electrical action is a subject *entirely* new to the dairy public,' says Prof. WILLARD. We doubt this, for as long as we can remember, it used to be a common saying among dairy women on the farm that 'thunder showers sour milk.' The query was then raised,—Why does lightning sour milk? We have since learned or heard the following reason given: Lightning causes the gases of the air through which it passes (the air being composed of two gases, oxygen and nitrogen, *mixed*, but not combined; oxygen, combined with nitrogen, producing five deadly poisons, viz., nitrous oxide, nitric oxide, hyponitrous acid, nitrous acid and nitric acid, according to the proportion of each gas in the combination) to *combine* and thus produce a poison called *nitric* acid; some small portion of which mixing with the milk turns it sour. Lightning also tends to sour new beer, the process of fermentation being incomplete, lightning so accelerates it as to turn the sugar into acetic acid at once; in old beer or ale, where the fermentation is more complete, it is less affected by the electrical influence.

"Of positive and negative electricity—called also vitreous and resinous—the lightning passes from the earth to the cloud when positive, and from the cloud to the earth, when the cloud is in the positive state—the flash, as it is said, always proceeding from the positive body—*i. e.*, from the one overcharged.

"We think Prof. WILLARD errs in what he says of the negative electricity or state of the atmosphere; for it has been said that the clouds are charged with positive electricity, barns and houses struck are set on fire, but not so when the clouds are negative and the earth positive. Hence we deem the souring of milk is caused as we state the case above."

Now, CROSS demonstrated that milk could be kept sweet for three weeks, in the hottest weather in summer, by the application of electricity. In all his experiments, going over a long series of years, he found that positive electricity was favorable to all vegetable growth except fungi, to which it was prejudicial, while negative electricity promoted the growth and development of fungi in a most remarkable manner. This influence of electrical action in preserving milk sweet for an unusual length of time, as well as its influence on the growth of fungi, as detailed in the experiments of Cross, we thought was entirely new to the dairy public. We did not mean to have it inferred that a fact so commonly observed by all dairymen in respect to milk souring during thunder storms, or on account of thunder storms, was new. The observation of this fact is old; but the reason has never been satisfactorily explained—at least not satisfactorily to us and others who have made milk and the dairy a study. The result of Mr. CROSS' experiments appeared to us to give a philosophical explanation to this matter, and to harmonize with the recent theory of the cause of milk souring.

If, as it has been shown by PASTEUR, HALLIER, ALEXANDER MUELLER and, more recently, by Prof. CALDWELL, the souring of milk is the result of living organisms, that the dust of the atmosphere as well as all fermenting or putrifying matter contains either the germs of the microscopic fungi or the fungi themselves in one stage of development or another; that these germs fall on all substances exposed to the air and that if the substance so exposed is one that can nourish their further development, they will vegetate and increase, and in so doing cause the substance itself to decompose. If, we say, this theory of distinguished scientists be accepted, and if the practical experiments of CROSS proved that negative electricity promoted the growth and multiplication of these fungi in a most remarkable manner, then we say there is a philosophic reason why milk sours during thunder showers.

The theory named by friend WETHERELL of the Cultivator is that which was promulgated years ago, and does not harmonize with the more recent doctrine accounting for the changes which occur in milk. We are aware there are many things concerning electricity which are imperfectly understood. Dr. LITTLE, in some remarks on electrical fluctuations, published in the North American Chirurgical Review, says:

"The electrical fluid is the grand agent in the production of many of the phenomena of nature. In her organic domain it is the probable cause of all chemical change, while in the vegetable kingdom it performs still more important functions; not only producing, in conjunction with its kindred agencies of light and heat, conditions favorable to the germination and growth of plants, but quickening them into life and thus becoming the efficient cause of their development. The approach of an electrical conductor to the *mimosa pudica*, or sensitive plant, produces no sensible effect; but if sparks be taken from it the leaflets will shrink and close as they do from mechanical contact. Its more steady and quiet operation is equally remarkable. An electrical circle has been formed under the beds of a garden, and the result has been greater vigor and rapidity of growth in the plants which they contained; a fluid so analogous to the nervous force, so subtle, fluctuating and so universally diffused, might, *a priori*, be supposed to exert a very manifest influence over the higher organization of the animal economy. In other words, as a vital electrical machine, by means of which that fluid is both separated and distributed in accordance with the wants of animal life. What we should thus suppose, is found to be true in fact. Electricity, present in excess, exciting the functions and excitality, while a *contrary effect is produced by its subtraction or deficiency.*"

We have all experienced the feeling of energy and elasticity which is imparted by what we call bracing weather, when the air is clear, dry and cold; and more strongly still the sensation of chilliness and discomfort when the atmosphere, loaded with moisture, has acquired an active conducting power.

During the early part of the year, in detailing the experiments of Cross in regard to the effects of electricity on milk, to a distinguished Professor of Chemistry, he thought them of great interest, and proposed making some practical experiments in this direction. We hope, therefore, at some future day to give friend WETHERELL and the public something more on this question, which shall settle the point, by a full explanation, of how and why electricity affects milk.

The Vineyard.

VINEYARD NOTES.

Grapes in Bottles of Water.—The best kind of bottles for preserving grapes in water are those made of clear glass, of a size that would contain about a pint. In clear glass bottles, when the water, by means of evaporation and the small quantity sucked up by the bunches, has decreased, the deficiency can be easily seen and remedied. Champagne bottles would do for preserving a few dozen bunches, but they would be too large and clumsy to put in the racks where a large quantity of grapes are preserved. Pint porter or ale bottles do very well; I used them before I got clear glass bottles made for the purpose. The water in the bottles wants no changing, as it will remain sweet for three or four months, or longer if some small pieces of charcoal are put in the bottom of the bottles. It only requires filling up now and then when it gets lower than the neck of the bottles.—WILLIAM TILLERY.

Wine Two and a-Half Centuries Old.—Two and a-half centuries ago there was deposited in a cellar at Bremen a case of wine containing five oxhoft of 204 bottles, cost 500 rix dollars in 1624. Including the expense of keeping up the cellar, contributions, interest on amounts, and interest on the interest, an oxhoft costs at the present time, 555, 057, 640 rix dollars; a bottle is worth 2,723,812 rix dollars; a glass, or ⅓th part of bottle is worth 340,476 rix dollars or $272,389; or at the rate of 540 rix dollars, or $273 per drop.

Ducks in a Vineyard.—It is mentioned in The Grape Culturist that a large vineyardist in Illinois keeps each season not less than one hundred ducks constantly among his vines. He says it is wonderful with what diligence they dart after all kinds of bugs, thrips, flies and small snails, and he considers them among the best of insect exterminators.

Land Department.

SOMETHING OF TENNESSEE.

WHAT is known as the Cumberland Table Land, or Plateau, is a strip of elevated country which, branching out from the Blue Ridge and mountains of Virginia, proceeds in a southwesterly direction, and terminates in the rough pine lands of Georgia. In and about these mountains are numerous small valleys, some of which, being situated in the midst of the mountains, are completely surrounded, and the streams which take their rise in them, and which, in many instances, are so large as to afford a good water-power, have no outlet except through the caves which everywhere perforate this limestone region. Across this Plateau, and through these mountain valleys, is a pleasant horseback ride in the Spring, when the buds are beginning to swell, and the warm, pleasant weather has more the appearance of Summer than of Spring.

Setting out from Sulphur Springs, a small village lying near the eastern slope of the mountains, the writer ascended the mountains by a rocky, zigzag road, and proceeded along what is called the old stock road, over which droves of mules pass from Kentucky to a Southern market. A short distance from the top the road leads over a high knoll or mountainous crag, which looms up considerably above its neighbors, and affords a good view of the valley of the Tennessee River and the long stretches of forests which extend in every direction across the level Plateau. A little further on the road passes along the edge of an exceedingly deep chasm, formed by the washing of a rapid mountain stream. At this place it becomes almost a river, and takes two leaps of 150 feet each. Just below the lower fall, the banks on each side of this huge gulf are nearly perpendicular, and one can look down a thousand feet, and still the eye rests upon the tops of tall trees. The place has quite a notoriety as a resort for summer excursionists, and it rejoices in the very suggestive, though rather questionable, appellation of Hell Hole.

The country is sparsely populated, and houses are far between; now and then a well-trod path crosses the road at right angles and makes out into the woods. Occasionally a fence appears, inclosing a log house and a few acres of cleared land, where some poor squatter and his family practice each year what they know of farming, which practice consists in planting the same crop, on the same ground, as long as the stubborn soil will yield a sufficiency of the material for corn dodgers, when they all pull up stakes and move away, to repeat the process somewhere else. The road next leads down into a deep ravine, through which passes a roaring mountain stream, bordered with Laurel, and overgrown with Ivy and Weeping Willow. Several years ago, a Northern man settled here, and built a saw and grist mill. When the war came, a band of guerrillas surrounded his house and demanded him to surrender. This he refused to do, but stood in the door and fought them, while his wife did good execution with a revolver from the window above. The guerrillas were at last put to flight, leaving the determined couple in possession of their home.

At length our road leaves the mountain and begins to descend into a beautiful little valley called Grassy Cove. The land on the sides of mountains which surround this cove are exceedingly rich, as is shown by the large growth of Oak, Poplar and Black Walnut along the roadside. Grassy Cove is well named, and the large meadows of clover and timothy are in pleasing contrast with the rather sterile country over which we have passed. Several Northern families are settled here, and are making improvements and building up a community of their own. A mill has lately been erected and is busy sawing lumber for those who have lately arrived. It being near the middle of the day when I reached Grassy Cove I stopped at Mr. STRATTON'S, a gentleman who bought a large farm here and moved from New York three years ago. Mr. STRATTON brought with him a herd of eighteen Devon cattle; the cattle looked remarkably well, and Mr. S. informed me that he gets as much milk and makes as good butter and cheese as he ever did in New York; and if I am any judge of these articles, the specimens on his table corroborated the statement. I was shown a meadow on this place which is said to have been in grass thirty-six years, and still yields from two and one-half to three tons of hay per acre. Fruit of all kinds peculiar to this climate grows abundantly, and I saw some astonishingly large apple trees which I was told had only failed once in thirty years. Mr. STRATTON and the other people here are anxious to have Northern people come in, and will cheerfully answer all inquiries of persons wishing further information about the country.

Leaving Grassy Cove I continued my journey to Crossville, a small village on the Table Land, situated at the junction of four or five roads. The village consists of quite a number of new houses, mostly unpainted; it boasts of three stores, and has another establishment which it does not boast of, called, in Tennessee parlance, a "grocery," but which, in other places, would go by the name of *saloon*. The proprietor of this establishment does a very thriving business, considering that his stock in trade consists only of a keg of apple brandy and a tin cup.

A. H. L.

Crossville, Tenn.

SOUTH-WESTERN KENTUCKY.

PROBABLY a line or so from this section of country would be acceptable to some of your numerous readers. Southern Kentucky is distinguished for the fertility of its soil, healthfulness of climate and hospitality of its people. The soil cannot be surpassed anywhere. It is peculiarly adapted to the cultivation of almost anything that is produced in the United States, except cotton and rice. Tobacco is cultivated in large quantities, and is the great staple of this particular section. Corn, wheat, rye and all the grasses grow finely. This is rapidly growing to be a fine stock country. For many years past the farmers have not paid the attention to stock that they should have done, that department being neglected to a great extent on account of the vast amount of labor and attention requisite in the cultivation of tobacco. The introduction of fine stock, of every description, is now beginning to excite public attention. The best breeds are anxiously sought after, and we hope ere long to be able to announce a great improvement in that department.

Our lands here command from ten to fifty dollars per acre, according to quality and locality. Railroads are in process of construction throughout this entire section, which, when completed, will open up a large territory yet unimproved. These roads will bring in immigrants, and furnish an outlet to market for the vast amount of produce this country is capable of yielding. The Elizabethtown and Paducah Railroad passes through one of the finest agricultural sections in the world; also through the coal region of Southern Kentucky. It will add greatly to the development of the resources of the country. We have a good people here—industrious, intelligent, generous, hospitable people, and we want more of such a population. Parties emigrating to the far West would do well to give us a call in passing.

We think our country will suit them, whatever business they may wish to engage in. We need bold, enterprising capitalists to come here and aid us in developing our vast resources. We need the introduction of more fine stock; and also that of improved agricultural machinery of all kinds. We want some of your good farmers, gardeners, dairymen, fruit-growers, and miners of the North to come out here, and bring with them enterprise, energy, and capital, and we will insure success. We need the circulation of more such papers as the RURAL NEW-YORKER, and sincerely hope the time may speedily come when all papers of such intrinsic value may have a wide circulation throughout our section.

Princeton, Ky, ONWARD.

COST OF A HOMESTEAD.

As frequent inquiries are made of the price of securing a home on the public lands under the homestead act, we give the following figures:

	Fees when entry is made.	Fees on issue of certificate.
For a grant of 160 acres, valued at $1.25 per acre.....	$11 00	$1 00
For a grant of 80 acres, valued at $1.25 per acre.....	7 00	2 00
For a grant of 40 acres, valued at $1.25 per acre.....	6 00	1 00
For a grant of 80 acres, valued at $2.50 per acre.....	14 00	4 00
For a grant of 40 acres, valued at $2.50 per acre.....	8 00	2 00

To sum up, 160 acres costs $18; 80 acres, $9; 40 acres, $7. The $2.50 land is that included within limits of railway grants, and only open to soldiers under the homestead act. A soldier must settle on his claim until the time of settlement added to his term of service in the army makes up five years, which is the length of settlement required from settlers who have not served in the army or navy.

Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

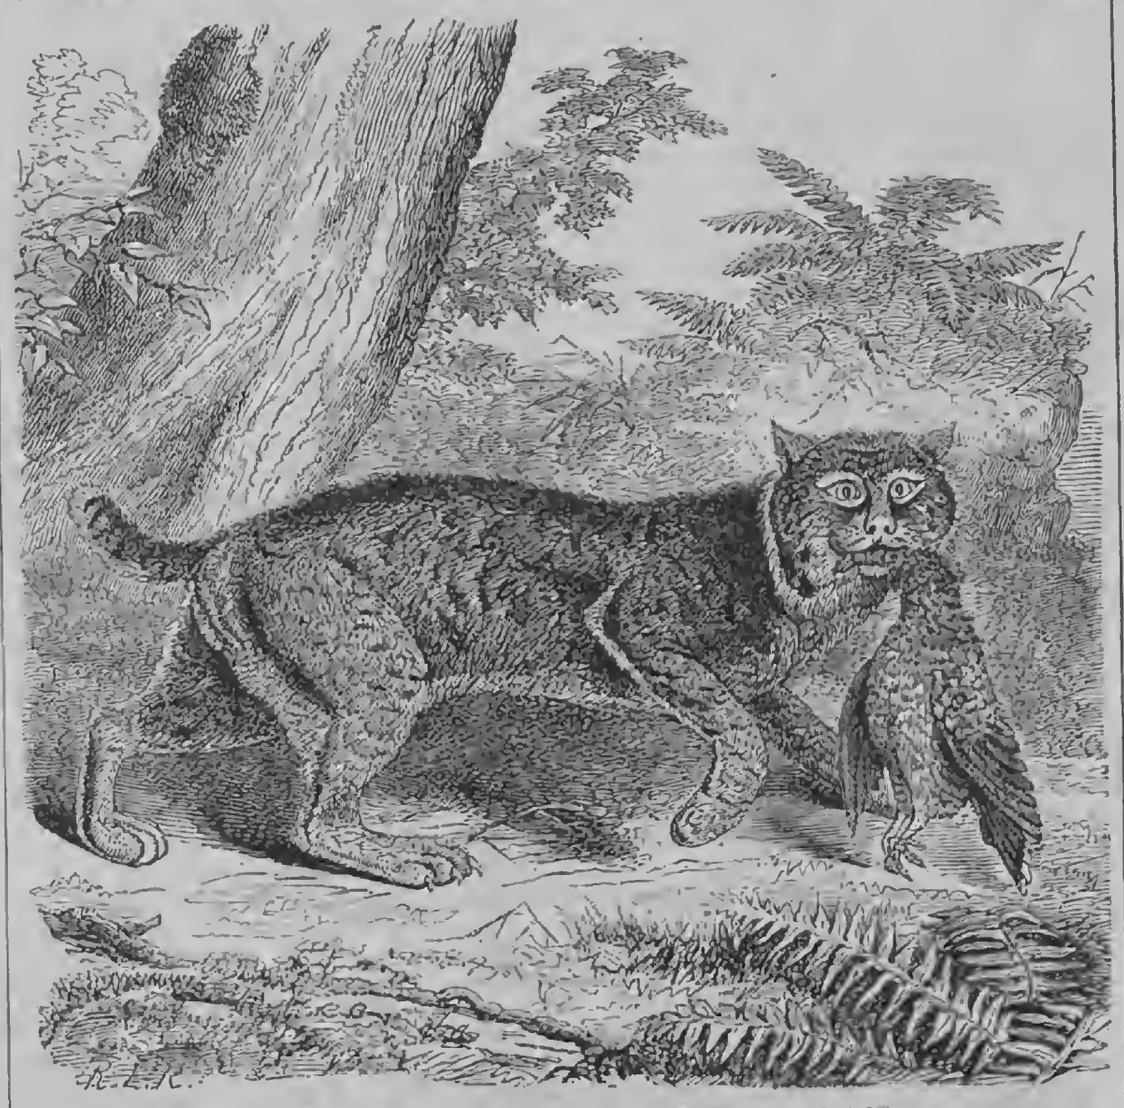
Gathering Forest Seeds.—*Sept.* 10.—It has become a habit with me to gather a few forest tree seeds every autumn—not that I plant any of them myself of late years, although I used to do considerable in that line; but I cannot get over the idea that they are worth saving. Sometimes a friend out on the prairies sends me a few insects or other curiosities for my cabinet, then I return the compliment by sending him a package of seeds, and in this way a few pounds are used, as I hope, to the benefit of somebody. The Ash, Maples, Basswoods, Oaks, Tulip Trees, Hickories and Chestnut Trees are loaded with seeds, and it is a pity that all should go to waste when they are so much needed. Last season I saved a bushel or more of hickory nuts, expecting to have sent them to a friend in Colorado, but for some reason he did not feel inclined to have them forwarded, and in Spring they were thrown out into a heap near my shop and covered with soil; but this treatment did not destroy their vitality, and they came up in a mass, continued to grow all Summer, and are now healthy, although small. The nuts were picked up after cold weather commenced, and put into a box with sand and left out where they froze during the Winter. I have treated nearly all kinds of hardy forest tree seeds in the same manner with equal success. Now is the time to secure a supply of forest tree seeds, and those who live on the prairies should not neglect the opportunity, either by sending their orders to some dealer or to friends who will gather the quantity and kinds desired.

A Destructive Insect.—*Sept.* 11.—Last Spring I purchased some hickory cord-wood that had been cut during the Winter. It was hauled out and ranked up in an open field, where I supposed it would be less liable to the attacks of the hickory borer (*Clytus pictus*, DRURY,) than if left in the woods. JOHN has commenced hauling it home to-day; at least what there is left; for this destructive insect has bored it in all directions, and its sawdust-like excrement could be scraped up by bushels from under the pile of wood. I mentioned this insect April 18th (see RURAL NEW-YORKER May 4, page 297,) as being destructive to hickory timber, cut down in Winter, but had no idea that it could or would do so much damage to hickory cord-wood in one Summer. This beetle is almost identical with the locust borer (*Clytus robiniæ*), and has often puzzled entomologists to separate them. They are, however, quite distinct in habits, as the hickory *Clytus* appears in the Spring, while the locust species invariably appears in Autumn. The size and markings of the two insects are almost exactly the same to a casual observer; but a close inspection will show that there are several distinctive characteristics, the most prominent one is the size of the antennæ, those of the hickory *Clytus* being much the more robust. I suppose those who believe in DARWIN'S evolution theory will claim that they both originally came from the same stock. But be this as it may, they are very destructive insects, and their numbers increase in proportion as man furnishes them opportunities for propagation by planting the locust tree and cutting down the hickory for firewood.

The Wonders of Ignorance.—*Sept.* 12.—The wonderful things that some persons find are truly astonishing—to themselves. If a man who is a novice in horticultural matters happens to find in his garden a fruit unknown to himself and immediate neighbors, he takes it for granted that it must be new to the rest of mankind. Of late years it has been the habit of such discoverers to show the said fruit to the village Doctor and Minister; and they being as ignorant of such things as it is safe to be, are ready to assert all that can be said in its praise, affixing the usual superlative endorsement of, "this is the best variety we have ever seen." It is not strange, considering how little the masses know of what exists outside of the little circle in which they swing daily, that a man should feel somewhat elated at his rare good fortune in procuring something deserving the commendation of the notables I have named. A few years since, a man of considerable eminence as a civil engineer, rushed into my office one morning, and laid a package upon my table, saying, as he did so:

"There! look at those grapes! I think you will be willing to give up your fancy kinds, such as Delaware and Iona, when you can get such as these."

I opened the package, and found it contained a pound or two of the vilest wild Fox Grapes that one could find in a day's journey through our swamps. But my visitor had been cultivating this grape for several years, and really did think it was a superb and valuable sort. A similar incident occurred to-day. A stranger, and, apparently, a wealthy gentleman, who had lately



COMMON AMERICAN WILD CAT.

taken up his residence in the country, came into my office, his countenance all beaming with smiles, and after inquiring if I was Daily Rural Life, proceeded to take from his pocket a very large apple, and holding it up before me, as much as to say, "look at that and be astonished," said:

"There, my man, is something worth your attention, and perhaps a description and illustration in your Diary for the RURAL NEW-YORKER."

"Why, my dear fellow," I replied, "that is nothing new, but simply the old and well-known Twenty-Ounce Pippin—a scarcely third-rate apple, only fit for cooking."

The smiles all departed at once, the bubble burst, and my would be originator or discoverer took up his hat, saying very meekly, "I thought it might be a new variety and that you would like to see it. Good day, sir."

"Good day."

This reminds me of another discoverer in quite a different field. While attending a Fair in Iowa a few years since, a farmer to whom I had been introduced led me aside, and, after looking about to be sure no one was listening, said:

"Mr. D., you seem to have been around the world some and seen most everything; now I have got a great curiosity at my house which I would like to have you see. I think it is of great value, and if you will go home with me to-night you can see it, and I'll bring you back in the morning." I agreed to this, because great curiosities were just the things I wanted to see. A ride of four miles over a rough country road brought me to the home of my new-found friend; and after tea I signified that I was ready to see *the* curiosty, and Mr. J. brought out, from some hidden recess, a small lump of something and held it out to me, saying, as he did so—"There did you ever see the like of that before?"

I saw at a glance what it was, simply a broken Geode, the inside studded with quartz crystals. Of course I had to tell my host that it was valueless; and more, that he could find them in any quantity all over the Western States. He was not as rich after my visit as before, for that diamond bubble had burst, and I am not sure that he has ever forgiven me for the information I gave him. There are scores of men in all parts of the country who are constantly finding rich beds of gold, silver and other precious metals—at least they are in imagination. What a saving of time and bitter disappointments it would be to such people if they could be induced to spend a few dollars for books treating of such things.

Iron pyrites, or as it is appropriately named, "Fool's Gold," has set many a poor fellow crazy, believing that a veritable gold mine had been found. Quartz crystals are constantly setting ignoramuses wild on the diamond question, and scores of men have spent their last hundred dollars, or all they could borrow, to bring what they supposed to be diamonds to New York, all of which proved to be worthless quartz. One poor fellow from "out West" not long since walked into a Broadway establishment and asked in the most dignified manner to see one of the proprietors. The gentlemanly clerk asked if his business was important.

"Very; and cannot be transacted with any clerk," was the curt reply.

He was shown into the private office of the proprietor, who abade him be seated and make known his business.

"Well," said our Western man, "are you Mr. B.?"

"Yes; and what can I do for you?"

"Well, sir, I have in my pocket a specimen of incalculable value."

"I cannot see how that interests me," replied Mr. B. At this our Western fortune-seeker, whom we will call JONES, pulled from his inside vest pocket, a quartz crystal about the size of a hen's egg and, presenting it to Mr. B., said, "There, sir! how much do you think that is worth?"

"About four dollars a cord, where it is wanted for macadamizing roads."

"What!" said JONES, do you pretend to say that it is not a diamond?"

"Yes, sir," said B.; it is a very poor specimen of quartz, and if you have no further business with me, please cut your visit short."

Poor JONES drew his hat as far down over his eyes as possible (it was on the back of his head when he went in), went straight out of the door and down Broadway, and I do not think he has been to New York since.

The Herdsman.

Remedy for Hoven in Cattle.—The Practical Farmer says:—We once saved the life of a Short-Horn bull, which cost us near $600, in three minutes, by twisting a wisp of hay into a band, placing it in his mouth, and tieing it up tightly behind the horns. The working of the jaws, to get rid of this encumbrance, liberates the gas in the stomach, and relief is immediate. We know by that trial ourselves, that this remedy is effectual, safe and simple. One of our best Chester county farmers, when his cows have hoven, tells us he uses a *broom-handle* in the same way, because quick action is necessary, and this is soonest at hand. Any thing *binding* on the corners of the mouth, so as to excite action of the jaws of the animal to get rid of it, will answer.

The Naturalist.

OUR FUR-BEARING ANIMALS—III.

COMMON AMERICAN WILD CAT.

(Lynx Rufus—AUDUBON.)

This animal is found in all portions of North America, from the tropics to the sixtieth degree of latitude, but it appears in more abundance in the Gulf States. The length of its body is thirty inches; of its tail five and a half; its head is round; ears large, triangular, erect, tipped with coarse hairs an inch long, which drop out in Summer; a ruff of elongated hair surrounds the throat; body rather slender; legs long and muscular; soles of feet naked; hind feet webbed nearly to the claws; tail short, slightly turned up. Though there is a great diversity of color, even in individuals of the same locality, yet the prevailing color is reddish-brown in Fall and Winter, ashy-brown in Spring and Summer; forehead striped with dark brown; yellow eyes, encircled with a whitish band; a whitish triangular spot on hinder part of ear, bordered with black; ruff black; hind head and back yellowish-brown, with a dorsal line of dark brown; sides spotted with dark brown; under surface of body yellowish-white, spotted with black; legs somewhat darker; tail, above, barred with rufous and black, a broad band of black at the end, tipped white, below, light gray.

The Bay Lynx, as this cat is called, is fond of swampy, retired situations, as well as wooded hillsides. Cane brakes and deserted cotton plantations are its favorite localities. Its home is sometimes under an old, vine-covered log, but more frequently in a hollow tree, often entering an opening thirty feet high, or a cavity at the root is chosen. It makes a comfortable lair with long moss and dried leaves.

AUDUBON says, "The Wild Cat pursues his prey with activity and cunning, sometimes bounding suddenly upon the object of his rapacity; sometimes, with stealthy pace, approaching it in the darkness of the night, seizing it with his strong retractile claws and sharp teeth, and bearing it off to his retreat in the forest." He feeds on rabbits, rats and other small quadrupeds, on fish found in dry beds of streams, and does as much mischief among pigs and poultry as a dozen foxes. He is exceedingly fond of eggs, and never finds a nest without sucking every egg in it, and, if possible, will seize young and old birds of many species, capturing a wild turkey or partridge with great cunning and rapidity. Though night is his favorite time for procuring food, yet he is often seen abroad in search of prey in full sunshine, both in Winter and Summer. Its young are produced early in Spring, two to four in a litter.

The Wild Cat is easily caught in a log, box, or steel trap, and it is often hunted with fox hounds and gives excellent sport to the hunter. When pursued, if possible, he will weary the dogs by making short turns in almost impassable swamps or briar patches; at other times he will take to a tree with great agility where he will squat still, close to a branch, from whence, usually, a fatal ball brings him to earth.

The skins are quoted from 25 to 50 cents. This animal is generally in fine order; the meat is white and appears like veal, and when cooked is pronounced delicious. So AUDUBON states, but we don't understand why its flesh should be more fit for human food than that of any other cat; however, if any one desires it he is welcome to our share. H.

NOTES FOR NATURALISTS.

To What Age Do Birds Live.—The Brunswick Telegraph says:—Mr. J. W. TEDFORD of Topsham informed us the other day that for *twenty-eight* years in succession a bird (he does not assert that it is the same one, only always the same species) has built an ordinary nest of mud and wool in his barn. In 1861 the barn was nearly rebuilt, and the bird remained and built her nest in the part not renewed. He further says that it is his belief so far as he watched the brooding, that not a nest of birds has ever left the barn, as the cats have caught and eaten them while young. In several cases has the mother bird rebuilt and hatched a second time during the season. He says in reply to our query that the bird is not a swallow but what it is he does not recognize. The facts are curious enough at all events.

Floricultural.

SCARLET PIMPERNEL.

INCLOSED please find a specimen of a plant (I believe to be Scarlet Pimpernel) called Tame Chickweed here, and is called a remedy for rattlesnake bite. I know of two instances where given to two different dogs, each having been bitten, and was suffering severely. One was bitten twice by the snake—once on the lip and once on the throat. The latter had suffered for five or six hours, and the throat and head were badly swollen, and could scarcely breathe when the tea was administered. The other had not been under the influence so long, but was weakened down so that he could be easily handled, and suffered severely to all appearance; but in fifteen minutes after the tea was administered, became so much easier as to cease moaning. They both recovered rapidly; but whether from the effects of the weed or not, I wot not.

That it is a remedy for insect stings I know. To take the green leaves, pulverize them between the fingers, then rub into the wound, and, as by magic, all pain ceases.

I write this, thinking that it might be a remedy for the sting of that insect of the South that was brought to the notice of your readers in 1870, called the "Cow Killer," if I mistake not. Has any one tried it as a remedy for it? Is it the *Anagallis arvensis?* If so, is it the plant spoken of as being so fatal to dogs, on page 262, in one of the October numbers of 1870? It has a seed-pod like the Portulacca. The corolla is not scarlet, but dull red, with purple eye.

E. A. C.

Brownsville, Oregon.

THE plant you inclose is the *Anagallis arvensis*, and is known in Europe (where it grows wild almost everywhere) as Scarlet Pimpernel. We know nothing of its medicinal virtues, except what we find in medicinal works. LINDLEY, in his Medical Botany, page 368, says:—"This plant has some reputation in case of madness. It has also been prescribed in epilepsy and dropsy."

FLORICULTURAL NOTES.

California Lilly.—The leaf and seed of California Lily received from J. H. L. resemble very much the *L. superbum* of the Eastern States; and we think it is that species, or only a variety. There are, however, a few distinct species of lilies in California, and we believe that some of our nurserymen are propagating them for sale.

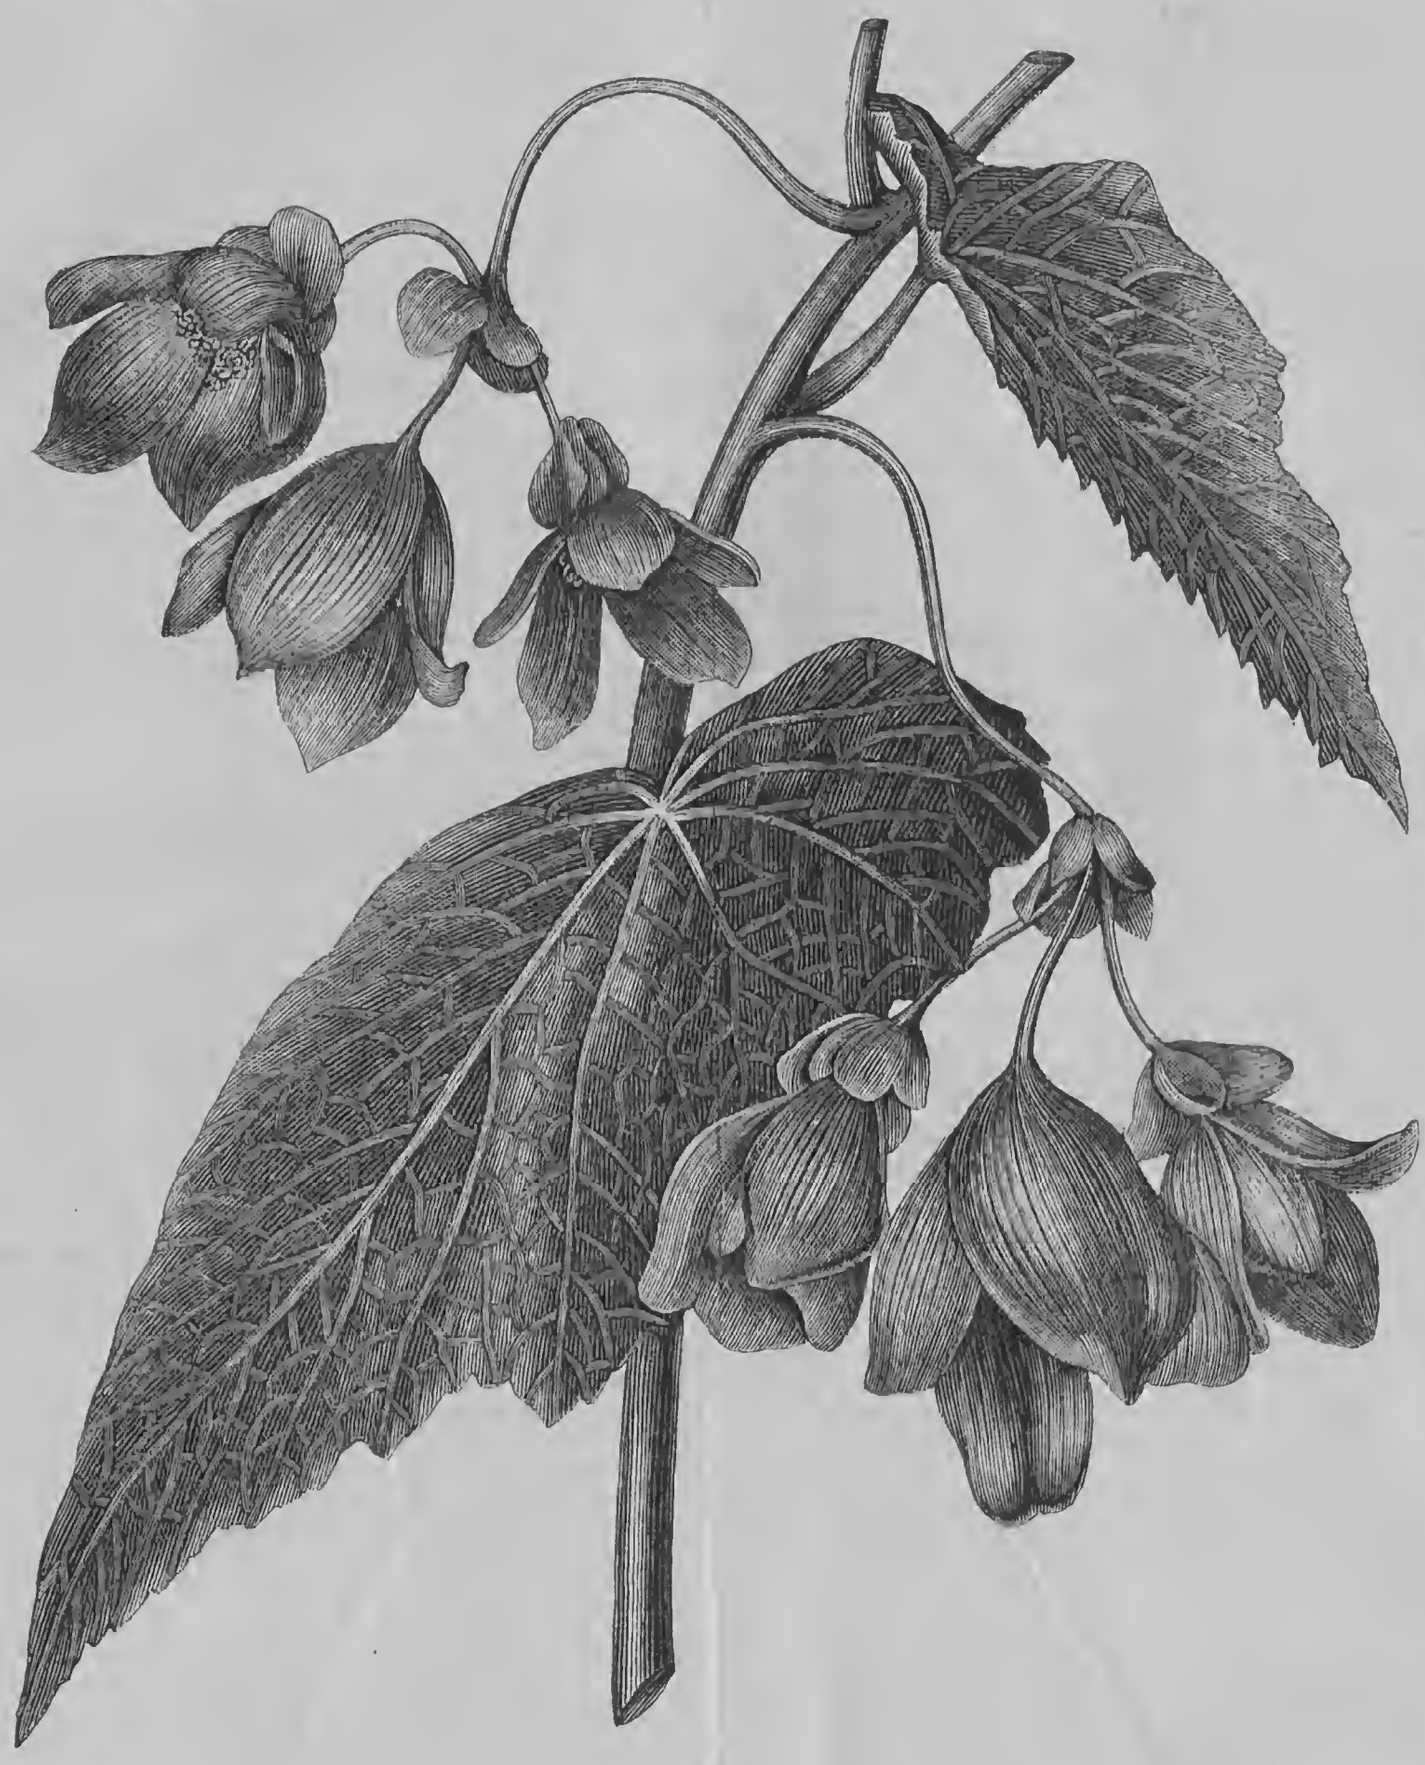
Begonia Haageana.—This new Begonia, originated by CARL MATHIEU, Berlin, Prussia, is a cross of *Begonia boliviensis* and *B. Pearcei*. It was sold by Mr. MATHIEU to Messrs. HAAGE & SCHMIDT, Erfurt, Germany, who gave it the above name. It is less noticeable for the beauty of its foliage than for its flower, which is a bright orange in color, like the *Boliviensis*, the form of its leaves resembling those of *Pearcei*. It is a summer bloomer; must be kept at rest in winter. It attains a size of from one and a-half to three feet in hight. The engraving is from a photograph reduced in size. The flower is very rich; and from the beginning of June until late Autumn it blooms continuously. In Germany it is highly esteemed. Being new, it is worthy the attention of American florists.

The Blue Glass Theory.—M. DUCHARTRE has an article in the bulletin of the French Central Horticultural Society on General PLEASANTON'S paper, in which he says only that the genuineness of the paper is vouched for on respectable testimony, he should regard it as a hoax.

Amaranths in Connecticut.—Please inform DICK HOPSON, Sherman, Texas, that I have an *Amaranthus atoprupurens* that stands ten feet three inches high, with flower spikes and side branches to correspond, and still growing; the amount of seed it will bear time will determine—I presume enough to seed the entire town.—L. LEACH, *Stonington, Conn.*

Strawberry-Blight.—Find inclosed a plant for name.—WM. HUNTER.

THE long, slender stem, with soft berry-like fruit, of a reddish color upon it, is known as strawberry-blight in some localities, but its botanical name is *Blitum capitatum*. We do not know that it has any particular value except for children to play with.



BEGONIA HAAGEANA.

Pomological.

PROGRESS IN POMOLOGY.

Siberian Crab Apples.—Could a sufficient number of our very best apples, such, for instance as the Early harvest, Sweet Bough, Baldwin, R. I. Greening, Seek-no-further and Lady Apple, be grown with certainty and in perfection throughout every portion of our wide country—it might seem that there would be then but very little room for improvement in that department of Pomology. But would such be the case? Can we conceive of no desirable additions to our lists even in those sections where our best fruits are ordinarily reliable? This certainly is making the strongest possible concession to those who oppose the introduction of peculiar fruits for particular localities. For we even have old fogies in fruit culture—men who would have us believe that nature has no "*germins*" locked in her secret cuisine which can produce fruits capable of affording new delights and new sources of sustenance and abundance. But as neither nature nor science can brook a boundary in the line of improvement, it is safe to conclude that even when put upon such liberal grounds, the above question must be answered in the affirmative.

To some it may be a surprise to announce that new fruits have already found their way into our markets which are quietly solving the question by the reports of veracious figures. The prices paid for fruits when in direct and continuous competition with others of the same season and in the same markets ought to decide their relative value for the purposes required. For whatever may be said to the contrary, poor fruits cannot long sustain themselves in competition with good, when both are equally abundant in market. The reason why bright-colored but coarse apples are so largely sold, is because they are more easily produced and are brought to market in larger qantities—while the dull, delicious ones are either not in market at the same prices, or else have not become known—otherwise they would sell in spite of their more gaudy competitors. At least we are sure it is so at the West. The R. I. Greening, though destitute of color, always sells in preference to any red apple. Rawle's Janet is no beauty, yet in regions where it abounds no apple can compete with it, even from the fruit stand.

But this principle of the popular estimate of fruits by their appearance certainly does not operate in favor of the class of fruits to which we wish to call attention. All varieties of the Siberian apples are small to begin with. The newer varieties are very little known. When placed in market alongside of well-known varieties of the common apple, they are obliged to overcome the immense advantage of large size—an element as attractive in big apples as it is in "big men," and we might add sometimes as deceptive. Siberian apples, like women, may be small and handsome, but if, like them, they are not also good for use as well as ornament, they will be neglected in the market—at least on further acquaintance.

To show that the Siberian species is not without grounds of favorable comparison with the common apple in point of quality and marketable value, we might give, at great length, names, dates, places, quantities and prices at which these apples have been sold, but cannot in this article. A few will suffice. Mr. A. SHARPE, an extensive fruit grower at Lockport, N. Y., in the very center of a splendid fruit section, raises Transcendent Crab apples and sells them at good prices. Messrs. MANN & SHARPE of Roxbury, Vt., sent twenty barrels of Transcendents to Boston in 1869, and realized $15 per barrel for them. Mr. H. C. RAYMOND of Council Bluffs, Iowa, states that both in that place and in Burlington, Iowa, another fine apple region, Transcendents sell for $4 per bushel. The markets of St. Paul and Chicago are always well supplied with the best apples grown in Michigan, Ohio and New York; yet D. S. DUNNING of Jefferson, Cook Co., Ill., sells these apples annually in Chicago at $3 to $4.50 per bushel, while the average price of the best large apples is $4 to $6 per barrel. The same preference is shown in St. Paul, and in all the markets of the Northwest.

Now, it would be sheer insanity to suppose that mere beauty and novelty, without intrinsic value, could induce the people of these well supplied fruit markets to pay such disproportionate prices for really poor fruits.

It may be asked, what are the qualities which recommend these fruits? Superior richness for all kinds of cooking purposes, and cheapness of preparation for use, are the principal ones in the case of the Transcendent. Yet there are very many Siberian apples that are good dessert fruits; and, unlike the Lady apple, which is only valuable as a fancy dessert fruit, these apples, while fully equal to it in beauty and quality for the dessert, are also superior cooking fruits, a very important item, and one that pertains to but few of the larger apples. Dr. HULL of Alton, Ill., admitted, on actual test, that one of these improved Siberians was superior to the Maiden's Blush as a cooking fruit.

These facts prove conclusively that even in the best provided places the improved varieties of this species of the apple are being acknowledged as decided additions to the pomological treasures of the country.

I am aware that it is in its relations to the extreme North that the Siberian species is so very generally referred to as the harbinger of pomological progress. While its importance to those regions can scarcely be exaggerated, yet, if we were to claim any merit for originality in this discussion, it would be for asserting that the improvement of this species was destined to make innovations upon the pomology of the whole country, and (without rivaling or displacing any of our best fruits) to make such desirable additions to it as to form a decided epoch in the progress of that ennobling art

> Which does mend nature—change it rather; but
> The art itself is nature.

Marengo, Ill. C. ANDREWS.

POMOLOGICAL GOSSIP.

The Hesper Blush Crab Apple is described as a Summer apple, about the size of the Lady apple, and nearly its equal in beauty. It is round or slightly oblong, a light yellow ground, striped on the sunny side with light red. Those who have tasted it regard it as about as good as the Yellow Harvest.

Transcendent Crab.—THOMAS CORNS, Rock Island Co., Ill. The crab apple you send us is Transcendent.

Scientific and Useful.

THE EAST RIVER BRIDGE AND ITS CAISSON.

A CORRESPONDENT having read that "the force employed to sink the caisson is obtained by piling stones upon it, in the shape of masonry, destined to form a portion of the pier which is to be built," writes thus: "This being so, the caisson will have to bear the whole weight of that portion of the bridge, and when the caisson decays what then?" As we have frequently heard remarks of this kind, it would appear that the construction of the caisson and the office which it performs in the building of the piers is not generally understood by the public at large. Let us, therefore, explain:

The piers of the East River Bridge are structures of very unusual size. The masonry foundation at the base measures 75 by 149 feet, and the towers rise to a hight of 278 feet above high water level. Let us compare this with a few famous and well-known structures. The City Column in London is 202 feet high; the Napoleon Column, Paris, 132 feet; the Dome of the Capitol at Washington, 287 feet, and Trinity Church spire, 286 feet. It is evident, therefore, that a structure having the hight of these bridge towers combined with their massiveness must be of enormous weight, and when to the weight of the towers themselves we add the weight of the suspension ropes, roadway and load, it is obvious that the foundation must be very firm and based upon either solid rock or something quite as substantial. Now, the foundations of these piers are laid at a depth of forty or fifty feet below the surface of the river, and the problem was, how to get them down there?

The simplest and cheapest method was, undoubtedly, that which has been adopted—the employment of caissons. These caissons (of which two are employed, one at each side,) are little else than large diving-bells made of wood and iron, and measuring 168 feet long by 102 feet wide, while their weight is 2,500 tons. But even with this weight they would not sink, and, therefore, there was piled on them, to begin with, fifteen courses of timber and concrete, and on that several courses of masonry in blocks of very large dimensions. As soon as the caisson, which is a huge wooden box with air-tight sides, ends and top, but no bottom, had reached the bed of the river, air was forced in by means of pumps driven by powerful steam engines, and in this way the water was all driven out, just as occurs in a diving-bell. The men then went to work to remove all soft, loose material and soil, so that the caisson might sink still further and finally reach "hard pan." This process was carried on as far as was deemed necessary, the sand, soil, gravel and boulders being removed through tubes arranged for the purpose. When a good solid stratum had been reached, the sinking process was stopped and the caisson was then filled up with concrete of the best description. So that the piers and all that they support do not rest upon a hollow wooden box, but upon a solid block of hard concrete, measuring 168 feet long, 102 feet wide, 29 feet thick and weighing over 17,000 tons! Our correspondent need, therefore, have no fear that the caisson will "cave in;" as well might we expect a steam boiler with a full head of steam on to cave in. As for the timber that is present, compared with the masonry and concrete in which it is embedded, it is a mere bagatelle, and if it should compress would not cause any marked settling; but when we remember that wooden piles driven under water by the Romans have remained in a state of perfect preservation until the present day, we need have but little fear that these timbers will decay at a depth of nearly thirty feet below the surface of the river.

HOW THE BLIND MAY CORRESPOND.

AT a recent meeting of the Royal Scottish Society of Arts, a communication was read from Mr. ALBERT MELDRUM, teacher of the blind, Alloa, describing an improved method of corresponding between blind persons. The invention consists of two parts—the upper having the types, with keys and levers for moving them, and the lower containing the paper-moving apparatus. The base of the upper part is a metal disk, with a circular hole in the center. Around the central opening are arranged twenty-six little hammers, having on their striking surface copper types for embossing the paper. The types are so arranged that they all strike at the same place, namely, on the opening in the disk, and each hammer, after striking, is pulled back to its original position by an India rubber band. Each of the keys represents a letter, and when any particular key is pressed down, the corresponding hammer strikes, and the type makes a mark on the paper, which is stretched on a revolving drum in a drawer below the disk. When one letter is impressed the drum is moved round by a handle in front of the machine, and a plain surface is presented for the next stroke. When a line is finished, the drawer in which the paper moves is pulled out one line. The machine is constructed to print MOON'S type, but its principle is equally applicable to any other, especially to BRAILE'S. After the paper had been read, the machine was exhibited in operation, and worked very satisfactorily.

SCIENTIFIC AND USEFUL NOTES.

To Measure Grain in a Bin.—A correspondent of the Rural Carolinian gives the following rule:—First get the actual number of *cubic feet*, which is done by multiplying the interior length, breadth and depth together, then eight-tenths of the cubic feet will be the number of bushels that the bin will contain, or eight-tenths of the cubic feet of grain will be the number of bushels. To get eight-tenths, multiply the cubic feet by eight, (8) place a period before the first right hand figure, and you have the bushels and the tenths of the bushels. If you measure corn on the cob, allow one-half for the cob, so that four-tenths of the cubic feet will be the number of bushels of shelled corn. Illustrate: Bin 10 x 10 x 10 feet, multiply these together, product (1,000) one thousand; of which sum eight-tenths or 0.8 will be bushels, and four-tenths or 0.4 if corn in the ear; that is, 800 or 400 bushels, as the corn may be shelled or on the cob.

Rat Killing.—I herewith send you my experience in rat killing, which was suggested to me last Spring by a friend. I got ten cents' worth of Arsenic; mixed with flour; made a paste and spread it upon small pieces of paper, such as the leaves of an old almanac; rolled up into balls, and wherever I found a rat hole put one into it. The premises were soon cleared of them; for every rat about, in passing to and fro, naturally stopped and took a nibble. They soon searched for water and soon died. This is one of the best methods of destroying rats about my premises I have ever tried.—I. F. EMORY.

OUR objection to this and all other rat poisons is, that if the rats can get water, as they often may, without leaving their seclusion, they die there, in the walls, cellars, etc., and in places where they are not accessible and cannot be removed. We have known homes rendered uninhabitable by this very process, and advise our readers not to attempt it, especially about dwelling houses.

How to Make Whitewash.—A cheap and simple mode is, to put unslaked lime—that which is in the form of the original rock—in a vessel, pour boiling water on until covered; place a cloth over the vessel, so as to confine the most minute particles of the lime, they being the ones which most perfectly penetrate the surfaces to which wash is applied, and consequently remain the longest. Afterward dilute the wash to the consistence of thick cream, and apply it thoroughly and thickly, thus securing a white, light-giving surface, with a body capable of absorbing, and thus rendering harmless, the bad air and gases which may be formed in the cellar, as also in the poultry, the meat, and other outhouses in the vicinity of the dwelling.

Cement for Leather.—A good material for cementing leather, is made of ten parts sulphide of carbon, one part of oil of turpentine with enough gutta percha to make a thick, flowing liquid. Leather filled with grease cannot be cemented as it should be, and where the parts to be united contain oil, trim them well, fold a cloth over them, and apply a hot iron for a short time, then apply, the cement to both parts, and press together until entirely dry

How to select Glue.—When selecting glue choose that which has a clear, transparent look, free from clouds or spots, and of a reddish-yellow cast, without bad taste or smell. The quality of glue may be very well determined before using, by putting a piece in cold water, for that which is good will swell, but not dissolve. Good glue will only become soluble in water when heated to a boiling point.

Hygienic Information.

DYSPEPSIA REMEDY.

HAVING been a great sufferer with dyspepsia, perhaps I can offer some suggestions that may be of value to D. A. WHITE. He desires symptoms, treatment, etc. For more than two years I ate no pleasant bread. One ounce of the most delicate food gave me pain. It lay in my stomach like a ball of lead; great tenderness at the pit of the stomach; a sense of fullness and great oppression after eating; no burning or acidity whatever. One correspondent tells the inquirer nothing sour should be eaten. My first step towards convalescence was brought by eating uncooked tomatoes, served up in vinegar and sugar. My fare for five months, previous to the ripening of the tomatoes, was for each meal about 1½ ounces of Graham bread dried in the oven to a crisp, softened with a little weak broth or slightly salted warm water. Even that exhausted all my strength to digest it. You may be sure my surprise was great to find that tomatoes agreed with me. After eating them two weeks I was able to increase my fare to 2½ ounces each meal. I found sliced lemon, with a sprinkling of sugar, a fine relish and a good aid to digestion. Very likely there was a great lack of gastric juice and the acid of the lemon caused it to flow or acted itself the part of the wanting fluid.

Now this treatment clashes with the advice of the individual referred to. It is nevertheless true that one person may suffer from too much acid in the stomach, while another is as badly afflicted with too little. In the one case something sour should be taken while the other must avoid all things sour. After meals I had needle pains shooting through my chest. They were removed by taking two bottles of Lindsey's Blood Purifier. I found medical treatment of little use. I will refer Mr. WHITE to a letter in the RURAL NEW-YORKER, written by Mr. MASON of New York, in answer to an appeal made by myself through its columns. That letter proved my crowning joy. This sentence of my kind unknown friend, "*Beware of eating too much*," has been my mental monitor at every meal. I often found one morsel a great deal too much. The dyspeptic may take pills, nostrums and bitters, *ad infinitum*, and unless he adheres strictly to the above rule he will never get cured. The stomach needs rest. Also leave off doing what has caused it to become weakened. Dr. LEROY SUNDERLAND, Quincy, Mass., would tell Mr. W. to live on a sixpence a day. He asserts that he has known the worst cases of dyspepsia cured without a particle of medicine—simply by eating just what agrees with you, and never eating until you are hungry, nor eat as long as you are hungry. This I believe to be about the entire *modus operandi* in the dyspepsia cure. I send a good prescription:—Take before each meal a dessert spoonful of weak ley, made from the ashes of the bark of the shag-bark hickory tree (*Carya alba*), and after meals, or while eating, one-half teaspoonful of white mustard seed.

Painesville, O. S. J. D.

HYGIENIC NOTES AND QUERIES.

Canker Lettuce and Bronchitis.—Having read in your excellent paper an inquiry, made by a teacher, what would cure the bronchitis, I would say to him that wild lettuce, or canker root, known often as canker lettuce, or lettuce liverwort, is a sure cure for that disease in its first stages. Bronchitis is often caused by the catarrh; if so, that should be first cured. The tincture is prepared by filling a bottle with the herb; then apply all the alcohol the bottle will hold; set it in a warm place, and in two days it will be fit for use. When used, reduce the tincture one-half with pure water. Swallow a teaspoonful, then gargle the throat with tincture. Do this at bedtime, one or two nights; then wait a day or two; if not well, repeat the operation, and you may add the putting a flannel cloth of two or three thickness, saturated with the same. Repeat at intervals till well. White clothes should be protected by a cloth over the flannel.—A. C.

THE plant you inclose as Canker Lettuce is the quite common *Pyrola rotundifolia*. It may possess all the virtues you name, but we should advise those persons who are not familiar with wild plants to let them alone, inasmuch as there is danger of collecting species that would do more harm than good.

Remedy for Catarrh.—I had this distressing disease eight years or more. It made such a stench that my family could hardly bear me in their presence. One day I decided to try to cure myself. This is the experiment and the result:—I took a vial that would hold a gill and filled it nearly full of water; added to it a piece of alum the size of a common chestnut or hickory nut; to this I added 15 or 20 drops of Baker's Pain Panacea, making it as strong as it could be borne. It would be as well to pulverize the alum before putting it in the vial. After the alum is dissolved, turn out into the hand a teaspoonful or so of the mixture and snuff it up the nose two or three times; get it well up the nose. If it runs into the throat it does no harm; spit it out. Repeat this operation two or three times a day. This simple medicine cured me in about eight weeks or so. It is some six or eight years since I tried this, but I am all right now. It was worth more to me than the gold of India or Peru.—O. NETTLETON.

Salt in Food.—I am not of the "medical profession;" but as no M. D. has made the statement requested by W. H., I will "state" for his or her benefit that from experience and observation I have learned that salt should be used "sparingly" if used at all; and that the habit which most people have of salting many kinds of food until it is difficult to tell from the taste which is salt and which is food, is altogether against health, common sense and reason. No eatables, excepting meat and vegetables, are made any the better by salting; and with these it should only be used in small quantities. Its use in large quantities is especially hurtful to people having salt rheum, or scrofulous humors of any kind. Some of the healthiest, hardest working people whom I know discard its use entirely, excepting in butter, which proves to me that its prevalent use is more a habit than a necessity.—GERALDINE GERMANE.

Hydrate of Chloral and Rattlesnake Poison.—Hydrate of chloral seems to develop fresh virtues everyday. A case of rattlesnake poison has lately been cured by it, at Point Pleasant N. J. A young man bitten by the rattlesnake, and exhibing the usual violent and alarming symptoms, was treated with the hydrate, five doses of twenty grains each being administered, when sleep followed, and the patient awoke after several hours with every symptom of the poison gone. At the same time we would warn non-professional persons against tampering with this powerful agent, the officinal strength of which does not seem to have been agreed upon by the pharmaceutists.

Hydrophobia "Remedies."—The following (said to be) summary of cures of hydrophobia are given in the columns of a contemporary;—"When a patient is seized with this disease, 1. Inject morphine under the skin. 2. Give half a dram of powdered castor internally. 3. Administer small quantities of chloroform by inhalation. 4. Wrap the patient in blankets saturated with a warm solution nitrate ammonia. 5. Apply oil of Juniper externally. 6. Administer vapor baths. 7. Put the patient upon a diet of raw onions. 8. Try the mad-stone, if you can get a specimen of it. If the dog was mad, this stone will adhere to the wound.

To Cure Corns.—In RURAL NEW-YORKER of August 24 a correspondent asks how to cure corns and get rid of them. I have tried pearl shirt buttons, dissolved in lemon juice—say four or five buttons to the juice of one lemon; bottle it for use; it takes a few days to dissolve.—SUSIE BOYD, *Hyde Park, Mass.*

Remedy for Corns.—In answer to an inquiry in the RURAL NEW-YORKER for a cure for corns, I would recommend Gargling Oil to all those suffering with corns. Try it, and if it has the same result with them that it had with me and with members of my family, they will have reason to rejoice.—H. P. GORTON.

Bullocks' Blood is much taken by Parisians for anæmia and pulmonary phthisis—patients of both sexes, of all ranks and ages flocking to the slaughter houses every morning to drink of the still fuming blood of oxen slaughtered for the table. It contains a great quantity of iron, hence its value.

Vaccination.—Young America asks whether vaccination ought to be renewed every seven years or not. It certainly ought as often as that, and some physicians recommend it every two years—whether to get the accompanying fee or not, we cannot say.

Domestic Economy.

ODDS AND ENDS.

Drying Pumpkins.—We do not know the origin of the following, or we would credit it:—We have tried all modes of drying, but no plan is equal, we think, to this: "Take the ripe pumpkins, pare, cut into small pieces, stew soft, mash and strain through a cullender, as if for making pies. Spread this pulp on plates in layers not quite an inch thick; dry it down in the stove oven, keep at so low a temperature as not to scorch it. In about a day it will become dry and crisp. The sheets thus made can be stored away in a dry place, and they are always ready for use for pies or sauce. Soak the pieces over night in a little milk, and they will return to a nice pulp, as delicious as the fresh pumpkin—we think much more so. The quick drying after cooking, prevents any portion from slightly souring, as is always the case when the uncooked pieces are dried; the flavor is much better preserved, and after cooking is saved. This plan is quite as little trouble as the old mode, to say nothing of the superiority in the quality of the material obtained. Try it and you will not return to the old method, we are sure, and you will also become a great lover of pumpkin pie, all the year round."

Potatoes Boiled or Steamed.—It is stated that potatoes become watery from being covered with a weight of water, and that, moreover, the particles are not able to expand and burst into flour. I venture to challenge that assertion. Potato flour is not so easily compressed as all that. I should like to see the pot of water big enough to prevent the potato flour from bursting during the process of boiling. Very little water indeed can enter the potato during the process of cooking; and as for its weight it is virtually inoperative. Potatoes boiled are almost as floury as potatoes steamed, if the boiling has been properly done, and they are better flavored. This is my argument for boiling—the potatoes are sweeter. Does any one doubt it? then let him try a draught of potato water, and doubt no more. Where does the water pick up that loathsome flavor? Assuredly from the potatoes in the process of boiling. And the potatoes must needs be better for the loss; and they are. I thought otherwise at one time, but I am now fully convinced that the best mode of cooking potatoes is boiling them. This mode of boiling is good. But one water—a liberal supply—with a handful of salt, will finish them in style, without the trouble of several changes.—D. T. F., *In Gardener.*

Cider Vinegar Pickles.—Take 100 nice cucumbers, turn boiling water over them three mornings in succession. The second morning throw in a handful of salt. There should be water enough to cover them nicely. The fourth morning remove them to your pickle jar; have ready enough good cider vinegar to cover them, with a table spoonful of alum, a handful of cinnamon and cloves, as much horse-radish, cut in pieces; put over the fire, bring all to a scald, turn over the pickles, cover tight and set away for use. They are warranted to keep a year, or till they are eaten up. Try them. —M. A. HOME.

Drying Sweet Corn.—The following recipe for drying sweet corn I find so much better than the old method of cooking and cutting off the cob, that I thought it might be of use to your readers:—Take the corn when it is fit for boiling; boil ten minutes; take a sharp knife, shave off the kernels by taking a very thin slice, just as you would for succotash, but not thick enough to take off the cob; then with the back of the knife scrape the corn off the cob and put on plates; keep as warm as possible without scorching, stirring it frequently.—MARY J. SCOTT.

To Fry Potatoes.—Tell Mr. JOSH BROWN that my way to fry potatoes is to slice them about half an inch thick, fry in a little meat drippings, over a brisk fire until they are brown. Lay but one layer in the pan, season with salt, while frying, and cover tight. Eat immediately after they are done. JOSH, let us know if this suits.—A POTATO LOVER, *North Platte, Neb.*

Domestic Inquiries.—"Young Housekeeper" asks how to rid der pantry of red ants. . . . Will LORETTA E. KNAPP, No. Fairfield, O., please inform me how she colors blue permanently with Prussian blue and alum?—SUBSCRIBER.

EXTRA INDUCEMENTS.—We will furnish FOR EVERYBODY and its Premiums and the RURAL NEW-YORKER with its Premium for Only Five Dollars, if subscription is sent previous to November 1st.

Fashions for Fall and Winter.

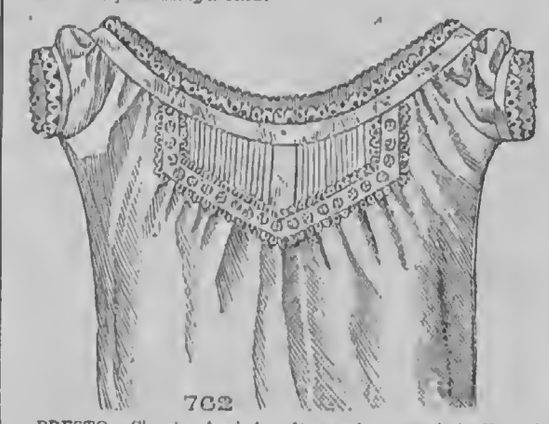
1170

GODIVA. This Polonaise is one of our latest Paris Novelties. It contains many new and very valuable features. Without looping it can be worn as a long tight-fitting basque, or looped (as shown in cut) it is a most elegant Polonaise. The ornamental back piece passes over the shoulders and forms a neat fast cape in front and is "adjustable;" may be worn or not as fancy dictates, thus constituting *two* entirely different Polonaises in appearance. The back piece is sometimes made in velvet or satin, and richly trimmed, and completes a brilliant toilet when worn with a house dress. Besides its beautiful variations it is well adapted to any material. Takes six yards of 24 inch goods. Price of pattern with cloth model ONE DOLLAR. See PREMIUM OFFER below.

1165

NEW FALL WRAP, is a sacque and cape, with a thribble box-pleat laid on the under side in the back, and in place of the broad pleat of last season; just the three edges are visible from each side, giving the appearance of six round folds, the cape slopes gracefully to the back, and is left open to trim. The sacque has a large sleeve, which can be used or not, as weather or comfort demand.

We give this as one of the very best for fall and winter cloak made in either velvet or cloth. The original is of dark blue ladies' cloth. Scolloped and bound with velvet and velvet buttons. Takes three yards of ladies' cloth. Pattern, with cloth model, 50 cents. *See premium offer below.*



762

PRESTO. Chemise for lady. Its great success in leading all other styles is owing to its perfect fitting band and sleeve. The curved arm-size is an improvement of *much* value, as it will not *cut* the shoulder or *bind* the arm, and also avoids the homely, perplexing gusset. Takes three yards linen for medium-size. Pattern, with cloth model, 25 cents. See Premium below.

We give a CLOTH MODEL with each pattern which SHOWS every seam, pleat, gather, loop, etc., how to put the garment together by the pattern, and how it will look when completed. By the use of our Cloth Models any person who can sew can FINISH the most difficult garment as easily as the plainest. They are PERFECT GUIDES.

Premium Offer!

If you write the following, viz.:

[RURAL, 1170, 1165, 762,]

and sign your name, giving your P. O., Co. and State, and then inclose it, with *One Dollar* and *Ten Cents*, to us, we will make you a *yearly* subscriber to *Smith's Illustrated Pattern Bazaar* (begin with the present No.), and send to you by return mail *all* the patterns, with cloth models complete, of the *three* above engravings, *as premium. Now* is the time to *Subscribe!*

Either of the above patterns sent by mail upon receipt of its marked price.

A NEW QUARTER of the RURAL begins next week, Oct. 5, the Thirteen Numbers of which we will send, ON TRIAL, for Only FIFTY CENTS. For inducements to those forming clubs see last column of this page.

FAIR GOING.—THE NEW JERSEY FAIR.

WE visited the Fair Grounds of the New Jersey State Agricultural Society, the other day. It was a delightful day and the second one of the Fair; but the attendance was small until the middle of the afternoon and later, when the Newark citizens began to arrive in their carriages to see the horse trot. And the trotting seemed to be the chief attraction to visitors, although there were other objects to see and study.

There was a meager show of agricultural implements and machinery—not one-fifth as large as we have seen at some County Fairs. In the manufacturers' hall were a few interesting objects, with the usual display of carriages, chamber and parlor furniture, sewing machines, etc. Butter, cheese, bread, canned and preserved fruits were scarce.

The live stock department was somewhat more creditable. Poultry in variety, pigeons, lop-eared rabbits, etc., attracted the attention of a few curious beings. There were a few Short-Horn and Devon animals; a very good and more extensive display of Alderney bulls and cows; a not extensive show of pigs, a few middle and long-wooled sheep, and no end of horses (chiefly trotting stock), which were carefully locked in from view. But what a dearth of visitors there was about these animals, "my countrymen!" Cows, pigs, poultry and sheep seemed to have lost their attractions, and the forlorn exhibitors rode their breeches pockets disconsolately, wondering "what an Agricultural Fair is for, anyhow."

Then there was a beautiful tent with a fair exhibition of fruits, plants, vegetables and grains—nothing extra, and not so thronged at any time we were in it that we could not have counted the noses of every person there without moving from our position. It was the horse trot they wanted to see; and it was asserted that the people were "holding back for to-morrow, when Gen. GRANT is to be here, and there is to be some lively trotting."

Now it is all glorious!—to get out into the sunlight, tread the beautiful grounds, see the people, watch the comical phases of human nature which are exhibited, and see the horses trot! The inquiry forced upon us is, "Do the people visit Agricultural Fairs to learn or to be amused? Do they want anything but recreation and release from care?" The spirit of inquiry seems wholly subordinate to what our friend THURBER calls, "these Gospel horse trots"—which the good, orthodox people may visit and see the fun without being charged with having been seen at a race course!

Do we feel bad about it? Are we complaining because the people of the Empire of New Jersey like fun at Fairs? Not a bit of it! We are only reporting facts; and they will take care of themselves. We went to see something agricultural, to meet agriculturists—men who should manifest a lively interest in the progress of their industry in the State, as illustrated in the products exhibited—who should be searching for something new and useful in the exhibition halls, among the implements, quizzing the herdsmen and shepherds, and telling each other what they do and how they do it. But we did not find 'em. We believe New Jersey has such men, but we saw few of them. Where were they? And why were they not at their State Fair?

AM. INST. FARMERS' CLUB.

SEPTEMBER 13, the Club met the third time since vacation. The attendance was only moderate. The first subject presented was an inquiry about

Transplanting Evergreens.

One member had transplanted them at all seasons of the year, and had succeeded in the Fall as well as at any time. He would transplant Hemlock early in Spring—before frost is out. It is more difficult to transplant than other evergreens. ANDREW S. FULLER replied that no man who wants his evergreens to live will transplant in the Fall, but as early as possible in the Spring. Nurserymen who recommend Fall transplanting, either do not know their business or desire their customers' trees to die. It is not enough that an evergreen transplanted in the Fall has the soil compactly about its roots. It must have *made root growth* in the Fall if it lives through the Winter. Evaporation is constantly going on during Winter through the foliage; the roots must supply the material for this evaporation. Simple contact with the soil does not enable them to do this—they must have grown into the soil. With deciduous trees the case is different. There is no evaporation from the foliage in Winter, and it is not, therefore, necessary they should have made Fall growth.

European Observations.

Dr. J. V. C. SMITH has just returned from Europe, and gave the Club some of his observations in Ireland, Wales, Scotland, and England. He asserts that "barns are an unknown convenience" in those countries. Hay and grain are stacked. Stacked hay, three or four years old, is regarded better than when freshly cut. The fences are usually hawthorn hedges. Fields are small. Farmers rarely own the lands they cultivate; and they cultivate better than with us, the farms being smaller and help more plenty. Two crops per year are grown whenever practicable. Fertilizers of every description are saved, or secured, and applied. Trees are extensively cultivated. "Horses of all work" are unknown. The Farm horse is an immense animal, adapted to draft purposes only. Few or no oxen are employed. The beef of England is better than American, says Dr. SMITH; it is not hastily fattened, old, worn-out cattle. Then the good Doctor made this assertion: "Half the beef in American markets is ox-beef and the carcasses of cattle considered as having mostly passed their usefulness." To this assertion was opposed one by a gentleman who knows something of the beef business of this country, that not one hundredth part of the beef consumed in this country is made upon animals of the character described by Dr. SMITH. This statement is also confirmed by a gentleman from Illinois. If Dr. SMITH'S observations abroad were no more critical than have been his observations at home, as evinced by this statement, they are not of much value to anybody.

Destroying the Canker Worm.

Dr. B. F. LONG, Alton, Ill., was present, and stated that he and his neighbors had succeeded in destroying the canker worm in orchards, by plowing them late in the Fall. But the plowing should not be over two inches deep—else the chrysalids will be buried too deep, and will be preserved and mature; but if the land is plowed shallow, the frost kills the chrysalid, and prevents a crop of worms the next season.

RURAL NOTES AND QUERIES.

Mortgages on the Farm.—J. R. S. writes:—"I have a farm clear of debt. I need a new house. Some of my neighbors have better houses than I have, and seem prosperous; but their farms were heavily mortgaged in order that they might build their comfortable cottages. My house is comfortable, but not as convenient and modern as it might be. Would you advise mortgaging the farm to raise the means to replace the old house with a new one? Your opinion will have much weight in deciding my action." In reply, we say *No!* Do not mortgage the farm for any such purpose. Lay aside a certain sum every year as a building fund. Let every thing that is available, without affecting the comfort and well-being of your family, be economized. Use every opportunity to gather the material for building. Get the lumber sawed as you find it convenient to do so. If you have the timber for the frame, cut it, get it hewed or sawed, and then carefully shelter it. Draw the stone for cellar or foundation walls. Accumulate and preserve carefully the material after you have decided what kind of a house you wish to build. Consult a good builder as to the material required. Get specifications, if possible, and work to them. By this means you can build and have a house paid for in less time, and with less labor and anxiety, than if you ran in debt to build it. We have watched both processes. Few men ever live to raise such mortgages off the farm; and few enjoy their new homes as keenly as those who know they are *paid for* when completed. Stick to the old house until the new one is built without debt; but do not delay building, if you need a house, in order to buy and pay for more land. Consider the comfort and convenience of your family first. Keep your children about you as long as you can, by giving them as attractive a home as possible. Make the wife contented, and relieve her of care and labor, by furnishing her with every possible modern convenience to aid in the discharge of her daily duties. But don't add to her nor your own burdens by mortgaging the farm.

The Large Farms of California are "not what they have been cracked up to be," according to the statements of a Mr. HOLLOWAY, who recently made a speech on the subject. He says the papers are full of trash about the fine crops raised and the value of the wheat on hand—all of which gives a false impression as to the actual state of things. Many farmers have not raised wheat enough to pay interest on what they could have sold their lands for. Wheat will not make California farmers rich. He says it is an evident fact that if men do their own work their lands produce better than if cultivated by others in large tracts; and he advises cutting these large tracts into small farms. This he regards a patriotic duty, asserting that "to live on rented lands is the worst kind of slavery." Dry land renting at $5 per acre is $4.50 more than the renter can afford to pay. Another gentleman hit the nail on the head when he said his observation had taught him that it is the *man* more than the business which has to do with success or failure. Still, so far as the prosperity of the people of any State is concerned, we believe small farms are essential. It is not the money that is made so much as the permanent home anchorage that is secured; and every landholder becomes a sovereign, vitally interested in the peace, progress and prosperity of the State.

The Concussion Colonel.—Col. HARDEE of Florida, the discoverer of the concussion mode of destroying insects, made us a lively call the other day. He is just as sure as ever about the effects of concussion upon insect life. He insists, however, that the concussion must be produced *when the dew is on the foliage*. It has the same effect upon the insects that discharging a gun over water in which lies a pickerel has upon that fish—that's the end of 'em. But Col. HARDEE did not call to promote the cause of concussion. He is deeply absorbed in political matters and actively at work doing what he thinks best to relieve his State of some of the financial burthens which now weigh so heavily upon it.

The Rights of Exhibitors at Fairs was discussed in our presence the other day, by an officer of the New York State Agricultural Society, who asserted that not one-tenth of those who manage and attend Fairs, who are not themselves exhibitors, have any conception of the trouble and expense of making an exhibition of farm stock or produce; and this fact is doing more to injure Fairs, affect the extent and excellence of these exhibitions, and destroy their usefulness, than most people are apt to suppose. He had a feeling sense of what an exhibitor does, and a full sympathy with his feelings when he attends Fairs and receives little or no attention and compensation. This is a good thing for managers to think about.

Pounds vs. Bales.—The news from the cotton-growing States indicates a decrease in the cotton crop. But this estimate is numbered by bales. Now, what is a bale? When men talk of pounds we know what they mean; but bales mean any number of pounds from 450 to 600. There is no established weight as a standard for bales. Isn't it time there was, or that these estimates of the cotton crop should cease to be made in bales? Cotton factors note that bales, later years, are of greater weight than formerly. This is almost uniformly the case, it is said; so that the advertised decrease in the number of bales produced, does not necessarily mean a decreased aggregate product.

The British Harvest is not so good as it was believed it would be a few weeks since. Wheat is not shelling out as anticipated, and the potato crop is very seriously injured—so much so as to excite the liveliest apprehensions among food consumers. With the advance in coal, and the food prospects, things look gloomy for the poorer classes of Great Britain.

Frippery Figures.—The cost of fashionable frippery imported into this country from abroad, annually, is put down at forty millions of dollars. This is a tolerably good sum to go out of the country where men and women complain that they can find "nothing to do." Such persons should go abroad, learn a trade, and return home and start in business.

The Flower Garden.—This is the name of a new quarterly Magazine of Floral Progress, just issued by C. L. ALLEN & Co., Brooklyn, N. Y. It is a handsome pamphlet containing much floral information illustrative of the condition and progress of Floriculture. Price $1.

THE SEASON, CROPS, PRICES, ETC.

Greenleaf, Meeker Co, Minn., Sept. 3.—Weather extremely wet for more than two months. Upland hay splendid and abundant in consequence. Hay marshes considerably injured by drouth and fires of last year. Not much Timothy grown here yet, but it does well where it has been tried. The grain yields well, but would have been a better crop with less rain. All kinds of vegetation has grown very thriftily this year. Potatoes yield enormously, and good quality. Early Rose takes the lead; were not materially injured by the Colorado bugs, though they made their appearance as usual. Farmers have finished stacking grain, and many are threshing. Help very scarce during harvest and wages high; some paying $3 per day. Some grain lost for want of help.—E. B. S.

Meadow Creek, Montana, Sept. 1.—As near as I am able to judge from quite extended observation, the small grain crop is 30 to 40 per cent larger than ever before. Flour is retailing at $6.50 per sack, a thing hitherto unknown here. Oats are worth from 3 to 3½c. per lb., by the quantity. Potatoes vary in price from 1 to 2 cts. per lb., with some of the last year crop still on hand. On the whole this has been a remarkably productive year, notwithstanding the season has been unusually backward. If the frosts hold off ten days longer the harvest of the cereals will be complete. In some portions of the Territories there has been frosts that did considerable damage, but on the whole crops of all kinds are abundant.—J. D. K.

RURAL BREVITIES.

WHY will the Watertown (N. Y.) Reformer steal? It is as cheap to be honest.

A. R. R. is informed that the proceedings of the Swine Breeders' Convention will probably be extensively published.

THE St. Louis Ag. and Mech. Ass'n proposes to establish in St. Louis a grand Museum of Agriculture and the Arts, illustrative both of the resources and industry of the Great West.

THE Virginia correspondent who asks, is informed that, take the average of all cattle, natives and Texans, we call the average dressed weight about 700 lbs.; and that would be a fair average for three or four-year-old native Virginia cattle. Four-year-old grade Short-Horns should average 800 lbs.

THE Farmer and Gardener, Augusta, Ga., had suspended publication in consequence of the sudden death of Mr. E. H. GRAY, its owner and publisher; but it is to be continued by Mr. P. J. BERCKMANS, on his own account, and under his editorial management. We wish our friend the success he will deserve; for he will only tell what he *knows*—which is a good deal.

THE RURAL'S FALL CAMPAIGN!

ANOTHER TRIAL TRIP!

NEW QUARTER—NEXT YEAR.

A SPLENDID PREMIUM
FOR EVERYBODY!

THE RURAL NEW-YORKER is offered for the ensuing Three Months, from October to January, On Trial, for ONLY FIFTY CENTS; and for Fifteen Months—say from Oct. 1, 1872, to Jan. 1, 1874—for $3. This is giving Thirteen Numbers for Fifty Cents, and Sixty-Five Numbers for $3. To every person sending $3 for fifteen months, as above, or $5 for ten Trial Subscribers (from Oct. to Jan.) we will send as a Premium, postage paid, the Splendid Steel Engraving entitled

BIRTH-DAY MORNING,
OR THE GARDENER'S PRESENT.

Size 24x30—retail price $5. This beautiful engraving is illustrated (on a small scale) and described on page 193. Every non-subscriber to MOORE'S RURAL should note this announcement—and every subscriber can secure the picture by either obtaining ten Trial Subscribers, at 50 cents each, or subscribing for 15 months, (and selling or giving away the paper for the next three months, or until his present subscription expires.)

THIS RARE OFFER

Is worthy the attention and effort of every reader. The engraving is first class in every respect, and, if sold, would be worth at least $5 per copy; but copies are not for sale, and, as we own the plate, this beautiful and artistic Picture *can only be obtained by subscribing*, or procuring subscribers, as above stated.

BUSINESS NOTICES.

CURRENT COMMENTS.

Worthy of Imitation.

THE following story is told by the Springfield, Mass., Republican and is well worthy of imitation. We hope it will be imitated until Railway Companies learn that people who pay fares on railways are entitled to certian rights:—Among the passengers who got on the train at Utica, N. Y., were twenty-three men who were unable to find a seat. Among them was a lawyer, who proposed to the rest that all decline to give up their tickets until they were furnished seats. The agreement was made, and when the conductor came around he found twenty-three gentlemanly but very obstinate men who refused to give him either tickets or money unless he would show them a place to sit. The conductor replied that there were plenty of vacant seats in the next car, but on inquiry it was ascertained that this was a drawing-room-car, for which extra charge was made. So the twenty-three declined to budge, and matters remained in this unsettled condition until the cars had gone a long distance. The conductor finally induced two dozen persons who had seats to go into the drawing-room car without extra charge, and then made place for the obstinate twenty-three, who then gave up their tickets, as they had said they would do. Undoubtedly they had the right of it, as the courts have repeatedly decided that a passenger is justified in refusing payment of fare until the railroad company gives him proper accomadations.

Abuse of the Franking Privilege.

WE have evidence going to show that politicians of both political parties are busy and unscrupulous in their violation of law, and that the mails are encumbered with political documents franked by Members of Congress—perhaps often franked by men to whom they have delegated the power to use their names for this purpose contrary to law—which have no public interest and which are just as much a swindle upon the people as it would be if the RURAL NEW-YORKER were to obtain the frank of some M. C. for its own private business purposes. If anything were wanting to show that the perpetuation of this "privilege" is due entirely to the schemes and interests of politicians, who are more than willing the people should pay the expense, the practice during the present political campaign is sufficient. It ought to be made one of the issues in every Congressional District that candidates shall vote for its abolition.

The Ex-Emperor of the French at Brighton.

THERE was a French row (in mild but emphatic form) at the late meeting of the British Association for the Advancement of Science at Brighton, Eng. Ex-Emperor Napoleon was present. He was described in the Association list of members as "His Imperial Majesty, the Emperor of the French." M. de Fonveille, a representative of the present French Government, and a brother of Count de Fonveille, whom Prince Napoleon attempted to shoot when the Victor Noir affair occurred, protested against this designation of the Ex-Emperor as "disregarding the present state of things in France," and withdrawing from participation in the proceedings of the Association. It was modified, and M. de Fonveille staid and participated, while the Ex-Emperor quickly withdrew from public notice and left Brighton.

The French Academy of Sciences and Charles Darwin.

CHARLES DARWIN having applied for admission to the French Academy of Sciences, has been rejected by a large majority. The reasons given for his rejection were solely scientific. M. Moigne said "the Author of The Origin of Species' and 'The Descent of Man,' has too far sacrificed science to renown and reason to imagination, to deserve a place in the first rank of earnest scientists. * * He has fallen too low, especially in his last work, has too much belittled himself not to be made to expiate it. * * In closing itself against Darwin, our Academy of Sciences desired to protest energetically against the abuse which has been made of his doctrines, by such men as Clemence, Royer, Hoeckel and Vogt."

Sweden Depopulating.

THERE is a good deal of apprehension because of the emigration from Sweden of able-bodied men and women—working men, mechanics and domestics. In 1868, 30,000 left the kingdom; in 1869, 38,500 migrated; in 1870, up to August 20th, 20,463 had left the town of Goethborg, alone, for America, and they migrated after that, regularly, at the rate of 100 to 200 per week. The drain has been steady and increasing since. No wonder there should be alarm on the part of those interested in retaining this population at home. Every one of those who settle in this country sends back seeds of discontent, which develop there in increasing emigration. This is, therefore, the Land of Promise. There is need that it be wisely governed, and this influx of population be wisely controlled.

American Missionaries in Egypt.

CONSUL-GENERAL HALE, at Alexandria, was a friend of the American Protestant Missionaries in Egypt and protected them. The disgraced G. H. Butler, his successor, was not—at least he failed to protect his own countrymen engaged in missionary work in their rights, and it is asserted was actually engaged in persecuting them, actually inciting an assault upon one of them. Protests were made to the American Government, and Butler's removal asked for; but this was so long delayed that these missionaries were compelled to take steps to be naturalized as British subjects and seek the protection of the British flag. If this statement is true—and it is made authoritatively—somebody is a disgrace to, and has disgraced the American people.

The Meeting of the Emperors.

BERLIN has been the scene of brilliant festivities; but it is all over. The Emperors of Germany, Russia and Austria have had a formal meeting, discussed European affairs and policies, but have not attempted, nor is it known that they have suggested, a formal alliance. They were aided in this interchange of views by their respective Premiers, and it is asserted that as a consequence of this meeting the peace of Europe is assured. France's representative has received assurance of kindly intentions towards that country. Thiers professes himself satisfied and Prince Bismarck now expresses the wish that the making of history may cease—which means whatever the reader may choose to construct out of such diplomatic utterance.

The "Straight-out" Democrats.

CHARLES O'CONOR and John Quincy Adams were nominated by the Louisville Convention of "Straight-out" Democrats for the Presidency and Vice-Presidency respectively. The former declined, and the latter also declined unless O'Conor would consent. During the past week a Committee of that Convention has been laboring with Mr. O'Conor to induce him to accept. He still declines—but in such a way that the Committee have decided to run him for the Presidency, having faith that he will accept the office if he is elected! His response to the Committee is a curious document, and is the best proof possible that he is an introspective philosopher and not, in any sense, a politician.

Mental Telegraphy.

IT is reported that a scientific Russian has discovered what we have many times heard predicted would be discovered and practiced, a system consisting simply in the exercise of a power to impress upon other peoples' minds, at whatever distance away, the words and ideas which at the moment occupy his own. He is said to claim that he can teach this system, that it will do away altogether with the telegraph, and is absolutely practical. This Russian is only asserting that he has discovered what many intelligent people have been impressed with the belief will sometime be discovered. And there are singular experiences current going to prove its possibility.

The English Ballot Bill.

THIS bill, recently passed by Parliament, gives to the people of Great Britain the ballot they have long struggled for. It is called the "New Magna Charta of the People." It is a surrender of aristocratic power without modern precedent in England. It secures to the English workingman the right to vote without question or surveillance, and hence, independently if he chooses,

IN AUTUMN DAYS.

BY ALIQUA.

WE hear the crickets' ceaseless song
These dreamy days,
While hills afar are dim and blue
In robes of haze,
And Summer waves a last adieu
With saddened face,
While Autumn slowly comes along
In stately grace.

The butterflies with yellow wings
Flit o'er the flowers,
We fancy they but typify
The golden hours:—
The fleecy clouds that sail the sky
In silence pass,
And still the crickets chirp and sing
Low in the grass.

The chirping chimes with our day-dreams;
To saddened hearts
It speaks but of disease that blights,
And death that parts;
To happy hearts whose hope is bright
It sweetly tells
Of pleasant ways where sunshine gleams,
And ring joy-bells.

Among the Autumn blossoms bright
The low wind talks
Of feet that pressed in years agone
These garden walks,
That since beneath the marble stone
Ceased wandering,
And o'er them now through day and night
The crickets sing.

Among the green gleam leaves of red,
A banner bright
That Autumn flings upon the breeze
To state her right,
While with sad sighs amo' g the trees
The soft winds pass,
And crickets mourn for beauty dead
Low in the grass.

Our Story-Teller.

A MODEL ROMANCE.

"Sir," said Dr. Johnson, "let me show you a model."

"OH, Mr. Ormond, I am so tired of this position. I wish you could let me have a rest. Do—there's a good fellow—please."

"Wait just five minutes, Polly, till I've done this bit of your head. Don't move—just one minute more. I'm getting it right now, and then we'll knock off for a bit."

The request was the request of a model; the answer was the answer of a painter. The model reclined, in a half kneeling attitude, apparently at the foot of a cross. Her clasped hands were uplifted; her eyes were upraised pathetically; her long hair streamed down, flowingly, over neck and shoulders; a loose white sort of shirt clothed her to the waist; below was a reddish-

THE WILSON SEWING MACHINE PALACE.—(See Page 202.)

brown skirt, skillfully disposed as "drapery," in artful folds. The whole attitude and expression represented—and represented well—imploring agony combined with tender despair. The bare arms were beautifully posed; the eyes gleamed with a sublime splendor.

The painter, my friend Frank Ormond, A. R. A.—is working with quiet excitement at his easel. His figure is tall; he wears the velvet coat of his craft; he—but why describe him? Everybody knows Frank Ormond. Let that pass.

And now, reader, while painter and model (the attitude was a trying one) have "knocked off" work for a little rest, while he lights a pipe and she, yawningly, stretches her stiff and weary limbs, let us look round us at the delicious litter of a painter's studio.

The house is old, and dates, probably from Queen Anne's days. It has, no doubt, been the habitation of nobles of that period. You cannot see much of the walls, but look at the doors, at the painted ceiling, at the splendid marble mantlepiece. Look at the deep window places and tall, thickly-sashed windows. It is a house which Hogarth might have used for the residence of Lord Squanderfield.

The studio is a large, three-windowed room, cold and bare of aspect. The backs of canvases framed with deal, lie about like bits of scenes out of use, and suggest somewhat the coulisses of a theater. A lay figure, with a wooden fixedness of aspect, its head reminding one of a ship's figurehead, sits in a renaissance chair, and wears a thirteenth-century costume. This figure forms the principal still-life object in the room. In one corner reposes the major part of an old suit of armor, the dull and dinted breastplate surmounted, in a rather drunken way, by a rust-red helmet. A belt-hilted rapier, temp. Elizabeth, which, says Frank, might have belonged to Raleigh, leans against the wall, and near it is a small-sword which suggests the tenenp times of Anne, the flowing wig and stiff skirts, the figure of Addison, or the brawling Mohocks who stopped Swift's chair. From the open door of a richly carved dark *armoire* depends a Japanese robe. Plaster casts of feet and hands, busts, masks and a torso, with the muscles strongly accented by dust, are sprinkled about, and contrast chalkily with the color of hangings, bits of silk dresses, and a remnant of tapestry. Two old foils, one broken, and both grievously damaged, lie across the arms of a magnificent antique chair, which has a seat of crimson velvet, on which rest a Spanish mandolin and one boxing glove; while a strip of yellow Chinese silk has slipped down on the floor. A stuffed monkey, with a perennially diabolical smile upon a swollen visage, balances uneasily upon legs with a padded look about them, while a stuffed owl stares glassily in sullen gravity. The bust of one Roman Emperor is crowned with a Vandyke hat, and a white petticoat is supported by two Velasquez boar-spears. A very handsome oak table, with massive legs, is covered with Venetian glasses and Flemish bottles, with "pots" of various sorts, comprising Gris de Flandres, Satsuma jars, and the blue lange Lizen, or six-mark Japanese ware, while an exquisite little Japanese cabinet is crested by a handful of peacock's feathers. Sketches in charcoal and in oils, copies of world-renowned pictures, studies, unfinished paintings, are strewn about in picturesque and grotesque confusion; and, finally, at one end of the room, with the best light falling full upon it, stands the guillotine-like easel, on which rests *the* picture of the hour, the canvas which absorbs all Frank Ormond's thoughts and is freighted with all his ambition, the picture upon which he is now working.

And so the happy painter works from year to year—labor, completion, weariness, fruition, recommencement. His whole work and hope are concentrated, for the time, upon the picture with which he remains face to face for many lonely months. It is finished at last: finished just when it must be completed, in order to be sent into the Academy; and then the reaction of lassitude, after a long tension, begins. His work has gone out from him; the painter feels weary of the picture over which he has felt so many fluctuations of depression and delight. It has absorbed so much of himself that he cannot judge it truly; he alternates between confidence and despondency; he sighs half with regret, half in relief, as his distracting darling is carried forth from his doors. Then he relaxes the long strain of anxious labor; he amuses himself, and half forgets his art; he works but little, if at all. The picture gets well hung; then comes the private view, with the critics; then the public crowding about the shining rows in the splendid gallery; then follow the favorable notice, the praise of friends, the sneer of "brother" rivals; then all this passes away, until, after due relaxation, the painter recommences with renewed ardor his work so beautiful and loved. A painter, by the way, has one great advantage over an author—he is sure of his spectators, of his public. If his work be hung in a good exhibition, it is sure to be seen by all those whom the painter would wish to see it. An author has to go to his readers; but his spectators always come to a painter.

Meanwhile Frank, twisting his mustache as he gazes on his picture, and now and then throwing in a deft and rapid touch of the brush, is waiting until his model shall have rested in order to go on.

"Bother the skirt!" cries that young person, who, with a view to warming herself, has been dancing about the studio trying a burlesque pas which she had seen on the previous evening at the theatre. "There, Mr. Ormond, I'm rested now. On we go again!"

The little model interested me, both in her individualism and as a member of a class which furnishes to the artist the materialism of the romantic. I tried to learn something of her history, but I succeeded only sketchily, and in a piecemeal manner. Her name was Polly Brown. She was distinctly pretty and piquant. She possessed, among her various merits as a model, very long and beautiful brown hair, which she knew how to dishevel and tumble down far below her waist, in a flow of romantic distress. Her eyes, brown also, were large, and full of soft fire; and the little monkey had a trick of rendering them plaintive and pathetic in expression, so that she was particularly valuable as a model for young heroines in distress, virgin martyrs, betrayed beauties, and the like. Her complexion was that of a light brunette; had she lived more in the country, her cheeks would, it is probable, have shown a little flush of tender red through the pale, soft olive of her *teint*. She had a nice little nose; the mouth was good, though perhaps a little large, but she knew how to purse it up and to draw the corners down so as partially to conceal this little defect. The shape of the little half arch, half tender face was a fine oval, and the head was remarkably well set on. She was good in profile, but better as a three-quarter face with upturned eyes. Her hands and feet were small, and the figure, though a trifle *petite* was round and well shaped. Her manner was always merry, but never boisterous, and the girl had innate tact and taste.

"Yes," observed Frank, critically, "she is a first-rate model, in her line. It is only when you see a good deal of her that you detect the least little trifle of vulgarity, which comes, no doubt, from her mother. Do you know I rather like that little suspicion of plebeianism: it shows that her base touches the people. She is good, you know, for historical heroines. She is, in fact, fit for what actors call the juvenile tragedy line of business. Do you remember my Olivia in the Vicar of Wakefield? Well, she sat, and did splendidly, for that. She's always punctual, and pleasant to deal with; she's lively and frisky, but never rude, and she's really a good little girl. Out of all the models I know, she's about the best. I like little Polly; if you want to please her, you've only got to send her to the play."

The little model had considerable imitative and dramatic talent, and readily picked up the trick of her trade. She quickly caught a painter's idea, and produced the expression, or caught the attitude, which his purpose required. She had a little feminine voice, almost as exquisitely dainty as Marie Wilton's, and had conquered that difficulty, so great to one of her class, of a good pronunciation.

Polly's mother was housekeeper in a set of chambers. She had been on the stage in her youth, and retained a strong passion for the theater. Of her father I could learn nothing. Polly herself, in her early girlhood, had been theatrical. She danced as a fairy in pantomimes, and formed one of a child-group of peasants, or what not, as required by the ballet-master; but, to her great disappointment, she never could obtain a "speaking part." One Winter a severe illness threw her out of her usual employment. When she recovered she found no opening in the theater, and she was, for a short time, driven to resort to sewing. She was then engaged in the extensive and prosperous out-fitting establishment of Messrs. Abednego and Melchisedek; but this miserably-paid drudgery did not long suit Miss Polly. She was unhappy, and grew desperate, or rather determined. Sanguine in her youthful hopefulness, she suddenly discharged herself, and trusted to the chapter of accidents. One day, when very poor, Polly strolled into the Park. Sitting down upon a bench, still and quiet as an Arctic Winter night, she thought and thought what she could do, what she should do, to earn her living. It was early Spring; the painters were hard at work for the Academy, and good models were scarce. Frank Ormond happened to be passing by. He wanted a girl-model, and his painter's eye was struck by little Polly's face and figure. He spoke to her, and proposed that she should come and sit to him. Polly consented, and went the next morning to his studio. She had found a new trade, which she rather liked, and which, as she gradually acquired a connection among painters, paid her moderately well. She grew attached to the free and easy Bohemian ways of the studio, and was soon launched as a well known and popular "model," in which capacity, while sitting for Joan of Arc, I first made her acquaintance. Polly, by the way, always had a superstition about the Park, and believed that it was a place which "brought her good luck." "I first met you, Mr. Ormond, in the park," she used at times to say, "and I am sure that some day some great good fortune will happen to me in that dear old Park. I often sit upon that bench where you first saw me. Ah, I was badly off then!"

The life of a model is not without perils and temptations to a young girl; but Polly trod safely her rather dangerous path with a firm, light step. Her innocence was not ignorance; for she saw and heard a great deal, and understood all that she saw or heard. Without protectors or advisers, lonely but self-reliant, the girl walked along the edge of unfenced precipices circumspectly and shrewdly. She was ardent, and perhaps ambitious, but had a certain integrity of will and quiet force of character which held her upright. Very unconsciously, the little lowly thing was a sort of worldly heroine.

Natural character, and the influences of the circumstances which surrounded and molded it, produced some rather complex contradictions and problems in our model. Seen in some aspects, you would have pronounced her to be a little good-for-nothing; merry and pleasant, indeed, but worthless. Yet you would have judged her wrongly had you based an opinion upon the superficial trivialities which she turned outside. She never made any pretense of goodness; she rather took pains to show her worst side, to appear much worse than she really was. She had naturally a light side to her character, and she emphasized her levity in all that she showed of herself to others. Nor was she, at times, wholly free from passing thrills of temptation; but, like the needle of the compass, which, though it vibrates tremulously, yet ultimately points always rightly, she gravitated back infallibly to good. A creature by no means too bright or good for human nature's daily food, there was in her that "mystic sense of right" which so stirred the enthusiasm of the German philosopher. Exposed to so much danger, sustained by so little help against evil, some unseen power kept this girl always really pure and good. She had, no doubt, a *tendresse* for Frank Ormond, but then her shrewd, practical sense showed her that there was, as she termed it, "no use" in indulging such a feeling; and, taught by the hard lessons of her life, she had learned to repress, to restrain, and to forego.

One morning, when Frank was just finishing his well-known picture of the execution of Lady Jane Gray, in which Polly, of course, "sat" for the victim Queen, the young lady, at the conclusion of the sitting, said, very quietly:

"You won't want me any more, Mr. Ormond. You've finished that picture, head and all, now. I'm glad of it, because I shouldn't be able to come to you again."

"Not come again, Polly—why not? I suppose you are very full of engagements just now; but you mustn't throw me over. I shall want you next for my Dorothea."

"I'm very sorry, Mr. Ormond, but I shan't ever be able to come again."

"Not be able to come again—what the deuce do you mean, Polly?" asked Frank, rather pettishly, as he "relieved" the headsman with a deft touch. "I suppose you're getting too rich?—no, it can't be that. You must come. There's no model at all like you for some of my work. Ah, I see! You've been spooning with some fellow, or in trouble, eh, Miss Poll?"

"No," replied the young lady, with demure dignity, "no trouble, thank you, Mr. Frank. The fact is—I can't come, because—because I'm going to be married."

"Married—whew!" cried the painter, facing round from the easel and taking his pipe out of his mouth. "Married, Polly! I never heard about that—who is it? What sort of a fellow? A good one, I hope, for your sake."

"Never mind, Mr. Frank," responded Miss Polly, composedly. "Perhaps you'll know some day, but not now. Thank you for all your kindness, Mr. Ormond. You've always been very kind to me, and I—I like you very much. Yes; I'm doing very well, thank you. He is a good fellow—I like him, and I mean that we shall be very happy. But when I am married I can't ever sit again any more, if you please."

Frank Ormond growled discontentedly. He did not like losing his model, and he felt a vague jealousy of the unknown. There was a sneer in his tone as he said:

"I suppose, Polly, you have caught some old fool, who is taken with a pretty face, and your union will be about as incongruous as a woodbine twining round a wooden leg."

"Think what you like, Mr. Ormond," said little Polly, calmly. "I know what you do think; but never mind that. I shall tell you just nothing about it. I only come to-day" (Polly was tying on her bonnet) "because I knew you wanted me to finish your Lady Jane Grey. That's done now, and I must say good-by. I'm very grateful to you, Frank, I am, indeed, for all your kindness. I'm sorry to have to give up coming to the studio—I liked the life—but it's all over now. Thank you—six shillings; yes, that's right. My career as a model is ended. Once more—good-by, Mr. Frank!"

She shook hands cheerily, and then shut the studio door for the last time.

The strange thing was, that the little witch really had made a good marriage. She had won the affections of a good man, of position and property. The reticent little monkey never, I believe, told any one of her courtship, or the progress of it; but once, some time after, she betrayed herself so far as smilingly to tell Frank, when she met him in society, that the whole thing began "In the Park, in that dear old Park; on the old bench, you know;" and this was the alpha and omega of her confession. Many studios were for a time corroded by curiosity; but time had to wear this feeling away without other artificial solacement. Some painters expressed anger at losing their little model; others expressed perplexity at her rise in life; but no one could drop a hint against her fair fame, and, as she had been generally liked, many good wishes accompanied her change of position.

Like that Mattie, sometimes a 'near cousin o' the Laird of Limmerfield's," and who, when elevated to the position of Mrs. Bailie Nicol Jarvie, behaved excellently in her exaltation, little Polly made a model wife. She had all a woman's pliability, adaptability and tact; and she soon picked up the style and manners necessary to her new position. She was naturally grateful, and she had a little touch of woman's pride; pride in herself, and pride for her husband. She wished to make her husband happy, and was determined that he should not have to blush for his choice. She set to work, too, to educate herself in her way. Having a strong motive to impel her, and great natural quickness, she soon succeeded in acquiring a respectable veneer of culture; and Frank Ormond who meets her from time to time, told me that she had developed and improved in an altogether surprising manner. I believe that she succeeded, without apparent effort, in eduing from Mr. Frank the respect due to her new position, rather than the familiarity likely to arise from their old relations, and yet she was quite frank, and kind, and natural, with him.

"By Jove!" cried Frank, "when I took her down to dinner the other day at the Howards', I could hardly believe the self-possessed, lady-like woman by whom I was sitting had ever been the little monkey that used so often to dance burlesque dances about my studio! But woman are wonderful creatures, sir. Their knowledge of the world beats ours. If they were only as good actresses on the stage as they are off it, the dramatic art would be in a fine way."

Success ripens and improves some natures; and little Polly was decidedly improved by good fortune. She was always pretty, but as I saw her the other day in the Park, (looking out probably not without thoughts for a certain bench,) reclining easily in her carriage, she appeared positively elegant and *distingue*. She was particularly well-dressed, and had a piquant touch of *grande dame* in her manner.

Does any one who has ever really belonged to Bohemia pass out of it into Philistia, or even into higher regions, without an occasional retrospect of regret, and a backward glance, coupled with a sigh?

Did our Polly, lolling upon her easy carriage cushion, ever look back with a tinge of sadness to the days in which she used to trudge on foot, through mud and rain, to the stage door, or to the painter's studio? What does she think when she visits the Royal Academy? How does she feel when she goes to the theater? Does she ever speculate upon the new model (the golden-haired one) who now sits to Frank Ormond? Does she, as she gazes upon the "Amaranthine Bowers of Boundless Joy," recall the feelings of the *figurantes* who, clothed in sheeny tinsel, float etherically upon iron supports in the ideal atmosphere of blue and red lights? I do not know; I have no hint which would enable me to solve the problem; but I am assured that she is gratefully happy in her married life; and that as a wife, she is still a *model*.

Sabbath Reading.

LINKS WITH HEAVEN.

OUR GOD in Heaven, from that holy place,
To each of us an angel guide has given;
But mothers of dead children have more grace,
For they give angels to their GOD and Heaven.

How can a mother's heart feel cold or dreary,
Knowing her dearer self safe, happy, warm?
How can she feel her road too dark or dreary,
Who knows her treasure sheltered from the storm?

How can she sin? Our hearts may be unheeding,
Our GOD forget, our holy Saints defied;
But can a mother hear her dead child pleading,
And thrust those angel hands aside?

Those little hands stretched down to draw her e'en
Nearer to GOD by mother love:—We all
Are blind and weak, yet surely she can never,
With such a stake in Heaven, fail or fall.

She knows that when the mighty angels raise
Chorus in Heaven, one little silver tone
Is hers forever, that one little praise,
One little happy voice, is all her own.

We may not see her sacred crown of honor,
But all the angels flitting to and fro
Pause smiling as they pass,—They look upon her
As mother of an angel whom they know.

One whom they left nestled at MARY'S feet,—
The children's place in Heaven,—who softly sings
A little chant to please them, slow and sweet,
Or, smiling, strokes their little folded wings;

Or give them Her white lilies or Her beads
To play with:—yet, in spite of flower or song,
They often lift a wistful look that pleads
And asks Her why their mother stays so long.

Then our dear Queen makes answer—she will call
Her boy soon: meanwhile they are beguiled
To wait and listen while She tells them all
A story of Her JESUS as a child.

Ah, Saints in Heaven may pray with earnest will
And pity for their weak and erring brothers:
Yet there is prayer in Heaven more tender still,—
The little children pleading for their mothers.

***

SELFISHNESS vs. CHARITY.

THE two spirits, Selfishness and Charity, are strangely associated in life. Side by side they walk in contrast. One ever disseminating, the other ever absorbing. One demanding of others, the other granting of itself. Selfishness claims the world owes him a living; Charity believes he owes a life to the world. The one is jealous of his good name, desiring a reputation he does not deserve, while the other, meriting applause, shuns the praise of an unstable public. The one is resentful of rent or supposed injuries while the other "suffereth long and is kind." Selfishness claims services and gifts and deference, and when denied moans, "*Why* am I defrauded of my due?" Charity is full of thankfulness for blessings possessed, claiming but one thing—that its gifts may not be despised, that they may be appreciated and be fruitful of much good. Human nature desires returns for investments; this is a motive power—Charity is human, therefore he desires to see his efforts productive; he desires also to see others using their latent powers. These desires he does not always obtain, for Selfishness, languishing in miserable discontent, is ever demanding Charity. Selfishness has a thousand excuses from service, and so shirks his responsibilities upon Charity. He claims to be too tired, or too weak, or too incapable, or too hurried, or too refined, or too burdened to perform disagreeable duties. So Selfishness is often the "hen with one chick," and Charity, with a dozen chicks, must care for some other one's brood.

Thus it goes, burdens are unequally borne. The generous become the victims of imposition; but they should not, therefore, fail in courage, but ever remember that they are richer in their loss than the selfish in their gain.

But who are the selfish? Is there one in the world who is selfish—in his own eyes? If we may not

"See ourse'l's as ithers see us,"

we may know the selfish about us by their fruits. No man who sits with his fourth newspaper, and sees a slender woman—even a servant—carry a burden so heavy that it nearly doubles her sideways, can be unselfish.

No able woman, who habitually allows a wearied husband, or father, or brother, to return to an untidy home, and a late, unpalatable meal, can be unselfish. No one who receives a well-meant kindness unthankfully can be unselfish. No one who is careless of the discomfort of others, who never dresses well, nor arranges a room, nor beautifies the grounds surrounding the house, nor does one or more of the thousand nameless little acts that gratify the tastes, or refresh and gladden the hearts, of others—no one who scorns these things can be quite unselfish.

He who has never a smile nor a tear, nor an impulse of kindness toward others, is unfit to live.

WHEN we are in trouble, whatever that trouble may have arisen from—whether from sin, or from conscience, or from affection, or from remorse, or from bereavement—the command is, *Look to Jesus the author and finisher of your faith*—not to Jehovah.

CHRIST is watching from heaven, those in whom his heart is, and in whom his blood is. He is watching paternally, and not merely as a spectator would watch in the excitement of a contest.

Ladies' Port-Folio.

THEY TWO.

BY HESTER A. BENEDICT.

THE vesper bells were ringing sweet
In the sultry Summer weather,
When THEY climbed the mount with tired feet,
To kneel and to pray togther:
To kneel and to pray where the tender skies
Bent low to the pine trees' sighing;
With only heaven to hear their cries,
And heaven to make replying.

"Our hearts, O Father! are one," they said,
"But we go two ways to-morrow:
And life will linger, and lovers will wed,
And what can we beg or borrow
Of earth or heaven to bridge the years—
Drearier than drearest night is—
Lying between the Valley of Tears
And the city where Thy delight is?"

Over their cold, cross'd palms a light
Struck sharp through a coal-black shadow;
And silences not of the day nor night,
And sweets nor of moor nor meadow,
Folded them fast, while a voice sung clear
From the soul of the silvery arches:
"They are true soldiers who feel no fear;
GOD knoweth how hard the march is!"

Only a dimming of patient eyes,
A smiling of lips that quiver,
And blue behind them the mountain lies—
Blue before them,—the river.
Burdens for both of them—battles for each,
And the wild and the wearying weather;
But—further away—a Paradise beach
And two ways winding together.

WHAT SHALL THE GIRLS DO?

IN the Public School Reports of the city of New York, *girls rank on an average 100 per cent. higher than the boys!* The nearest equality gained, was in Arithmetic, in which study the girls excel the boys 50 *per cent!*

One of the leading "male" teachers says he "doesn't understand it." He says he knows it to be so, for he has taught both boys and girls, and the latter have always excelled. "There is something strange about it," he avers with a shake of his head. Instead of coming straight to the point and acknowledging girls to be smarter, quicker and brighter than boys, which of course is the only reason for their superior success, he attempts to "beat about the bush," and enshroud the reason in mystery.

But accepting the fact as fact, I asked him one day why it was that, beyond a certain point, young men so outstrip their sisters in the real study and work of life?

"Because," said he, "girls, after they get to be twenty years old, think the further business of their lives is to fall in love and get married, and that in married life a woman has no earthly use for educational attainments. While men regard marriage rather as an aid and a part of their career, instead of an upright stone wall to prevent further progress."

How very sadly true I thought. Innovation upon any custom is heralded by an earthquake, and everybody feels the shock. The more quiet, retired, and furthest removed from centers of thought a man or woman is, the more sensitive he or she is to the shock. They quake in absolute terror, not having philosophy enough to accept as the inevitable and natural result of revolutionary tendencies, these social upheavals of the nineteenth century. The very air we breathe is charged with the revolutionary spirit of the times. Since 1861, when old forms began to give way with such fearful sounds, the destruction of old ideas and customs has been continuous and rapid.

But how does all this concern or affect women? Are not our girls of to-day to be the same women twenty years hence that their grandmothers were twenty years ago? Are the heart and the nature of woman to be changed in the wondrous speed of this new civilization? No; but her quick brain, her cultivated, keen perceptions, are to be utilized and brought into action. The necessities of the age require and demand it. Motherhood and wifehood are not in the future, as in the past, to swallow up the "Coming Woman," any more than fatherhood or husbandhood does the present man. I am advocating no doctrine, only calling attention to one of the social phases now undergoing the transition that will soon develop it into a *fact*.

It is both wise and well for women to observe closely and keenly "the signs of the times." There is never any use in being wilfully blind to what must inevitably be. No unprejudiced person believes that women with the brains and genius of GEORGE SAND, of Mrs. BROWNING, of Mrs. STOWE, or MARIA MITCHELL, would have served GOD and humanity better by spending their time and strength in nursing babies that some ignorant, muscular, but kind-hearted, serving woman could do equally as well, and generally much better, or expending the entire energies of their moral and intellectual natures in "keeping house" for some one man.

Hundreds of young women who read this will exclaim:—"Well, for my part, if I succeed in keeping house for some one man as it ought to be kept, I shall have all I want."

That may be, but by what *right* do you thus consecrate yourself? JESUS gave MARTHA to understand that there were other missions for woman aside from housekeeping. When I read that girls rank 100 per cent. above boys in average school brain-work, I cannot but wonder at the amazing stupidity of mankind in having failed to realize the inestimable loss to the world in the way in which women's brains have been utilized. Thousands of women to-day are abominable housekeepers, who would have shone resplendent in other work. I would detract from the usefulness and honor of no employment, for nothing can be done without the help of a certain kind and degree of intelligence. But I do protest against the obstinate intellectual waste of brain and talent that has so characterized the past—a waste that inevitably results from mis-appliance. A pair of boots on a house-top serves nobody. The thousands of bright girls in school, in college, in kitchen and parlor, who possess the power to serve and bless the world, how shall they best do it? It is a question for parents and guardians, and especially for themselves, to think about. The present and the future demand more than the past received. How shall this demand be met?

MARY E. WAGER.

ABOUT WOMEN.

BY LETTIE A. IRONS.

"THE woman question!" There are so many sides to it, one has difficulty in finding an edge to get hold of. But the *most disagreeable* side of it is the question of sex. "Shall woman unsex herself?" This is a hydra-headed monster that troubles the men. It renders their days hideous and their nights sleepless.

"Unsex herself!" Dear me, if there ever was a hackneyed phrase this is it. And what is worse, I don't know what it means. No doubt it will set the seal on my stupidity to say so, but it is a fact, nevertheless. One cries out against their voting because it will "unsex" them. Another against women being editors, or clerks, or doctors, for the same reason. Neither must they be inventors, nor take an interest in agriculture, nor know how to harness a horse or drive one. Because if they *should* do any of these horrible things they would be "unsexed." Awful fate!

What mysterious change this is, the fierce defenders of the sex of women do not very clearly demonstrate. At least not to *my* satisfaction. I have, myself, committed the unpardonable sin. "For I remember how in those old days" I knew how to, and actually did, harness a horse, hitch him to a wagon and drive about, perfectly independent of anything masculine; and this offense was repeated, not once but many times.

I also have a vague recollection of "mowing" away some hay on one occasion, and of grafting some plum trees, on another. And I am firm in the conviction that, notwithstanding these awful experiences of mine, the most Argus eyed person would be unable to detect from my manner that I had so dreadfully stepped out of my "sphere."

This eternal harping on sex is the curse of so many helpless women. They absolutely *dare* not do anything to support themselves lest they should unsex themselves. And instead of adopting any pursuit their taste may lead them to, they sit down with folded hands, depending on "Pa" or brother JACK for "pin money," to wait for *a man*, this being the proper and womanly thing to do.

How many girls I have knowledge of that do their work merely as a thing of the present, to be dropped any minute that the "coming man" shall make his appearance! I solemnly believe that more than one-half of the women think that marriage is the most important and most desirable thing in life. It is a shame and disgrace to women to be so helpless and "viney." In the year of grace 1872, they ought to be something besides mere pensioners on the bounty of a man.

The first thing I shall vote for when women are recognized as people by this "great and mighty nation," will be a law placing the marriageable ages of the sexes at twenty years for women, and twenty-four for men. In view of this interminable period of loneliness and single misery, a great number will commit suicide, leaving the more sensible ones to attain an age sufficiently advanced to widen their vision so as to enable them to see some object in life besides a man.

Marriage should never be on a woman's list of things to be attained. It will come "accidentally" when the proper time comes. Looked forward to, as a necessary and inevitable thing, it becomes too much an object to shut out everything else.

Carve out a way for yourselves, girls. Don't be so afraid of "unsexing" yourselves that you won't dare to strike out in a new path, but work for yourselves, and *be yourselves*, strong and independent, and not the yielding, clinging shadow of something masculine.

FEMININE FELICITIES.

AN old, ragged, red-faced, forlorn looking woman, accosted us with, "Plaise sur, for the luv of Heaven, give me a tip to buy bread with. I am a poor, lone woman, and have young twins to support." "Why, my good woman," we replied, "you seem too old to have twins of your own." "They are not mine, sur, I am only raisen' 'em." "How old are your twins?" "One of them is seven weeks ould, and t'other is eight months."

RICH MAIDEN LADY:—"Well, May, why are you looking so hard at me?" May:—"I'm looking for your other face." Lady:—"What other face, child?" May:—"Why ma is always saying you have two faces!" (Consternation of mamma.)

Reading for the Young.

THE FOX AND THE GOAT.

FROM THE FRENCH OF LAFONTAINE.

A GOAT, above whose head great horns uprose,
And who could not see an inch beyond his nose,
Once, when traveling, chanced to meet
Sly Major Fox, the master of deceit.

The heat had made them tired and dry;
So, when a deep walled well the road passed by,
They made all haste to reach the pool,
And quench their thirst with water cool.

"We must get out; it is not all to drink,"
Said Reynard. "I can manage it, I think;
If you will put your feet high 'gainst the wall,
And also your great horns, so stout and tall,

"The hair upon your chin I first will seize,
Then, by aid of this oak bucket and your horns, with ease
I'll reach the top; when there, I have no doubt
But that I soon can hoist you out."

"Ah! by my beard!" the goat admiring said,
"You must have endless wisdom in your head.
I never could invent so fine a way;
Pray climb upon my back without delay."

The fox climbed out the well; then slyly said,
When he a sermon to the goat had read
About the need of patience: "If, in your head there'd been
As much of sense as there's hair on your chin,

"Down in this well you'd not have gone,
Where only fishes and the bucket rightfully belong.
Try hard; perhaps you'll find a way
By which to reach the top, without delay.

"Good-by! I hope you'll find some stairs.
My business and my family cares
Need my attention right away;
So I'll not make a longer stay."

Oh, goats! it would be well to think,
Before you lose your freedom for a drink;
And if among the foxes you find friends,
Remember how this fable ends. E. C. P.

OUR LETTERS FROM BOYS AND GIRLS.

About Oil Wells.

WE live near the Alleghany River where 'tis very hilly, almost mountains, yet the scenery is very beautiful. And we are in the oil country you have no doubt heard of, and I am going to tell you about the oil wells. First, they build a very high, square frame, sixty and seventy feet high, much smaller at the top, and supported by cross pieces; they call it a derrick, and it is used first for drilling a well, and then for pumping the oil. Then they get their boiler and engine, and drill by steam power. They drill ten and twelve hundred feet before they get oil. Sometimes, when they first strike oil, it will flow out and up over the derrick and on to the engine and take fire, and burn it all down, so they have to build anew; then they draw their drilling tools, and put in tools for pumping; they sometimes pump over a hundred barrels a day, but 'tis a very good well; they are mostly from twenty to fifty barrel wells.

They build large, round vats that will hold two and three hundred barrels for the oil, and when one is full they run it to the river in pipes, where it is taken to the refineries. Perhaps Cousin JOHNNIE, or the Wisconsin, Iowa, and Minnesota girls and boys read the RURAL, evenings, by the lights from the oil taken from the wells near here. There are between three and four hundred wells around here, and any direction I look, I can see the derricks extending into the air. There is a great amount of money made, and a great deal lost, for sometimes they will be to the expense of putting down a well and get no oil.—HALLIE.

A Troublesome Lamb.

DEAR EDITOR:—My mother takes your valuable paper, but she is not the only one that reads it, for I am very fond of looking at the pictures and reading the boys' and girls' letters. I thought I should like to tell some of your RURAL boys about one of my pets. When I was seven years old one of our neighbors gave me a little lamb that its mother would not own. I thought a great deal of it; I made it a little pen and a bed for it. I fed it nice warm milk; when it was very small I used to wind a strip of cloth around a goosequill and put it in the dish for it to suck the milk through. It soon learned to follow me all about the farm. One day it followed me to the sugar bush and stayed until I came to the house. I kept it till I got three fleeces of wool from it, and one lamb. I sold the lamb when it was four months old for two dollars and a-half. One fleece weighed seven and a-half pounds after washing. But she got so troublesome about jumping out of the pasture and coming to the door that I sold her for four and a-half dollars. I have a big brother that reads your paper over and over and says it is worth its weight in gold.—RALPH M., *Chautauqua Co., N. Y.*

A Little Girl Who Has Fun.

HAVE you room in your paper for a letter from a little girl eight years old? My father lives on a farm and I have lots of pets. We have three of the cunningest little pups. They stay in the barn in the hay. They can bark like everything. We have five little calves, and my father brought in a little lamb that couldn't stand and my little sisters and I were going to pet it; but the poor little thing died. We have such fun with our turkeys. We call one of them Rufus, and one Nancy, and the other one Baby. Baby is nice, and made a nest and laid 12 eggs and then went to hatching; but Nancy is so provoking. We knew she had a nest, but we could not find it; and when she would see us following her she would come right back to the house and not go to her nest. But we found it at last and there were eleven eggs in it. Then she made another, and we found it with three eggs in it; and now she has another, and we will have to hunt it. I have four little sisters and a big lawyer brother who writes my father great long letters about murders and such things.—MILLIE, *Lowell, Ohio.*

"An Opinion As Is An Opinion."

I LIVE in Brocton near Lake Erie. I think it is very pleasant in Summer to sit and look at the boats as they pass by. I am a little girl eleven years old, but have not got any big brother or sister to fix up my letter as "Cousin JOHNNIE" said. One evening I went visiting with my parents and heard a couple of men talking about the RURAL. One said he thought it was not so good as it used to be; it is too much filled up with children's compositions. But a smarter man said it was him who had changed. I guess that editors are liked better when they pay a little attention to the children, for what do we care about the Dairy Husbandry, Hygienic Notes, Sheep Husbandry, the Herdsman etc., etc.; though we do care to have our mothers know how to make good pies, puddings, soup and all of those nice things which we find in the RURAL. —E. H. S.

Letter from Wild Rose.

AFTER an absence of most three months, a friend pointed out to me HARRY'S request. Thanks for his well wishes. My Indian name is "ANCONOLLA," signifying Wild Rose, the flower for which I was named. Now, HARRY, I claim the beads, for there is nothing I like better than beads in Winter, when it is too cold for me to be out. Bead work is my favorite employment. I wear bead moccasins, and so does my mother. I had a pleasant and happy vacation with a great many of our friends. Our hunters killed a great many deer and turkeys, and I found plenty of wild honey. I had splendid sport practicing with my bow and arrow. I killed rabbits, birds, and squirrels. Some time I will tell the boys how my brothers trap the wolf.—WILD ROSE.

ANAGRAM NO. 4.—

"He practised every pass and ward,
To thrust, to strike, to feint, to guard;
While less expert, though stronger far,
The Gael maintained unequal war."

News of the Week.

CURRENT TOPICS.

Signor Mario and Carlotta Patti,

HAVE, under the managership of Strakosh, again visited this country, and given two concerts in New York City. Mario is an old man, retaining and exhibiting occasionally in his singing, some of his former power and sweetness of vocalization and appreciation of what he sings. Carlotta Patti retains the beauty of face, bird-like clearness of voice, power of vocalization of former years. That anything has been added to her powers we do not see. Miss Carey, who is one of the troupe, has a rich voice full of expression and feeling. The most noteworthy member of the troupe is M. Saurel, violinist. His performance equaled anything we ever heard from Ole Bull or any other violinist. Compared with Ole Bull he lacks an expressive face, and fails to exhibit the facial sympathy with his music peculiar to Ole Bull. But he is young yet.

The "Great Father" and the Indians.

THERE is a great amount of nonsense talked in these interviews with the Indians. The "Great Father" humbug had better be dropped. Secretary Delano has informed some of the Indian Chiefs visiting Washington that the "Great Father" was getting sick of his peace policy, and thought of treating the Indians as he does white murderers, robbers, thieves and other criminals. Let's be done with this "Great Father"-annuity-business. Hang or shoot men who murder and refuse to obey the laws. Treat the Indians just as white men are treated—no better, no worse. Execute the law. That is what President Grant should do; and if in doing it he finds it necessary to hang a few Indian Agents he will probably be doing the Indians and the tax-payers a great service, at the same time meting out justice.

Death of Hon. Garrett Davis.

HON. GARRETT DAVIS, U. S. Senator from Kentucky, died at Paris, Ky., Sept. 22, of an affection of the lungs. He was born Sept. 10, 1801, being 71 years old. He was admitted to the bar of Kentucky in 1823; became an active Whig; was elected to the State Legislature in 1833; was twice re-elected; was a member of the State Constitutional Convention in 1839; was elected to Congress the same year, where he represented his district until 1847; was elected to the United States Senate in 1861, succeeding, in that position, John C. Breckenridge; was re-elected in 1867, holding the position at the time of his death. He was passionate, enthusiastic, of keen susceptibility, and given to keen sarcasm and severe invective on occasion. His successor has been elected in the person of Hon. Thomas McCreary.

Trouble Between Germany and France.

COUNT VON ARNIM, the German Ambassador at Paris has resigned his position in consequence of the unpleasant manner in which he is received in French society. The Germans have, therefore, not only conquered the armies of France, but the politeness of the French. Armed foes do not in all cases cease to hate when the sword is sheathed. The attitude of Germany toward the Catholics, the fact that the Pope has refused to receive as German Ambassador Cardinal Hohenlohe, the resignation of Count Von Arnim, the arrest of Edmund About by the Germans, all tend to unsettle the confidence in the future peace of the two countries which all nations had hoped was secure.

Postal Telegraph.

IT is telegraphed from Washington that the Postmaster-General will devote a large portion of his forthcoming report to the subject of postal telegraphs, and will urge their adoption by Congress, he now having tabular statements and statistics to show that postal telegraphy has met with financial success in the countries where it has been adopted—especially in England, where it is largely used. We see no good reason why the Post-Office Department should not provide cheap telegraphic means of communication as well as mail facilities. Either the carrying of letters and papers should be left to private enterprise and competition, as the telegraph business is, or not. If one is to be in the hands of the Government, both should be.

The Jesuits in Germany.

THE enforcement of the German decree expelling the Jesuits from Germany has begun. Their churches are being closed, priests have been arrested at the confessional in the discharge of their religious duties, schools have been broken up, and the Order of the Company of Jesus, orders akin to it, and congregations of a similar character, are leaving the Fatherland. There are said to be fourteen millions of Catholics in the German Empire, and it is believed that this vast army of religionists will not submit quietly to this edict of Prince Bismarck and his Imperial backer.

Death of the King of Sweeden.

CHARLES XV., Louis Eugene, King of Sweden and Norway died at Malmo, Sept. 18. He was born May 3, 1826. He succeeded to the throne of the two countries on the death of his father, Oscar I., July 8, 1859. His reign has been one of reorganization socially and politically, and he has been regarded as a liberal and progressive ruler. He was married June 19, 1850, to Princess Louise of Orange, by whom he has one daughter but no sons. The throne therefore devolves upon his younger brother, Prince Oscar Frederick, Duke of Ostrogotha, who will acquire the title of Oscar II.

The Nathan Murderer.

WILLIAM FORRESTER has been arrested and arraigned as the Nathan murderer. At the examination, Sept. 18, Ann Keenan, Ft. Lee, N. Y., a music teacher, swore that on the night of the Nathan murder she saw this man whom she identifies, enter the basement of the Nathan house, having some instrument in his hand and concealed by the sleeve of his coat. She was alarmed at the look in his eyes and at the fact that he seemed armed with some weapon in his hand. This testimony is the most direct yet given toward establishing the identity of the Nathan murderer.

The Geneva Arbitration.

THE Geneva Arbitrators have awarded the United States $15,500,000 in gold, to be paid within a twelvemonth, as damages in the case of the Alabama and other similar claims. The British member of the Board of Arbitration refuses to sign this award, and "protests;" of course all England "protests," too. The English press is especially bitter, denouncing the humiliation to which John Bull is subjected in consequence of this award. But what is Great Britain going to do about it?

Inviolability of Private Property.

DURING the recent meeting of the Emperors, the inviolability of private property at sea during war was discussed by Prince Gortschakoff, Count Andrassy and Prince Bismarck, the Premiers of the respective Emperors. This principle seems to meet with the approval of the United States, Austria, Germany, Russia, Italy and Holland. If it is adopted as an international policy by the majority of nations, it will tend to decrease the commercial terrors of war; but it will hardly render wars less liable to occur.

German Emigration to the United States.

TWO circulars have already been issued by the Imperial Government of Germany against emigration from that happy land of beer and pretzels. The last one declares that emigrants will be treated as outlaws, over whom surveillance and supervision has been instituted. But what care Herr, Frau and Fraulein, so that they can once gain the security of the "land of the brave and the free?" They keep coming and are welcome, God bless 'em! There is room and work enough for all!

Spanish Reform in Cuba.

KING AMADEUS of Spain, in his opening speech to the Spanish Cortes, proposes to carry out his plans (what are they?) for reform in Cuba when the war is over—which, according to Cuban patriots, will be when their independence is recognized and acknowledged, or when they are themselves extinct and unable to struggle further. Small hope for the "reform" ticket in Cuba!

The Carlists Promise Insurrection.

DON CARLOS, the recent leader of the Spanish insurrection, has written a letter to the Pope, which is said to be circulating in Paris, which promises a speedy renewal of insurrection against King Amadeus. Is the Pope inciting the internal troubles in Spain as a means of revenge upon the King of Italy? If so, is this the way to propagate Christianity?

An Honest Man.

To find an honest man—one who cannot be bought—is so rare, especially among horse jockeys, that a sporting paper names one who, at Utica, N. Y., was offered $1,500 by a gang of gamblers to sell the race; but he didn't. This is so rare an occurrence that we pass the "Jockey's" name along—ALFRED BROWN of Ontario, Canada.

SEMI-BUSINESS PARAGRAPHS.

Have You Seen It?—Have you seen the most wonderful Sewing Machine of the age? The great Wilson Underfeed, the machine which received *Fourteen Premiums* at the late Ohio State Fair at Mansfield, notwithstanding the many sewing machines competing against it. This elegant sewing machine is on exhibition at the N. O. Fair, and attracts universal admiration for its superior finish and style, beautiful work, easy and quiet manner in which it stitches, braids, &c. Unfortunately there are no premiums offered this year at the N. O. Fair, consequently the Wilson cannot show its superiority over *all other* machines in carrying off all the premiums, as it *has done before*. No machine ever exhibited has met with such success in *receiving premiums* as the Wilson. It is the best Sewing Machine in the world, and the *Sweeping Victories* it has gained, the large sales that are daily made, and the increasing demand for it, are the best proofs that it has no equal. The magnificent salesrooms of this company, corner of Superior and Bond streets, will be brilliantly illuminated every evening this week, to give every one an opportunity to examine the Wilson, and see the Palace of Sewing Machines.—*Cleveland Daily Herald, Sept.* 13, 1872. The salesroom in this city is at 707 Broadway.

Watch No. 12003, Stem Winder—bearing Trade Mark "United States Watch Co., Marion, N. J."—manufactured by the United States Watch Co. (Giles, Wales & Co.), has been carried by me two months; its total variation from mean time being six seconds in the entire time. —W. S. DUNN, of H. B. Claflin & Co., New York.

Facts for the Ladies.—Helen Launceford, Lowell, Mass., reads by the hour while she is doing ordinary sewing with her Wheeler & Wilson Lock-Stitch Machine, and recommends it for simplicity, durability, rapidity and beauty of work. See the new Improvements and Woods' Lock-Stitch Ripper.

Advice.—Send for free Price List. JONES SCALE WORKS, Binghamton, N. Y.

THE MARKETS.

MONEY AND TRADE AFFAIRS.

NEW YORK, Monday, Sept. 23, 1872.

THERE was much excitement in Wall St. through the past week on account of several "cornering" operations in Gold and Money, which threatened for a day or two to run into a wide spread panic. But before the close of the week, after fluctuations of 1½c. in Gold, and 2@2½ per cent in many of the speculative Stocks, the markets resumed steadiness, and prices left off about the same as the Saturday before.

A bold and desperate clique of speculators, known as the old Erie "crowd," (Jay Gould and confederates) who were "short" of Stocks and "long" of Gold, attempted, and successfully to a certain measure, to "corner" the Money market by locking up Greenbacks, the basis of Banking, through the purchase of Gold and the use of their own Bank balances, and from 5 per cent. per annum, the Money market was run on the Stock Brokers to ⅜@½ per cent a day. At the same time they locked up their Gold, or borrowed on it not to be used, and run up the price from 113¾ to 115½ per cent., charging ⅛@¼ per cent. a day for its use when the Brokers preferred to borrow in place of buying. One or two of the Banks attempted to resist the exceptional drafts made upon them at their counters for Greenbacks, in place of passing the Checks in the regular way through the Clearing House, but the Associated Banks in the Clearing House declined to adopt this course as a rule, and the affair was settled. The Banks for the future, however, will mostly adopt the plan of certifying Checks as for settlement through the Clearing House.

The Treasury relieved the money market by purchasing $3,000,000 U. S. 5-20s for the sinking fund on Wednesday last, and sold only the usual $1,000,000 Gold on Thursday which the clique bought at 114 per cent. The price of gold was subsequently run up to 115½ and soon returned to 113¾ per cent.

During these operations in Gold and Money, another great speculator, Mr. Daniel Drew, ran up the price of Erie Stock, of which the Jay Gould people were heavily short, from 47¾ to 55 per cent., and to use the slang of the Prize Ring, the latter were severely "punished" by Drew as they had essayed to "punish" the street on Gold and Money.

The flurry in Wall Street, it was apprehended at one time, would seriously affect general trade, and did reduce the rates of Exchange inside against Produce shipments nearly 2 per cent. It was checked in time to avert more extensive mischief, and the business of the week in Imports and Exports, and also in Domestic Dry Goods, was about the September average. Money returned to 7@10 per cent. on mercantile paper. The Cotton trade is feeling the effect of large receipts from the new crop, and prices have gone down this month about 2 cts. the pound. The new crop is now estimated at 3,600,000 bales. The last crop was 2,934,000 bales.

The following are the comparative movements of the City Banks for the past fortnight:

	Sept. 14.	Sep. 21.
Capital	$87,315,700	$87,315,700
Loans	281,650,300	280,815,300
Gold and Greenbacks	60,892,801	56,896,500
Circulation	27,626,400	27,668,100

PRODUCE AND PROVISIONS.

NEW YORK, Monday, Sept. 23, 1872.

Receipts.—The receipts of the principal kinds of produce since our last are as follows:

Corn, bush	1,330,000	Meal, bbls	2,478
Oats, "	295,000	Flour, "	63,080
Wheat, "	574,000	Eggs, "	5,000
Rye, "	2,000	Cotton, bales	13,500
Barley, "	19,500	Hops, "	1,779
Malt, "	16,000	Wool "	2,000
Seed, "	1,300	Butter, pkgs	14,500
Beans, "	3,400	Cheese "	32,598
Meal, bags	650	Lard, "	1,470
Peanuts bu	2,900	Dried fruits, pkgs	2,760
Pork, bbls	800	Cut Meats "	1,128

Beans and Peas.—There has been a fair supply of new mediums the past week and holders have been compelled to put prices down 37c. per bush., with a very light sale even at the decline. Marrowfats have been in light demand and steadily held with scarcely any of the new received. Green peas meet with a light demand at steady prices. Canada are more in the buyer's favor:

We quote Mediums, prime $2.70@2.75 per bushel; good do., $2.40@2.60; fair do., $2.00@2.25; prime marrowfats, $2.70@2.75; good do., $2.40@2.50; common and fair do., $2@2.25.

Beeswax—Is offered freely at late figures, with very little demand. Sales at 34@34½c. for Western, and 35@36c. for Southern.

Broom Corn—Moderate sales are reported at 3@5c. for red; 5@6c. for green; and 7@8c. for hurl.

Butter.—The market is still supported by the demand for fine grades of butter and prices are unchanged. Trade is not active. Sellers, especially on the West side, are troubled with an uneven run in qualities. Very many dairies and lots that were started previous to the recent hot spell were caught on the way and were more or less damaged. When State butter samples cut soft the buyer is apt to be suspicious and regardless of the dairy's mark; there is always a slow sale for it. With Western the case is different, as the seller has distance to urge in speaking of condition, and as the price is generally in buyer's favor it is easier to work it off. Besides we have about turned from Western to State, and the difference in price makes the market buyer very cautious, expecting, as he does, a very wide difference in showy quality. Exporters have taken several round parcels with both price and grade in their favor.

We quote:—Orange Co. pails, choice, 30@35c., other State pails, 22@26c.; State selections, 28c.; good to prime firkins, 24@26c.; do. half tubs, 24@26c.; do. Welsh, 23@25c.; other grades of State, 18@22c.; Western Reserve choice, 20@21c.; Western fair to good, 13@15c.; common, 10@11c.; grease butter, 7½@8½c.; Pa. and N. J. pails, medium to fine, 23@30c.; poor, 15@18c. State dairies 26@28c. Western is in very light delivery.

Cheese.—The market has had to depend almost entirely upon the home trade the past week. Shippers have found very little encouragement in the tone of the foreign market, the reports from the other side representing decreased consumption with fair stocks. The arrivals have been remarkably light, but there is some further accumulation of stock nevertheless. A good many cheese have been put out in the home trade the past week. Prices have been about steadily held; 13¾ has been paid in instances for best lots of State factory in a small way, but 13½c. is now the top figure for large lines. We quote State factory, choice, 13¼@13½c.; good to prime, 13@13c.; fair lots, 11½c.; State dairy, 12@12½c. for good to prime, 11@11¾c. for fair lots; Ohio factory, 11½@12¾c. for good to prime.

Cotton.—Prices have been steadily declining under the increasing arrivals. Holders are offering their supplies freely. We quote:

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	15¾	15½	15¾	15¾
Good Ordinary	18¼	18¼	18¾	18¾
Low Middling	18¾	18¾	19⅛	19⅛
Middling	19	19⅛	19½	19½
Good Middling	20	20⅛	20½	20½

For forward delivery latest sales on the basis of low middling are at 18⅜c. for Sept.; 18¾c. for Oct.; 18¾c. for Nov.; 18¾c. for Dec.; 18¾c. for Jan.; 19¾c. for Feb.; 19¾c. for March; 20¼c. for April.

Dried Fruits.—In apples one lot of common Southern was taken for export at $1.50; but, as a rule, the best lots only have any sale, the home trade buying a little better. There is some very attractive stock in the market, but, in view of the large crop, buyers name very low figures. Peeled peaches are bought up about as fast as received, with some little speculative feeling. Blackberries are worked off in small lots at 10½c. Cherries are scarce. Quotations are, for Southern apples, 3½@6c.; do. sliced, 8@9c. Peeled peaches at 14@17c. for Ga., 12@14c. for Va., and 14@20c. for North Carolina. Unpeeled peaches at 5c. for quarters, and 6c. for halves. Cherries, 23½c. Plums, 14@19c. Blackberries, 10@10½c. Plums, 14@15c.

Eggs.—Prices have further advanced, with the increased arrivals pretty well sold up. 29c. at the close is paid for Western, 30c. for State and Pennsylvania and 31c. for Jersey.

Flour.—The principal business is still from the home trade, and prices have been forced a trifle, closing with a steady feeling. Shippers have been prevented from buying to any extent by the high rates of ocean freight.

Superfine State	$6 25	@	6 65
Common extra do	7 30	@	7 50
Good to choice do	7 55	@	7 70
Fancy do	7 75	@	8 15
Superfine Michigan, Indiana, Ohio, Iowa	6 25	@	6 65

Choice extra do	7 65	@	8 50
Shipping brands round hoop Ohio	7 45	@	7 95
Trade brands do	8 00	@	9 75
Good to choice white wheat extras	8 50	@	9 85
Fair to very choice extra Minnesota	7 75	@	10 25
Common to fair extra St. Louis	7 60	@	9 85
Good to choice do	9 90	@	11 00
Extra Southern	7 80	@	10 35
Good to choice do	11 40	@	12 50
Rye, common to fine	4 50	@	5 30
Corn meal, Western	3 40	@	3 75

Fresh Fruits.—Peaches have only a nominal demand. The demand for table fruits is turning toward fancy pears and grapes. Cranberries are arriving. A light Eastern crop is reported, and a fair one in N. J. Apples are at the dictation of the buyer. The first rush of Bartlett pears is over, and fine, carefully packed lots to come will bring higher prices than we quote. A great many plums are arriving over-ripe; the same may be said of grapes. Flemish, Duchess, and Seckel pears are in fair demand in the absence of Bartlett. A consignment of California grapes has arrived. They are not in fine order, and include the Tokay, Mission, White Muscatel, and Purple Damascus. They are offered at 25@30c., but move very slowly. High-priced fruit this abundant season is decidedly unfashionable. We quote:—Delaware peaches, best, mostly the winding up of orchards, 50@75c.; a few extra, $1.20; common Del., 30@40c.; N. J. range at 30c.@$1. Bartlett pears, fancy, $15@16 per bbl.; do. fair to good, $10@13 do.; Duchess, Flemish Beauty, and Seckel, $4@9 do.; cooking, $3@3.50 do. Delaware grapes, 12@13c.; Iona, 11@12c.; Concord have a wide range at 3@7c. Plums, fancy, $7@9 per bbl.; Egg, $6@7 do.; Green gages, $6@7 do.; Damsons, $7@9 do. Cranberries, per crate, $4; do. per bbl., $9. Watermelons, N. J., $10@25 per 100; cnlls, $5@6. Nutmeg melons, prime, $2@3.50.

Grain.—For wheat prices are fully 1c. lower. The demand is light from all sources. We quote No. 2 Spring in store $1.52@1.60, No. do. 1 at $1.61@1.64, Winter red Western $1.60@1.73 for new, $1.71@1.85 for amber Western and Southern. Rye is quiet at 78c. for Western. Canada West malt is selling at $1.30. Corn is in active demand and 1c. per bushel higher. Sales at 61@61½c. for steamer lots of Western mixed, 65@65½c. for sailing do., 61@65c. for Western mixed afloat. Oats are higher, with light arrivals; sales at 47@50c. for old, 40@43c. for new, 47@49c. for white.

Hay and Straw.—There has been a scarcity of good hay the past week, and with increased orders from shippers and the home trade the tone of the market is in the seller's favor. We quote new shipping hay at $1@1.05; retail do., $1.35@1.60; salt, do., 55@80c.; clover, 75@80c. Straw at $1@1.05 for long rye, 75@85c. for short rye, 70@75c. for oat.

Hops.—The arrivals of new have been fair and freely offered at a further decline of 5c. per lb. The first lot of new English hops came to hand unexpectedly early in the week and created considerable uneasiness, as it gave promise of an earlier shipment of the crop from the other side than usual. The reports from Germany are of a heavy yield there. In Bavaria there is a decline of fully 50 per cent. since the opening season, with still a downward tendency to the market. The English crop will turn out heavy and the market there is unsettled. The indications are that fine hops only will meet with anything like a profitable sale, as our growers will have to compete this season with the liberal foreign yield. We quote: New York, growth 1872, at 35@37c.; Eastern do., 33@35c.; Western do., 33@37c.

Poultry and Game—Live fowls and chickens are in good supply and prices are in the buyer's favor. Turkeys sell better. Dressed have been sold freely at steady figures. Ducks at 75@$1 per pair. Geese at $1.75@2 for Western per pair; $2.50@$3 for Jersey do. Prairie chickens, 85c. per pair. Woodcock, $1.25. Partridges, $1.37@1.50. We quote dressed poultry at 19@20c. for prime State chickens; 15c. for fair lots do.; 18@20c. for prime State fowls; 15c. for fair do.; 22@23c. for prime turkeys; 18@20c. for common. Live poultry at 17 cts. for spring chickens, Western; 17c. for Jersey; 16 cts. for fowls; 19@21 for Jersey turkeys; 18@20c. for Western.

Provisions.—Prices of pork have been advanced a trifle, but at current prices trade is slow. The jobbing trade are about the only purchasers. Mess, $14.20@14.25 for spot. The scarcity of thin hogs this year will probably send prices of prime mess higher than mess; this feature has been noted before several times in a few years; the latest sales were at $13.25@13.50; extra prime is affected somewhat by the advanced price of prime mess, latest sales at $11.50. Beef hams are quiet at $22@26 for old Western and $30@32 for new. Beef is held firmly at $5@7 for plain Western mess, $8@10 for extra do. Tierce beef at $12@16 for prime mess; $16@19 for India mess. Bacon is quiet and weak, exchange being against supplies; short clear, 9c.; long clear, 8¾c. Dressed hogs are steadily held at 6½@7c. Cut meats sell moderately well at 13@14c. for hams in pickle; 11@12c. for do. in salt; 7c. for shoulders. Smoked meats at 13@16c. for hams; 8¾c. for shoulders; 10@11c. for clear rib. Lard is quiet and steadily held at 9¼c. for spot; 9 1-16 for Oct. New lard 8¾c. City at 8¾c. for steam, and kettle 8¾c. Stearine at 10@10¼c. for prime. Tallow at 9@9 5-16 for city.

Seeds.—The high prices for timothy brings stock in here pretty lively, and prices have declined about 25c. from the highest point. Sales at $3.50@4. Clover is in better stock, with sales in small lots at 9¾c. for Ohio, 10¼c. for Indiana and Michigan and 10½c. for State.

Vegetables.—Irish potatoes are a little more in the seller's favor, especially the best lots. Sweets are in light demand, and in the buyer's favor. The quotations for potatoes are for bulk lots.

Early Rose, bbl., $1.50@2.12; Jackson White, $1.50 @ 1.75. Peach Blows, $2.25 @ 2.50. Tomatoes, 75c. Squash, per bbl., $1@1.50 white and yellow. Cabbages, $8@10. Onions, red, ⅞ bbl., $2.50@2.75; yellow, $2.75@3. Sweet potatoes, $3.25@4. Pickles, $1 per 1,000. Pumpkins, $7@8. Garlic, per 100 bunches, $10 @12. Russia turnips, per bbl., $2.50@3.50.

Tobacco.—Kentucky leaf meets with a good home trade, and, as stocks are steadily decreasing, there is a firm feeling. In Virginia leaf an increased inquiry from shippers is reported. Seedleaf is worked off easily to the home trade at full late prices.

Whisky—Is more in the buyer's favor. Sales at 92¾@93c. for Western.

Wool.—The market for fleeces is unsettled. It is difficult to sell other than small lots, manufacturers being disposed to take only enough stock to carry them along. Slight concessions are offered by holders, but buyers name very low figures. Foreign is steadily held, but there is little or no important demand. Latest sales are of Georgia at 45@48c.; Western at 55@62c.; X and above, Ohio, 59c.; medium Ohio, 62½c.; lambs' pulled, 50@62c.; extra do., 55@62c.; super do., 55c. We quote fleeces at 58@68c. for New York and Mich.; 58@62c. for Ohio; 55@58c. for Indiana and Wisconsin; 50@56c. for Illinois; 40@47c. for Texas fine; 30@35c. for do., coarse. Pulled, 52@62c. for extra.

COUNTRY CHEESE MARKETS.

Little Falls, N. Y., Sept. 21, 1872.

THE market at Little Falls for the week ending Sept. 21st was a little more brisk than for the week previous, but prices continue low and the views of sellers are generally above those of buyers. About 1,000 boxes of farm dairies were delivered and changed hands at 11¾@12¾c., a few fancy lots reaching 13c.

The factories were largely represented, the offerings amounting to some 15,000 boxes, from 5,000 to 6,000 of which were sold. A number of factorymen were unwilling to part with their goods at the rates offered and went home without effecting sales. We give quotations of leading transactions as follows:

Empire	13	Bates	13
M. S. Smith	13	Manheim Turnpike	13¼
Corys	13	Brockett & Peter	13
Charleston 4-corners	13	Coryl	13
G. Ladue	13¼	Eatonville	13¼
Mohawk	12¾	Empire Cheddar	12⅝
Van Hornsville	13	Fairfield Association	13¼
Crum Creek	13	Lasseyville	13
Freeman	14¼	Top Notch	13¼
Dairy Valley	12¾	Middleville	13⅛
Canajoharie	13	Mohawk Valley	13
Newport	13¼	Palatine Union	13
Manheim Center	13⅛	Stone Arabia	13
Old Fairfield	13⅛	Stratford & Salisbury	13⅜
J. D. Ives	13¼	Warren Center	12½
Cayuduta	12⅜	Newville	13⅜
A. Smith & Co	13		

A few packages of butter were sold at 25@26c.

The weather is cool and showery and no frosts as yet in Herkimer to injure afterfeed.

LIVE STOCK MARKETS.

NEW YORK, Sept. 21, 1872.

THE supply of live stock has been large during the week, but cool weather has been favorable for the consumption, and trade has been good for all kinds save poor cattle. In the beef line we have had one of our largest weeks, and had the quality and weight been reasonably good prices would have declined. The contrast is very great between the well fed Durhams at $12's each, and some miserable Texans at $35 per head. Poultry begins to be called for, but there is not enough of it to lessen the demand for meats. More pork is now eaten, and the hog market is very good. Lambs have advanced nearly one cent per lb.

RECEIPTS OF LIVE STOCK.

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.
Totals this week	10,610	66	2,723	28,612	40,312
" last week	8,893	40	2,818	32,150	41,201
Average last year	7,187	88	2,301	25,132	25,177

Beeves.—With one of our largest weeks, so far as numbers go, one would look for a reduction in the price of cattle. This is true of the thousands of poor Texans—3,197 from that State last week—but the contrast between them and prime natives was so great that the latter, which were scarce, even ruled higher. Nothing since the close on Monday has sold quite up to the 15c. of that day, but fat stock was weighed yesterday at 14½c., 60 lbs. to the cwt., with good to prime at 13@14c. The Texans fared hard, butchers perceiving their advantage with so many in the yards and the reluctance of owners to hold such stock over from day to day. Fat native made gentle by feeding will nearly hold their own when held here on good hay, with plenty of water; but take these wild breeds, which sometimes have to be brought down with a rifle, and they fall away in flesh each day they are kept, so owners incline to accept first offers. And yet, when they can get no offers, they are necessarily held over. One lot was so small that they averaged 21¾ to the car load. There is a very good demand for fat cattle.

The following are the closing prices for the week in comparison with what cattle brought one week ago, for net weight of beef:

	This week. Cents.	Last week. Cents.
Choice beeves, ₹ lb	14 @ 14¼	13¾ @ 14
Good to prime	12¾ @ 13½	13 @ 13¾
Medium	11½ @ 12¼	11 @ 11⅞
Poorest grade	7 @ 10	7 @ 10
Average sales	11¾ @ 12	11¾ @ —

Hogs.—The weather is the finest for local trade, and light butcher pigs are much called for. They rule about ¼c. higher than extreme heavy. Few hogs are selling alive, but they are worth 6c. for rough Michigan to 5¾c. for prime Ohio. City slaughterers sell at 6½@6¾c. for heavy, 6¾c. for medium and 7c. for pigs, a few reaching 7¼c.

Milch Cows—Have more inquiry and bring rather better prices, though the trade is far from lively. The beef they would make is still low, and that is a partial guide for milkmen in purchasing fresh cows. Prices range from $35 to $70 per head.

Sheep and Lambs.—Arrivals lighter and lambs are doing much better, with quicker sales of sheep, but at no better prices. Very few go below 5c., and it is only thin which are sold under 5c. Fair to good range from 6¼c. to 6¾c., with extras at 7c. We are getting some calf lambs worth only 5c. ₹ lb. and ordinary lots as they run at 7@7¼c.; decent to good at 8@9c.; prime to extras, 10½@11¼c. Some very choice 70 lb. State sold at 10c. on Thursday. The average of 8,118 sheep and lambs was $5.14 each. Their skins are now worth $1 each.

Veal Calves.—The good feeling of last week still continues, with fewer calves. It is even easier to obtain the outside price of 10c. for fat milk veals. Several hundred of the noted Bucks Co., Pa., calves sold at 10c. right through, with fair to good State at 9@9½c., and grass calves at $5@12 per head. One lot of 132 mixed calves averaged $11.10 each, 211 "grassers" selling at $6@10 per head.

LATEST, Monday, September 23, 4 P. M.—**Beeves.**—Arrivals to-day, 157 cars at Communipaw, 120 at 100th St., and 80 at Weehawken, making 6,373 for the present market. With a perfect avalanche of fresh stock, and 500 stale cattle, the market is demoralized, and prices about 1c. off on all save a few extras, which still want at 14@14½c., but they were premium cattle. Decent little steers sold at 10½c., and fat cattle at 12c. Much stock left unsold.

Sheep and Lambs.—Arrivals for to-day's market, 13 car loads at Communipaw, 26 at 45th St., and 30 at 40th St., making 14,198 on sale. There is a surplus of both sheep and lambs, and prices have declined on all save the best sheep. Thin sheep sold largely at 5@5½c., and fat lambs at 8¼@8½c.

Hogs.—Receipts to-day, Sunday included, 56 car loads at Communipaw and 75 at 40th St., making 13,287. Market steady at 5@5½c. for live, and 6⅝@7¼c. extremes for dressed.

SPECIAL NOTICES.

RUPTURE CAN BE CURED

without suffering. ELASTIC TRUSSES are superseding all others. Before buying Metal Trusses or Supporters, send for a descriptive circular to the ELASTIC TRUSS CO., No. 683 Broadway, New York.

AVOID LEAD POISON.

TIN-LINED LEAD PIPE is a Block-Tin Pipe, heavily coated with solid lead. Tin is a metal closely resembling silver, both in color and purity; hence water flows through tin-lined lead pipes as pure as if drawn through silver. It is as flexible and as easily worked as lead pipe; it is also stronger and more durable. By its use, iron-rust, lead and zinc poison are all avoided, and general health promoted. It is a great benefit to the community, and enhances the real value of every house in which it is introduced. It is also cheaper than lead pipe when strength and durability are considered. Circulars and sample of pipe sent by mail free. Address the

COLWELL, SHAW & WILLARD M'F'G CO., NO. 213 CENTER ST., NEW YORK.

Also, Manufacturers of Block-Tin Pipe, Bar Tin, Sheet Lead, Lead Pipe, Solder, &c. Orders filled at sight.

NATIONAL PARK BANK, NEW YORK, May 19, 1870.

To the Colwells, Shaw & Willard M'f'g Co.:

DEAR SIRS:—Our bank building having been plumbed throughout with your Tin-lined Lead Pipe, we take pleasure in stating that it has worked to our entire satisfaction. Yours respectfully,

J. L. WORTH, Cashier.

I am of the opinion that your Tin-Lined Lead Pipe will, in a sanitary point of view, be of infinite good to our citizens.

WILLARD PARKER, M. D., New York.

THE NOVELTY HAND STAMP,—With complete case of type, for marking Linen, Cards, Envelopes, etc. A perfect Little Gem. Price, $1.00, post paid $1,25, Samples free.

Address F. P. Follett, 3 Asylum St., Hartford, Ct.

PREPARED FLORAL FERTILIZER. The only reliable compound prepared expressly to fertilize House and Garden Plants. *It cannot fail*, if directions are followed. Made under direction of the leading agricultural chemist of the country. Prices—2 lb. cans, 50 cts., or $4.50 a dozen. Enough sent for trial, post-paid, on receipt of 15 cts. Address *Quinnipiac Fertilizer Co., P. O. Box 825, New Haven, Ct.*

WILLARD'S PRACTICAL DAIRY HUSBANDRY: A Complete Treatise on Dairy Farms and Farming, Dairy Stock and Stock Feeding, Milk, its Management and Manufacture into Butter and Cheese, History and Mode of Organization of Butter and Cheese Factories, Dairy Utensils, Etc., Etc.

BY X. A. WILLARD, A. M.,

Dairy Husbandry Editor of Moore's Rural New-Yorker, Lecturer in Cornell University, Maine Agricultural College, Etc., Etc.

THIS is the most full, practical and reliable work on Dairy Husbandry extant; indeed the only one which describes the recent great improvements in the Dairy Business. It is highly commended by leading Agricultural and other influential journals, and must speedily become (in fact is already) the *Standard and Only Authority*. It will pay every one engaged in any branch of dairy business, or who keeps a single cow, to obtain and study this work.

PRACTICAL DAIRY HUSBANDRY embraces **516 Large Octavo Pages,** is handsomely and fully illustrated, printed on superior paper, and elegantly bound. It is a Subscription Book, and a liberal commission is given Agents who canvass Counties, &c. The Agents of the RURAL NEW-YORKER (especially those in Dairy regions) will do well to try the sale of this work. To any person residing where there is no Agent, or who cannot wait for one, the Publisher will send a copy of the work, post-paid, on receipt of the price, $3—(or for $5 the book and RURAL NEW-YORKER one year.) Address

D. D. T. MOORE, Publisher, 5 Beekman St., New York.

RANDALL'S PRACTICAL SHEPHERD: A Complete Treatise on the Breeding, Management and Diseases of Sheep.

THIS Work, by the Hon. HENRY S. RANDALL, LL. D., (author of "Sheep Husbandry in the South," "Fine Wool Sheep Husbandry," &c.,) is the Standard Authority on the Subject. It is the most complete and reliable Treatise on American Sheep Husbandry ever published, and (as the New England Farmer says) "should be in the hand and head of every person owning sheep."

The PRACTICAL SHEPHERD contains 459 pages, and is illustrated, printed and bound in superior style. Twenty-seventh Edition now ready. Sent by mail, post-paid, on receipt of price—$2. Address

D. D. T. MOORE, Publisher, 5 Beekman St., New York.

ALLEN'S AMERICAN CATTLE: Their History, Breeding and Management.

EVERY breeder or owner of Cattle should have this work by Hon. LEWIS F. ALLEN, Ex-Prest. N. Y. State Ag. Society, Editor of "American Short-Horn Herd Book," &c., &c. It is a handsomely illustrated and well printed and bound volume of 523 duodecimo pages. Mailed, post-paid, to any address in United States or Canada, on receipt of reduced price, $2. Address

D. D. T. MOORE, 5 Beekman St., N. Y.

MONEY IN THE GARDEN: A Vegetable Manual, Prepared with a view to Economy and Profit.

THIS Work upon Kitchen and Market Gardening, and the Field Culture of Root Crops, is by P. T. QUINN, Practical Horticulturist, (Author of "Pear Culture for Profit,") and should be owned and studied by every one interested in Gardening. It is an able, practical, profusely illustrated work of 268 12mo. pages. Sent, post-paid, for $1,50. Address

D. D. T. MOORE, Publisher, 5 Beekman St., New York.

"FAMILY FAVORITE!"

THE

WEED. WEED.

The most perfect, reliable and generally useful machine in existence. For the family of the farmer or mechanic, where the work required of a sewing machine ranges from the heaviest garments of man's wear to the most delicate and ornamental fabrics for ladies and children, it has proved itself thoroughly efficient and entirely satisfactory. Of unequaled simplicity and compactness of construction, capable of being learned and operated with one-fourth the usual expenditure of time and labor, with a capacity for quantity, quality and variety of execution beyond its competitors, and a reputation for durability and reliability known and appreciated by thousands, it is offered to the people for the most critical inspection and comparison, with confidence that its obvious merits cannot fail to convince the careful examiner of its superiority. Manufactured by the

WEED SEWING MACHINE CO., HARTFORD, CONN.

REPRESENTED IN ALL THE PRINCIPAL CITIES AND TOWNS.

AGENTS WANTED WHERE NOT ALREADY ESTABLISHED.

The Wheat Field of America!

Healthful Climate, Free Homes, Good Markets.

THE NORTHERN PACIFIC RAILROAD offers for sale its **Lands in Central and Western Minnesota,** embracing: 1. The best of Wheat Land; 2. Excellent Timber for the Mill, the Farm and the Fire; 3. Rich Prairie Pasturage and Natural Meadow, watered by clear lakes and running streams—in a Healthful Climate, *where Fever and Ague is unknown.*

Grain can be shipped hence by lake to market as cheaply as from Eastern Iowa or Central Illinois. Cars now run through these Lands from Lake Superior to Dakota. Price of land close to track $4 to $8 per acre; further away, $2.50 to $4. **Seven Years' Credit;** Warranted Deeds; Northern Pacific **7-30 Bonds,** now selling at par, received for land at $1.10. No other unoccupied Lands present such advantages to settlers.

SOLDIERS under the New Law (March, 1872) get 160 acres FREE, near the railroad, by one and two years' residence.

TRANSPORTATION AT REDUCED RATES furnished from all principal points East to purchasers of Railroad Lands, and to Settlers on Government Homesteads. Purchasers, their wives and children **carried free** over the Northern Pacific Road. Now is the time for Settlers and Colonies to get Railroad Lands and Government Homesteads close to the track.

Send for **Pamphlet** containing full information, map and copy of New Homestead Law. Address LAND DEPARTMENT, NORTHERN PACIFIC RAILROAD, ST. PAUL, MINN., OR 23 FIFTH AVENUE, COR. NINTH STREET, NEW YORK.

C. L. BRYANT, Gen. Supt., Buffalo, N. Y.

GUARANTEED BONDS

On a Completed Road.

THE CINCINNATI, RICHMOND AND FORT WAYNE RAILROAD CO.'S FIRST MORTGAGE

7 Pr. Ct. Gold Bonds,

HAVING 50 YEARS TO RUN, PRINCIPAL AND INTEREST PAYABLE IN UNITED STATES GOLD COIN, "not inferior to the present standard." Interest payable semi-annually in New York, on the 1st day of June and December, and guaranteed jointly and severally by

The Cincinnati, Hamilton and Dayton Railroad Company,

The Pennsylvania Company, and

The Grand Rapids and Indiana Railroad Company.

The road is entirely completed and in operation, and extends from Fort Wayne, Indiana, to Richmond, 90 miles in the State of Indiana, and connects the Pittsburgh, Fort Wayne and Chicago Railway, the Grand Rapids and Indiana Railroad, and the whole system of roads under the control of the Pennsylvania Company in Indiana and Michigan, with the Cincinnati, Hamilton and Dayton Railroad to Cincinnati and Southern Ohio and Indiana. The road is leased for 99 years to the Grand Rapids and Indiana Railroad Company, and operated by it for the joint account of the guarantors, and by a contract entered into between the Grand Rapids and Indiana Railroad Company, the Pennsylvania Company, lessees of the Pittsburgh, Fort Wayne and Chicago Railway, and the Cincinnati, Hamilton and Dayton Railroad Company, for reciprocal interchange of business; all these Companies agree to throw all their freight and passenger traffic which may be appropriately done over this road, thus insuring it from the outset a large volume of business. The holders of these Bonds are thus trebly secured:

First—By a first mortgage on a finished road now in full operation.

Secondly—By a contract for interchange of business with three prosperous and powerful corporations, controlling in its favor a vast amount of business.

Thirdly—By the direct and absolute guarantee of the interest, jointly and severally, by ENDORSEMENT ON THE BONDS by the above mentioned three Companies.

The whole issue of the Bonds is $1,800,000, or $20,000 per mile, and but a limited amount are now offered to investors. Price, **92 1-2** and interest. Circulars and information furnished by

WINSLOW, LANIER & CO.,

5 Beekman St., New York.

CONTRACTS TAKEN!

Rights for Sale.

AGENTS WANTED.

"EAGAN'S COMPOSITION."

(Patented March 5, 1867.)

Used in laying streets, roadways, sidewalks, in lining cellars, cisterns, vats, and in the manufacture of sewers and sewer-pipe, water-pipe, drain-pipe, gas-pipe, roofing and architectural ornaments.

STREETS.

Eagan's Improved Macadam pavement for streets is destined to take the place of all other forms of pavement, for the reasons, viz:
It is cheaper, more durable, more easily and perfectly repaired. Is impervious to water, and no atmospheric change will affect it.
It is free from mud and dust, and is noiseless.
It is smooth without being slippery, and has sufficient elasticity to make it the easiest pavement known for animals to travel over.

DURABILITY.

The reason a Macadam road does not last longer is because the stones are loose and rub and grind upon each other—dust and mud is the result. Eagan's Composition holds the rocks firmly together, thus completely remedying this evil, and confining the wear of the road to its surface.

SIDEWALKS.

Eagan's Composition is peculiarly adapted for sidewalks and lawn walks, private roadways, gutters, etc. It can be made into blocks and laid in squares or diamond form, or made one continuous sheet, covering arched work more perfectly than the largest flagstone, and at one-fourth the expense.
Walks made of it have a smooth, hard and even surface, pleasant to walk upon, always clean and free of ice, and of as great durability as if made of the best flagstone. Sidewalks made under Eagan's patent cost but little if any more than if made of plank, and are as durable as rock.

ROOFING,

Made of this composition, is far superior to the common felt roofs that are made of gravel, felt, coal-tar and pitch. The latter is liable to run in warm climates and to crack in cold. By the peculiar chemical combinations in this composition both of these objections are obviated, and a roof produced equal to slate, at a cost of about one-third as much per square.

CELLAR BOTTOMS AND SIDES,

Lined with this composition, from one to two inches thick, keep perfectly dry and warm in winter and cool in summer, and are rat and vermin proof.

FLOORS.

Floors made of it may be painted any color; and are as pleasant to tread upon as if made of wood.

CISTERNS AND VATS.

Eagan's Composition is impervious to water and insoluble in acids, making it just the thing for lining vats in breweries and manufactories of most kinds. It is equally well adapted for cisterns, much better than the best hydraulic cements, and not subject to decay from any cause.

PIPING.

Piping made of Eagan's Composition has been in use for five years in San Francisco, Cal., where it was first invented. It has given entire satisfaction, almost entirely superseding all other kinds of piping for sewers or drains. It is easily and cheaply made, and has the advantage of being made at any place without a great outlay of money for machinery, tools, buildings or materials.
Pipes can be made of any required size, are cheaper, and will sustain a greater external or internal pressure than any other kind of cement pipe.

CEMENT.

As a cement it is acknowledged, by scientific men who have examined it, to be the strongest known. A wall built of brick or stone, and this cement used as a mortar, would be perfectly solid as if made of a solid rock.

SEA WALLS.

Sea walls can be built with this material in combination with broken rock, more rapidly and cheaper than in any other way.

DIPLOMAS.

First premiums have been awarded to Eagan's Composition from the following Fairs:
California State Fair, at Sacramento, Cal., 1863.
Mechanics' Institute Fair, San Francisco, 1863.
Sonoma County Fair, at Petaluma, Cal., 1869.
St. Louis Agricultural and Mechanical Fair, at St. Louis, 1869.
New Jersey State Fair, 1870.
It has been exhibited at no other Fairs.

RECOMMENDATIONS.

OFFICE OF UNION RAILROAD COMPANY,
ST. LOUIS, Mo., 28th March, 1871.

This specimen of Pacific Concrete, (Eagan's Patent,) was taken from the Union Street Railroad of St. Louis, Mo., where it has been in use since December, 1869. Since that date the teams of the railroad have passed over that portion of the track where the concrete is used, 300 *times each day*, while that same portion of the track is constantly used by other teams and vehicles of the city. This pavement has received no repairs whatever, and shows but little wear after constant use for sixteen months (now 22 months). In summer it is free from dust, and in winter brings with it no inconvenience from snow and ice. The Macadamizing at either end of this block of concrete is renewed three times each year, is soft and wet when much water is used, and in all probability will require such renewing for several years to come before the concrete needs repairing. The block of Pacific Concrete in the track of the Union Railroad has given entire satisfaction. WM. STORK, Sup't.

This Company will take contracts in any city of the United States to make Macadamized Pavements, and will guarantee them to last twenty years, and keep them in repair for a small percentage. Will also supply orders for Drain, Sewer, Water and Gas Pipe. Roofing for sale.

SAM'L N. PIKE, Pres't.
DAVID ALLERTON, Vice-Pres.
W. C. MOORE, Treasurer.
A. WELLES, Secretary.
E. McMURDY, Director.

FISK & HATCH.

TREAT THE HUMAN MACHINE GENTLY.

The winding passage thirty feet in length through which the main portion of the waste matter of the system is discharged, is lined with a membrane as delicate as silk and as sensitive as a net-work of nerves can make it. Neither constipation, colic, diarrhœa, dysentery, or any other bowel complaint, can be cured by abusing and convulsing this tender membrane with a furious purgative. The best and safest remedy in such cases is that mild balsamic and delightful tonic laxative,

TARRANT'S EFFERVESCENT SELTZER APERIENT,

which heals, tones and invigorates the irritated intestines, while it relieves them from the morbid humors which provoke abdominal disease. Sold by all Druggists.

RUPTURE

Relieved and cured by Dr. Sherman's Patent Appliance and Compound. Office No. 637 Broadway, New York. Send 10 cents for book with Photographic likenesses of cases before and after cure, with Henry Ward Beecher's case, letters and portrait. Beware of traveling imposters, who pretend to have been assistants of Dr. Sherman.

BUY THE

SAFE AND PROFITABLE.

THE
CHICAGO
AND
CANADA SOUTHERN

FIRST MORTGAGE SINKING FUND 30 YEARS'

7 PER CENT. GOLD BONDS

INTEREST PAYABLE APRIL AND OCTOBER AT UNION TRUST CO.,
AT
90 AND ACCRUED INTEREST.

This Road is the Western link in the new AIR LINE from BUFFALO to CHICAGO, and runs from the Detroit River to Chicago in nearly a straight line.

The Road is a part of the same line as the Canada Southern and is being built by the same men, viz.: Milton Courtright, John F. Tracy, David Dows, Wm. L. Scott, Henry Farnum, R. A. Forsyth, John. M. Burke, M. L. Sykes, Jr., all directors either in the Chicago and Northwest or the Chicago, Rock Island and Pacific; George Opdyke of the Midland Road; Sidney Dillon, Daniel Drew, John Ross, David Stewart, Samuel J. Tilden, Kenyon Cox, and other prominent railroad men.

The road, like the Canada Southern, will have steel rails (60 pounds to the yard) throughout; is STRAIGHT AND LEVEL; MUCH SHORTER, and can be run with greater speed and safety than any other road connecting Buffalo and Chicago.

The builders of the road control enough of its Chicago feeders to obtain for it a profitable business from the start, having projected the line to accommodate existing business, and having seen the necessity for another trunk line between Chicago and the Atlantic seaboard, located expressly with the view of obtaining the cheapest transportation practicable. Rapid progress is being made in the construction of the Road, and it will be finished at the earliest practicable period.

The branch lines will make the shortest connections between Chicago and Toledo, and Chicago and Detroit, as well as between all these points and Buffalo.

The Canada Southern Bonds, in every particular like these, were eagerly taken, the last of them several weeks ago, by the best class of investors, and were on the market a shorter time than any other railroad loan of like amount for years past.

The proceeds of these Bonds will complete the entire line, and we recommend them with the same confidence as we did the Canada Southern, and regard them as in every way a choice security.

Rural Architecture.

AN AVIARY.

CANNOT you give elevation and plan of an ornamental aviary for suburban grounds? My children are fond of birds; I am glad they are, and am equally delighted with them. The children have been importuning me to build the birds a house. They are not satisfied that the trees are shelter enough. To please the little importuners I propose to build one. Can you help me?—S. P. C., *near N. Y. City.*

OPPORTUNELY the American Builder (Chicago, Ill.,) for August, gives elevation and details of an aviary. We transfer the elevation and sectional view to our columns. The detail is thus sufficiently given without further text. Modifications may be made by the builder to suit circumstances and individual taste and notions. But an aviary is not properly a place where our common wild wood birds will gather for shelter, as our correspondent doubtless knows. It is a provision for birds that are to be kept confined. Such pets are a source of endless delight to little ones, who may thus study their habits and tastes.

POINTING BRICKWORK.

BRICKWORK should never be pointed when the bricks are so dry that they will absorb the water held by the mortar. If mortar of the best quality is employed for pointing brickwork when the bricks are dry, the mortar will be dried so quickly that the lime and sand will not consolidate. In order to solidify, mortar should be several days drying. The correct way, therefore, to perform a job of pointing brickwork so that the work will render satisfactory service, will be to make a mortar of clean, sharp sand, say three parts, unslaked lime one part, and one part of the best Rosendale cement; preparing only a few quarts at one mixing, and using it as soon as practicable. Such work should be done during a cloudy day, after a rain, while the bricks are full of water. In case the bricks are only saturated in part, water should be dashed against the wall until every brick is filled with water. If brickwork were pointed as suggested, the mortar will soon become about as hard as the bricks, and no mortar will flow down on windows during the descent of heavy showers of rain.

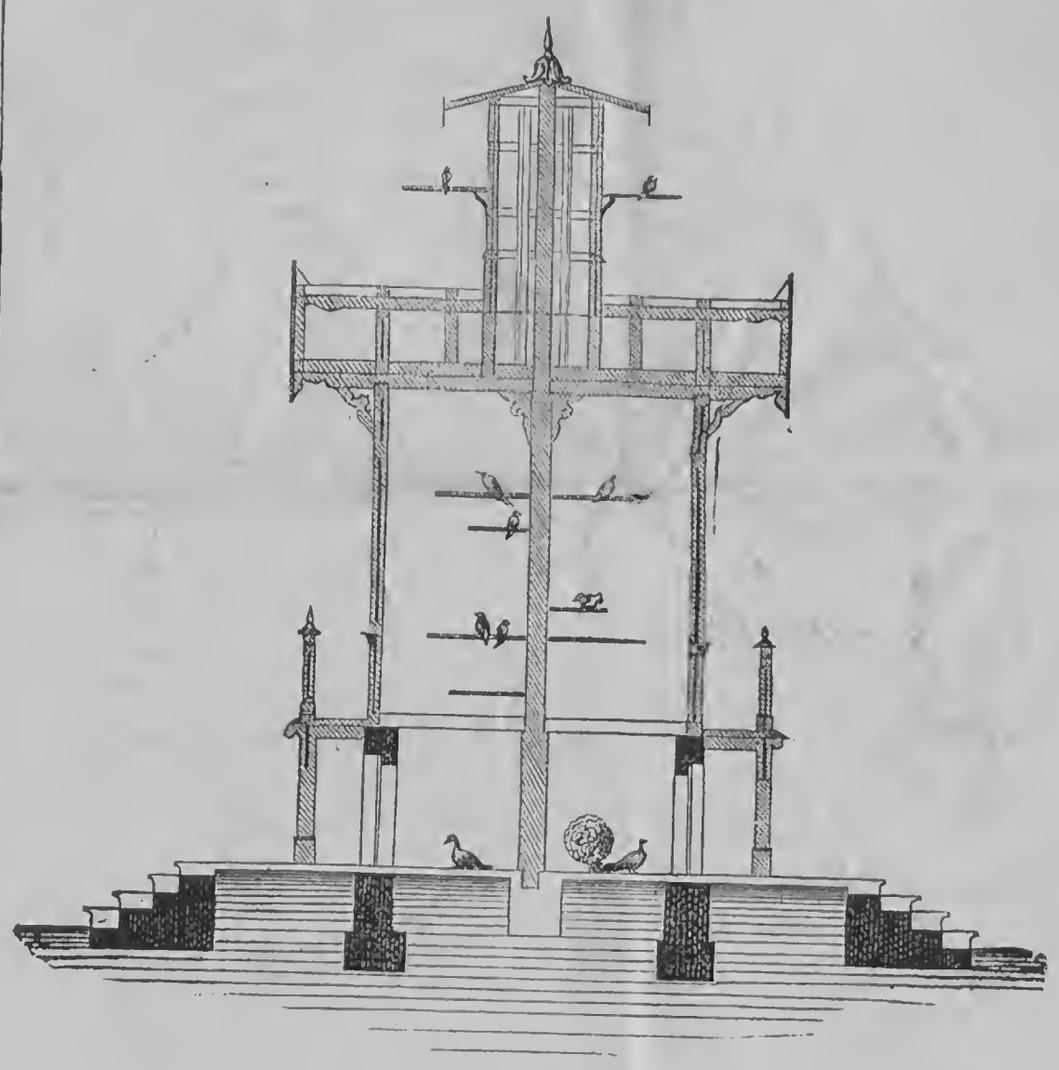
NOTES FOR BUILDERS.

To Estimate Shingles Required for a Roof.—J. D. TATE gives to the New York Farmers' Club a rule for estimating the number of shingles required for a roof of any size; one which he thinks every mechanic and farmer should remember. First find the number of square inches in one side of the roof; cut off the right hand or unit figure, and the result will be the number of shingles required to cover both sides of the roof, laying five inches to the weather. The ridge board provides for the double courses at the bottom. Illustration: Length of roof, 100 feet, width of one side, 30 feet—100x30x144—432,000. Cutting off the right hand figure we have 43,200 as the number of shingles required.

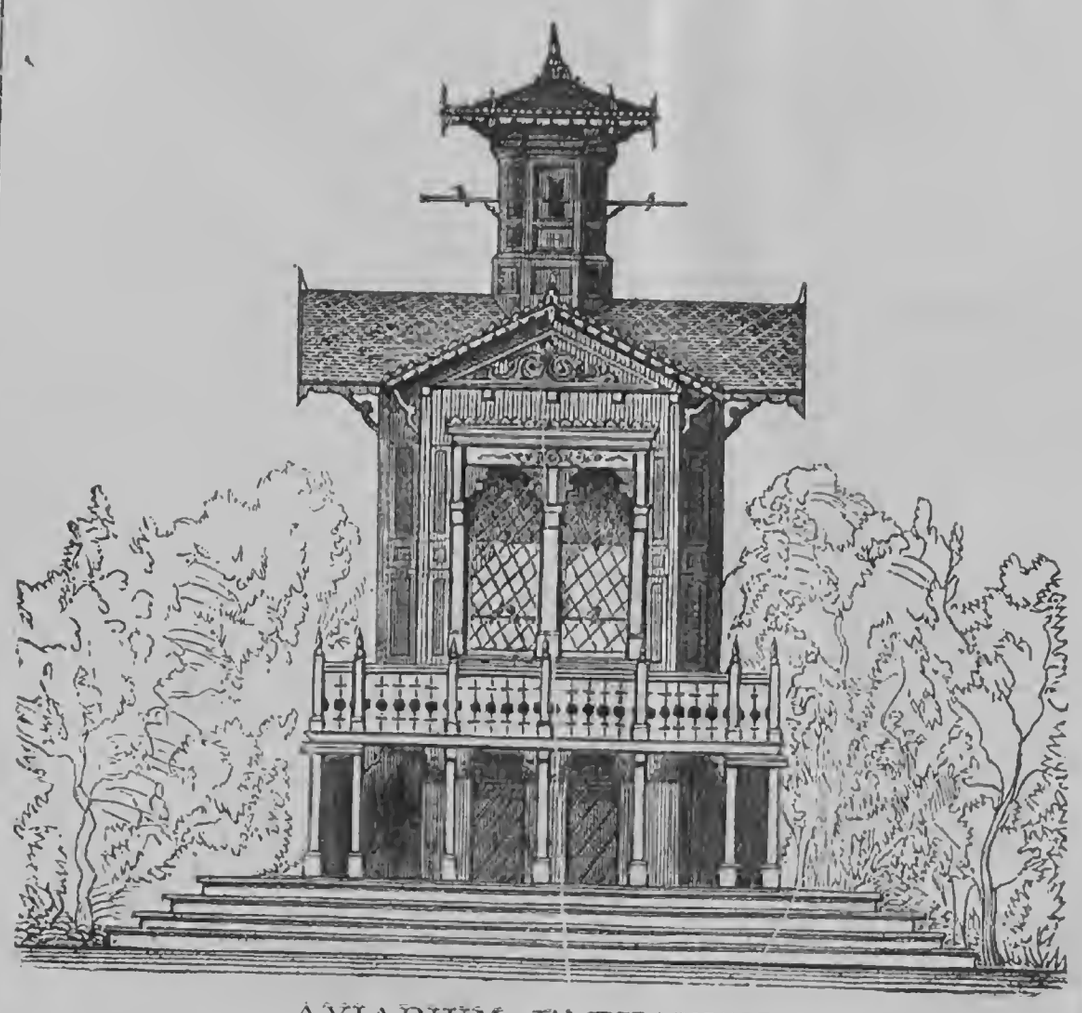
To Construct Gravel and Concrete Walls.—A correspondent asks for the experience and practice of men who have constructed concrete dwellings in the West. He does not want anybody's theory, but somebody's practice and the result.

Re-Clapboarding.—Intending this Fall to put new clapboards on my house, would you oblige me with your advice as to what I should do with the old ones. Should they be put on again so as to form a "dead-air" space, or should I put them on flat and nail the new ones on above?—INQUIRER.

PUT on the old clapboards flat, forming a sheathing, leaving no air chamber, as the overlaps of the new will leave enough air space between. If you lay the old boards carefully they will add much to the warmth and strength of the house—both items worthy of attention.



AVIARIUM—SECTIONAL VIEW.



AVIARIUM ELEVATION.

Dairy Husbandry.

DELAWARE CO. DAIRYING.

MR. P. G. NORTHRUP of Franklin, Del. Co., N. Y., writes us concerning the yield of certain cows in that section. He says: My neighbor, OTIS WHITE, sold from one cow, in addition to milk used in the family, 365 pounds of butter during last season. Mr. MCFARLAN of Bovina, Del. Co., has a cow that has made 500 pounds of butter per year for the last five years. Mr. THOS. MILLER of the same place, made from two 3-year old heifers (Ayrshires) 29 pounds and 6 ounces of butter in seven days, their feed being nothing but grass. From an imported Ayrshire, four years old, 18½ pounds of butter in seven days. ABRAM VAN DYKE of Roxbury has averaged about 250 pounds of butter per cow during the year from a dairy of twenty cows for the last ten years.

He says the Ayrshires sell more readily and for more money than any other breed offered for sale in his immediate vicinity. Referring to the last census he remarks that Delaware Co. has 42,371 cows, producing 5,052,295 pounds of butter, and 35,519 pounds of cheese, averaging 119 pounds of butter and ⅝ of a pound of cheese per cow. Otsego Co., 41,226 cows, which produced 2,811,179 pounds of butter, and 3,335,144 pounds of cheese, averaging 68 pounds of butter and 80 pounds cheese to the cow.

In conclusion he adds as follows:—"I think cows in this county are troubled more with abortion than formerly. A few months ago SYLVESTER WHEAT brought into this town a quantity of 'pure bone dust,' 'bone filings' or 'bone meal' to sell to farmers at 10 cts. per pound ($200 per ton) to prevent (as he claimed) abortion, and did in 'his public lecture,' and has in his 'private talks,' offered such an opinion."

CHEESE FACTORY BOOKS.

WE have a letter from H. & O. B. SWEZEY, factorymen of Harmony, Chaut. Co., N. Y., giving a description of some improvements made in factory acct. books. Many of these books are ruled in long columns, requiring the figures to be added up from top to bottom at one operation and embracing transactions of a month. Factorymen are not always first-rate accountants; and to avoid the liability of mistakes as well as to lessen the labor of adding up long columns, the Messrs. SWEZEY have adopted an extra column of ruling in which every eight days transactions are footed up. They say: "We think we have made a decided improvement in so arranging a factory book that every eight days the weights can be footed up and space left to set it down. Instead of one long column, four short ones are used for each month, and it makes the book in good proportion."

We have submitted the plan of this book, as suggested above, to several persons who are conversant with the arrangement of factory books as generally used, and they have expressed the opinion that the form proposed would be a decided improvement over those in common use. Factory books have been very much improved in their arrangement during the past few years, and we are glad to see any suggestion by which the labor of the factory manager may be lessened and errors in the accounts be made less liable than in books of the present form.

Industrial Topics.

THE "OPPRESSED EMPLOYER."

In answer to E. E., in RURAL NEW-YORKER, Aug. 24, permit me to say:—He says:—"How many farmers are in trouble like SEARS COURTNEY, that have no wealthy relatives to bestow fortune on them, and with all their toil and care and sacrifice can scarcely bring the year round." I say how many day laborers and month hands are there, that have families, who have worked hard and steady all Summer and Fall, or in other words, have worked through the farming season at such wages as they could get, and practiced the most rigid economy, and find themselves unable to furnish their families with the bare necessaries of life, and are out of employ and branded fools for being in that state.

He says there must be large farms in order to provision the world; also there must be employers. I say there will be large farms and brains to carry them on, and, undoubtedly, if he wants to change places with the laborer or enter into competition with him, he can get as good or better pay than he is willing to pay, judging by his tone.

As for the assertion that there must be large farms, I simply answer, from actual observation, that it is not necessary; that if each one who is engaged in agriculture would confine himself to what land he can work and work well, there need be no farms of over forty acres; and I don't believe there need be more than twenty acres of dry land in a farm to raise the staple commodities to feed and clothe the world.

There are forty acres of improved land that I have a chance to see what is raised upon it and how it has been managed for the last ten years. There has been wheat, pork, beef and butter enough produced on this forty acres to feed twenty people, besides leaving enough to provision a family of six or seven. There has also been produced from fifty to one hundred pounds of wool yearly. This forty acres has had two men and one team on it. I could state nearly the actual cost of producing several crops of wheat and corn or about the estimate cost of raising a crop of wheat. It takes here from four to six days' work to raise an acre of wheat—the yield is from five to thirty bushels pere acre—to put in the barn or in the stack. I know not in what locality E. E. lives nor what the price of labor is; but here there is not one in a hundred who could not employ themselves if they saw fit; and there are but few who have not started here with their bare hands and worked out on a farm by the month, while single, or got a team on credit and took land on shares until they got started, and then bought a farm of their own—sometimes running in debt for the whole amount of the price of their land—and have now good homes—many of them are wealthy.

E. E. says:—"Why is this discontent among the employed in city and country?" One thing is, thousands have got rich off of the labor of others, while the laborer has been scarcely able to keep his head above water; again, Congress has passed a law that the government employes only work eight hours. If I sell a farmer a day's work for one bushel of wheat, I expect to give him service so that he can get pay for the use of his land, &c.

I will state here the price of farm labor:—Month hands, for the season, get from $12 to $20, according to their ability; day laborers, $1 and board for common work; $1.50 to $2.50 in haying and harvest. Wheat, $1.25 to $1.50; corn, 40c.; wool, 55 to 60c.; hogs, live weight, $3.50 per hundred.

Your correspondent says:—"The employed will take all they can get and often strive for more;" the employer will hire as cheap as he can—at least I have found that to be the disposition of mankind, regardless of the profit he makes off the labor. When the products of an acre of wheat bring $50, and it did not cost the farmer $5 for hand labor, is there an instance that the farmer raised the wages of his men, until he was obliged to by an increased demand for labor? I think that I have seen both sides of the shield. I have sold my labor by the month, have worked at carpenter work, have employed help on a farm, and have taken jobs and paid men twice what I got for my services.

He says, once laborers would say "I have not earned so much." When was that time that the employer said, "You have earned more, and here it is?" If the good old golden rule was lived up to, this would be a better world.

In conclusion, I am in possession of forty acres of land; and I do know that it pays, as a general thing, to pay the present prices; that occasionally we have to do business at a loss, but the farmer who runs his business with that care and forethought that he should, stands as fair a chance as other business men, and does not run half the risk.

JOHN MCLEAN.

Athens, Mich.

BUILDING ASSOCIATIONS.

I WRITE in hopes I may be able to get some information sadly needed by some of your readers in this part of the country. We have four building and loan associations in this place (Raleigh, N. C.). One of them has been in operation for thirty-four months, consequently the members or stockholders have paid in $34—$1 per month. The ultimate value of each share is $200. The money is put up at auction each month, and that person who will take the least cash for his share gets the money. He then has to give the Association a mortgage upon unincumbered real estate worth in cash the par or ultimate value of the share—$200. He also has to continue his payment of $1 per month, and in addition thereto pay eight per cent. upon the $200. The shares redeemed by the Association have so far been redeemed at an average of about $118 or $120 per share, so that at the present time the shares still unredeemed appear on the books of the Association to be worth about $78 each. The shares now redeemed by the Association are redeemed at about $138 to $140.

Now the information wanted is as to the experience of similar associations in other places upon the same basis. What length of time it will reqire to wind them up; or, in other words, how many years will it probably take to bring the shares to the two hundred dollars each? We would feel obliged if some one, or several, who have had experience, would give the information. Please let them answer through the columns of the RURAL NEW-YORKER at the earliest possible time. This is a matter of information earnestly desired by many.

ONE SEEKING INFORMATION.

LET our readers answer; for though this article has necessarily been deferred sometime it may benefit some one, if not its writer, to have it answered.

The Poultry Yard.

RAVENNA, OHIO, FOWLS.

WHILE passing through Ohio, a few days since, on the line of the Atlantic and Great Western Railway, I stopped off for a couple of hours at the thriving little city of Ravenna, having a curiosity to visit the fancy poultry yards of that place, which I had heard much of and had seen were well represented in the entries of the Northern Ohio Poultry Show. I first visited Mr. J. C. LONG, Jr., Vice-President of that Association, at his place of business, made myself known, and was courteously shown through his yards, which were well represented by the Asiatics and many other classes. Though the birds were in moult, it was easy to see well bred stock; and Mr. LONG informed me he was careful to cull closely, and thus insure fine birds. His Dark Brahmas were large, beautiful birds; the cock had a step as proud as CHESTERFIELD; and the half dozen wives he had charge of showed careful selection either on his or Mr. LONG's part.

Another coop worthy of notice was the Golden Seabright Bantams—a cock and five hens that would have all gone into a pie and could have been devoured by a hungry school boy; such miniature fowls, showing careful breeding, one seldom sees. The Cleveland papers described Mr. LONG's Bantam cock as being about the size of a large Canary bird; and well they might, for he is a beauty. While we stood admiring his carriage, a Partridge Cochin cock in the yard adjoining, that looked as though he might "waken a priest all shaven and shorn," happened to stray a little too close to Mr. Bantam's charges, when he immediately showed game by spurring up to the aforesaid gentleman, that could have swallowed him like a kernel of corn. The contrast in the two was most ludicrous.

Mr. LONG also conducted me to the pigeon house, where could be seen all colors and kinds; Fan-tails and Tumblers were tumbling about in the same house, and all the young coming true to their kind. This some will wonder at; but it is very simple to keep fifty different kinds in the same house if they are only mated beforehand; once mated, they remain truer than most bipeds, from Chicago to Salt Lake City. Mr. LONG'S Light Brahmas were also fine, and his big Light Brahma hen, that won the laurels, is a "buster."

After seeing all that this gentleman had, I "made a break" for the yards of DODGE & KELLY, of Partridge Cochin notority. I introduced myself, and was conducted by the latter gentleman to their "henery." With an ear of corn in his hand, which I noticed was about as enticing to the birds as so many half dollars would have been, for it was evident that they did not suffer from hunger, showing no disposition to eat, and they wouldn't come out to be seen worth a cent; so we were obliged to go to them. These gentlemen, last year, took first premium and special on Partridge Cochin chickens at the N. O. P. Fair, and were offered a hundred dollars for their trio; "and now," said Mr. KELLY, "I have a hen I consider worth more than that trio were."

"Trot her out," said I; but, as corn wouldn't bring her, nor coaxing, we went to her. Well! talk about hens! if here wasn't a beauty (a spring chicken)! I did not think that a fowl could be produced so fine, and I told Mr. KELLY that I thought he would be obliged to have the Standard of Excellence raised about two points all around. I really think she will fill the bill in every point, if she only holds on to "size" as well as she has so far. It is useless to speak of her markings, as all that is necessary, I think, is to turn to the Standard of Excellence for Partridge Cochins and see the description of a perfect hen.

These gentlemen also showed me some fine Buff and Cinnamon Cochins showing careful breeding; and they deserve credit for the interest they take in poultry, as it is far from being remunerative to them, their object being to get birds that will come up to the standard and hold there. Mr. KELLY was offered a good horse for this hen, but refused to take it, as I said before, his object being to get fine stock and not to make money, as is too much the case with many "dealers." I hurried away to the train, then, being amply repaid for my visit, and concluded that Ravenna, Ohio, was quite a fowl place.

ALAN.

Greenville, Pa.

POULTRY NOTES AND QUERIES.

Voyageur (Carrier) Pigeons, hatched this last Spring, were transferred from Chateau Gaillard, to Brussels, a distance of 225 miles as the crow flies. They were let loose at Brussels at 5:30, and the first arrival at Chateau Gaillard was at 10:26; and by 10:48 all had arrived. These young birds traversed the whole distance in four hours and thirty-six minutes; deducting twenty minutes for difference of time dependent on longitude, the rate of speed was nearly fifty miles per hour. This is a tolerable good feat for young birds hatched this last Spring.

Rouen Drakes should have a white ring around the neck. It does not show itself on very young ones, and in old ones it disappears in moulting.

Field Crops.

FIELD NOTES AND QUERIES.

Blue Grass in Texas.—This grass is reported as doing finely in the Lone Star State, wherever it has been introduced. Has any of our correspondents experimented with Orchard grass there?

The Castor Bean Crop of Kansas is said to be large, and a considerable quantity will be exported. Will not some of our readers tell us the net cash result of the crop after it is marketed? We mean of their individual crop.

Robson's Challenge Potato is the name of a new English seedling, said to be ten days earlier than Myatt's Kidney; and for an early kind it is a wonderful cropper, handsome, round, white, and when cooked is found to be beautifully white and of extra fine flavor and quality.

How to Save Clover Seed.—A Canada farmer put a wire bottom in a trough in which he fed his stock—the wire being two or three inches above the close bottom of the trough. The stock, in pulling the clover hay from the rack, would scatter the seed, almost pure, through the wire into the receptacle below. In this way he saved seed enough for his own sowing, and to pay for all the dry-goods used in his family, and received $25 in cash besides.

Pomological.

CANADA EGG PLUMS.

WE have a plum orchard of three hundred trees, of the leading popular market sorts, from which we are receiving very satisfactory returns. We have thirty trees of the Canada Egg—a new variety—set twelve feet apart, occupying one-tenth of an acre. From these thirty trees we have marketed two bushels per tree—sixty bushels—from which we realized four dollars per bushel net—$240, or at the rate of $2,400 per acre net. We esteem the Canada Egg an exceedingly valuable acquisition to our list of early market plums. It originated in Canada, and was introduced here about ten years ago, and has since been cultivated with great success. The trees are hardy, vigorous and healthy, regular annual bearers. Fruit large, roundish, and very showy. Color a beautiful reddish purple, overspread with a thick coat of delicate bloom. Stone very small. Flesh tender, juicy, rich and excellent. Uses—dessert, market, canning and cooking. Season very early—two weeks in advance of any other good market variety. It remains in use a long time, bears handling and transportation well, and is valuable on that account. As an early, hardy, productive and profitable plum for the market and family orchard, we consider this variety superior to any other with which we are acquainted.

N. P. H.

Lowell, Mich.

POMOLOGICAL GOSSIP.

Fruit in Virginia.—There is an effort to counteract the idea that Virginia can only produce tobacco; and that in this it has so far degenerated that all of its tobacco lands are worn out. Some of the Virginians have the idea that this is preventing immigration. This is absurd; and yet this idea may obtain to a considerable extent. There is no doubt whatever as to the capabilities of Virginia for raising fruit of all kinds in great perfection—apples, pears, peaches and grapes. The elevated lands along the base of the Blue Ridge are especially adapted to apples, pears and grapes. About Norfolk, Va., are pear orchards where remarkable fruit is produced—some growers realizing from $7 to $12 per bushel the present season for their entire crops of pears. We have seen excellent grapes growing, and that were grown along the Potomac; and a prominent student and observer predicts that the best wine grapes east of the Rocky Mountains will be produced along the Blue Ridge bases and on its sides.

The New River Boat Apple is the name of a fruit for which it is claimed that it is a seedling of Wythe Co., Va.—originating on the land of GEORGE JACKSON. The fruit is described by C. M. KITCHENS, Browne Hill, Va., as above medium in size, roundish oval, of pale green color, splashed with red, flesh white, rich, juicy and at the same time mealy, sweet, or nearly so, and very small core. The original tree is over seventeen years old, 23 feet in hight, its body being 18 inches in diameter, and the branches spreading 51 feet. It is thrifty, rather upright grower, growing on heavy red clay loam. Season of the fruit is from the 15th of September until the 15th of January—has been kept till March. In 1871 Mr. JACKSON gathered from this tree and put up for Winter use, 78 bushels of apples—it producing over 100 bushels that year. Cannot Mr. KITCHENS send us some good specimens?

Maine Pomology.—Maine has not a State Pomological, and, we believe, no Horticultural Society. We see, however, by the Maine Farmer, that the last day of the session of the State Board of Agriculture, at Skowhegan, Oct. 11, is to be devoted to discussions on fruit, and, if deemed advisable, a State Association, to promote fruit culture, may be organized. We hope such an organization will be formed. Maine needs it, and may profit by it. The pomology of Maine is little known, and this will help to bring it into notice.

A New Seedling Apple.—The new seedling apple received from JOHN DIEFFENBACHER was somewhat decayed when received, but there was enough left for us to get a taste. Its large size, beautiful yellow color, in addition to its fine quality, should make it a very popular variety, provided it succeeds as well elsewhere as in Pennsylvania, where it originated. It is of a rich, sub-acid flavor, fine grain, and, altogether, an excellent variety.

The Naturalist.

MY FEATHERED FRIENDS.

THE fashionable season in bird-life is over—my garden is being deserted. Whole families of aristocratic songsters are daily bidding adieu to familiar places and turning their faces Southward. With them go much of the brightness of the landscape. I miss their merry chattering, their trills of melody and their beautiful plumage. Only a few of the most quiet ones are left, and they, sobered by the signs of approaching Winter, have forgotten their saucy Summer ways and hop silently about in little groups of two or three, quietly picking seeds along the fence rows and garden walls, their sober brown plumage hardly discernible amid the growing grayness of the weeds and flowers.

There is a large brown fellow, with a golden-brown cap, and a black shield on his breast, standing all the length of his long legs in the wet grass, digging his long bill into the ground in search of worms, just under my window. His rich plumage is considerably ruffled from exposure to the rain, but it appears to cause him no uneasiness, from which I infer that he is not a dandy. Not being an ornithologist I must plead guilty of ignorance of his proper name, but acknowledge him a graceful and interesting visitor, and regret that the approaching cold weather must soon drive him to warmer climes.

A pair of yellow birds that set up Summer house-keeping in an apple tree at the foot of the grape walk, where they amused me with their quick, flirting ways and happy songs have long since taken their departure with their five children, whose downy cradle in the gnarled branches of the old tree is still a monument to their parents' ingenuity and industry. Very pretty little neighbors they were, but not quite respectable. They were addicted to petty larceny! In vain did I watch for seeds of choice plants, in vain determine to be first on the ground when *that* capsule should ripen. Approaching, with scissors in hand, a little flutter warned me, there was a quick little exclamation in bird language, a flirt of two yellow wings as my neighbor gracefully sailed away, only to alight at a convenient distance and watch me innocently, while I inspected the empty seed vessels and sorrowfully admitted that "the best laid plans of mice and men gang aft agley."

And then the robins—thievish too! It seems there are no compunctions of conscience among birds. There was a neat little habitation in a fracture of the garden wall, neat, albeit made of mud—which as a building material has no rival among robins—and lined with the softest of white feathers, with four deep blue eggs in, and then one morning—presto! four little ugly birds, whose mouths seemed always empty and always open!

For a time the robins quietly attended to their own business and devoted themselves to the rearing of the four junior robins, which were quietly snuggled down in the home-nest. Many were the caterpillars that Mr. and Mrs. Robin carried home, many the insects they gleaned from the fruit trees in the garden. Never were birds more useful or peaceable neighbors.

By-and-by the currants and cherries began to ripen, and then the redbreasted residents begun their predatory excursions. By this time the baby robins were full-fledged and out of the nest, and had evidently been carefully trained by their parents in the way they should go. And the way they went was to the cherry trees! Not only Mr. and Mrs. R. and their four children, but friends, neighbors, relatives flocked to the scene; robins on the wall, robins in the currant bushes, robins in the cherry trees, robins everywhere! Worms were forgotten—evidently they did not approve of a flesh diet in warm weather, and breakfasted, lunched, dined and supped on cherries.

The robin is an epicure. Catch him eating inferior fruit! Where the sweetest and best-flavored varieties are, there is he also, eating away with a dainty relish, and, no doubt, full of gratitude to the horticulturist for the valuable addition of size and flavor which his care and attention have bestowed. JOHN, the gardener, proposed to shoot the birds. Shoot them, indeed! When all the year they had been busily prospecting after insects, and tirelessly destroying them—to kill them now because they wanted a little fruit! No, no; let the robins eat.

"The laborer is worthy of his hire."

The blue birds puzzle me. An industrious pair have tenanted a little cot built for their especial use, and perched on a pole secure from wandering cats, this season, and there, reared two pretty broods. Occasionally a king bird, whose nest was in a clump of pines not far distant, made suspicious visits to the blue-bird mansion, but was invariably driven off by the watchful inmates. At length the last brood was safely out of the nest, and withdrew with the parents to the woods and fields, rarely approaching nearer, unless tempted by some unusually fine spot for building; he is a strange contrast to the robin, yellow, and bush birds who frequent your very doorstep.

For a long time I missed my little blue-clad songsters, but at length they are back. Not singly, not in pairs, but in a troop, ten, fifteen, being present at once, fluttering about the cot, alighting on it, entering it singly or in pairs, flying, diving, wheeling, with a continual chatter and twitter that fills the Autumn air with subdued melody. Daily, for a fortnight, they have visited the place, sometimes once, sometimes twice a day, and one or two remaining near most of the time. It is a strange contrast to their usual exclusiveness, for the bluebird is jealous, even of his own kin, where his nest is concerned. A pair which for three consecutive Summers builded in view of my window, jealously guarded their nest from other birds, the male keeping up a continual warfare against a brother bluebird that desired to locate a few rods distant, finally conquering his opponent and forcing him to seek another locality for his Summer residence. Hence the friendly relations evidently existing between the members of this bird band, and their curious maneuvers, puzzle me. For what do they frequent the place? Are they about to leave us and are come with all their relatives to bid farewell? Do they dislike to leave and so linger, day after day, while the days shorten and the forest reddens? No matter! They are pretty little neighbors, and their musical chatter on frosty mornings is so pleasant I shall sorely miss them when they are gone to return no more, until another Spring brings the flowers and woos them back.

Hygienic Information.

FISTULA REMEDY.

HAVING once been a sufferer from fistula, I am in duty bound to give the treatment I received. There was a consultation of doctors on my case. Some of them wanted to lay the fistula open with the knife; but the older physicians said, "No; the man is a working man, used to plenty of exercise, so the exercise will keep it open; and if there is anything wrong with the lungs this fistula will carry it away."

So the physicians left my fistula to run itself out, which it did in about two years, and left me a sound, healthy man. I recommended the same treatment to a man named PATRICK FOUD, Flatbush, L. I., last Winter. And Mr. WM. E. MADDEN, who asks for a cure through the RURAL NEW-YORKER can write to Mr. P. FORD, or follow the directions here given:—Wear a belt of muslin around the waist, under the shirt—that is, if the fistula is in the locality of the fundament. Take a piece of fine muslin—about three-fourths of a yard—tie it to the belt behind, bring it under, and tie it in front. This muslin should be changed every night, and the fistula washed with a sponge, and a clean piece of muslin put on again. Let the fistula run all it will; drink plenty of cod liver oil, but avoid drinking intoxicating drinks, and all will be well in about one year.

JOHN WHITE.

New Brunswick, N. J.

THE AGUE POISON.

M. P. BOLESTRA has communicated to the French Academy some observations on ague poison. He says that in examining marsh water he always finds, in proportion to its degree of putrefaction, a granular microphyte somewhat resembling in form the *Cactus Peruvianus*. It is always accompanied by a considerable quantity of small spores 1-1000 of a millimeter in diameter, greenish-yellow and transparent, and also sporangia or vesicles containing spores from 2-100 to 2-300 of a millimeter in diameter, and of very characteristic form. This plant grows on the surface of the water; when young, it is rainbow-like in tints, and looks like spots of oil. At the low temperature of cellars and in water containing no vegetation, it develops slowly, but in contact with air and exposed to solar rays in the presence of decomposing vegetation, it grows fast, disengaging small gas bubbles. A few drops of arsenious acid, sulphite of soda, or, still better, neutral sulphite of quinine, stops its vegetation at the surface of the water, the spores become thin and transparent, and the sporangia alter so that they would not be recognized. These changes may be seen under the microscope. M. BOLESTRA states that these spores can be found in marsh air. He caught agues twice during his researches—once after having been exposed to air from water in fermentation covered with fresh algæ in full vegetation, mixed with an extraordinary quantity of spores. He thinks these spores constitute the ague poison.

HYGIENIC NOTES AND QUERIES.

How to Have Sound Teeth.—The Science of Health says:— Mushes, gruels, puddings, and soups, may be made hygienically. But they should also be eaten hygienically. They must be chewed, not bolted. The nursing infant masticates it's mother's milk, for which purpose it takes it slowly, drop by drop. Mastication is for the purpose of insalivation. Unless food is properly insalivated, it cannot be well digested. The teeth are the finest, densest structure of the body, and this means that they are intended for hard work. Eat solid food at every meal; and when you take semi-liquid, or very soft food of any kind, eat very slowly and take a bit of hard bread, crackers, a green apple, or something similar, with it. Then will your stomach please and be pleased, and your teeth, like your eyes and nose, and fingers and toes, will remain to bless and comfort you to the last. If all persons after being weaned, would only chew their food enough, we would hear very little of aching and rotting teeth, and dentists would be nowhere.

Best and Worst Climate for Consumption.—Prof. ANDREWS of the Chicago Medical College, has been classifying medical facts contained in the census reports of 1860 and 1870, and from these he finds that consumption and cancers are two diseases which are similarly affected by and prevail in the same regions, and that the two laws governing their prevalence are as follows: First, these two diseases are abundant near the sea, and diminish as you recede from it; and second, at equal distance from the sea, they prevail most at the North, and diminish as you go South. From this it follows that the best resort for a consumptive or cancer patient is some point which is at the same time as far South and as far from the sea as possible. Such a place is New-Mexico, where the deaths from consumption are only three per cent., or Arkansas, where they are five per cent.; while in New-England which is colder and sea-girt, they are twenty-five per cent. Entirely in accordance with this rule, but contrary to the popular opinion, Minnesota is a worse place than any other State, having fourteen per cent. of deaths from consumption, though this may be because consumptives are sent there to seek health. Mississippi, Alabama, and Florida have each six per cent.; Georgia and South Carolina five per cent.

Entomological.

WALKING STICK.

I HEREWITH inclose an insect, the name of which I am anxious to learn. We placed a drop of camphor on its head and it soon died. Please give us some information concerning the thing—its name, habits, etc. —C. C. MCINTYRE, *River Fall, Wis.*

THE curious insect, two or more inches in length, very slender body, with long slender legs and antennæ, is the well-known "Walking Stick" (*Spectrum femoratum*, SAY), although, according to the law of priority, it should be known as *Amisomorpha Buprestoides*, as STOLL figured and described it in his great work on Orthoptera, long before Mr. SAY's description appeared. PACKARD, in his "Guide to the Study of Insects," p. 573, figures it under the name of *Diapheromera femorata*, SAY. It also has other synonyms, and you can take your choice. It is a great, lazy fellow, doing no particular harm or good, and being so near the color of the stems of grass and weeds, upon which it is usually found, that few persons ever notice it.

The Swine-Herd.

HOGS IN NEW YORK MARKET.

MISS MIDY MORGAN, Live Stock Reporter for the N. Y. Times, publishes the following, which willl be read with interest by swine-herds:—After careful inquiry among the largest dealers in hogs in this city, we find their opinions to be as follows:—First, that Illinois, Ohio, and Indiana forward Eastward the best quality of hogs, both as to the packing and fresh trade—that is, the hogs are most uniform in weight, the flesh is finest and most firm, while the lard is most abundant and yields a fine quality of both oil and stearine. Second, that New York State furnishes a very poor, washy quality of pork, bad for packing, and still worse for city daily consumption. Finally, that the State of Michigan forwards coarse-boned hogs, fair quality for packers' use, but fully $1 per cwt. less in value than the corn-fed hogs of Illinois, Ohio, and Indiana. The chief cause of the marked inferiority of our own State hogs is that they are fed largely on whey. This poor, innutritious feed is the cause of the soft, flabby flesh of these hogs, which is difficult to preserve when packed, and most unwholesome as food either fresh or pickled. The hogs from Michigan are generally grass-fed, and, if improved in quality—that is, bred finer in bone and heavier in flesh—would speedily come up to the first in rank.

The great point of value in the high-blooded animal is that he thrives on mixed feed and does better on it than a coarse-bred animal on the finest and most nutritious keep. Thus a clean-bred Berkshire, fed on roots and allowed to grub for worms in stubble fields, will fatten more readily when put up for the market than a coarse, common bred hog will, although the latter has been liberally fed from his birth upward. If this were not the case, then high bred animals would be of no more value than common, cold blooded-ones.

The dealer in hogs looks to his profits from the lard only. He has to pay expenses with the profit on the dressed animal. That is, if he pays $5 per cwt., live weight, the increased price per cwt., on the dressed animal, goes to cover the expense of rent, labor and capital invested. Therefore, the net profit arises from the sale of lard. This being granted, it is clear that the hog which yields the finest flesh, the least bone, and the largest quantity of lard is the most profitable for the city dealer, and, being so, he is the proper description of hog for our Western hog-raisers to produce.

If a farmer would successfully compete with other merchants, (for we contend farmers are merchants,) he must know his market, and knowing it, he must supply precisely that which it most needs. Doing this he cannot fail of success.

The loss by shrinkage is a large item in the hog trade, and as this loss has invariably to be borne by the farmer rather than by the dealer, care must be had to raise breeds of hogs that lose little weight in dressing. As matters now stand, Illinois, Ohio and Indiana hogs lose from eighteen to twenty per cent. by shrinkage, Michigan from twenty-two to twenty-four per cent., and State hogs even still more. In finely bred Essex and Berkshire hogs, the shrinkage on dressing is far less. It has been brought down to twelve per cent. in ordinary cases. Call it from fourteen to sixteen per cent. loss, and when we take as we should, into our calculations that these same families of hogs are ready fatteners and thrifty at all ages, and also that their blood improves all other families, we have said much in their favor.

The old Berkshire hog was black and buff color; to-day when bred pure he is all black. The Essex is entirely black and almost free from hair. Both these families are gentle in disposition, and not given to range, so that when put up for fattening they do not fret at confinement but betake themselves kindly to their new mode of life, sleep and feed alternately, and grow rapidly fit for the butcher's knife.

Hogs dressing from 200 pounds upward are, in such a climate as ours, only suited for packing. Light pigs for city consumption, had better not exceed 120 pounds. In the British Isles light pigs, quoted as porkers, sell freely to be used fresh, but American markets as yet are not supplied with such food, although the profit on them could not fail to be fair, as when properly fed the flesh is equal to fine veal, and would sell readily.

The Herdsman.

ESCUTCHEON OR MILK MIRRORS OF COWS.

So little is said concerning the milk-mirrors of cows, that I infer comparatively little, or nothing, is known to what should be, of this, an almost sure method of determining the milk-yielding capacity of cows, or the future capacity of an unyielding heifer—*i. e.*, one which has never brought forth a calf—that I am induced to call the attention of your readers, and more particularly the attention of your correspondents to this subject, which should be understood by all stock raisers, and more especially dairy stock raisers. It was some five years since that I first learned the practicality of correctly judging a dairy cow's value by her escutcheon or milk-mirror. Since that time while attending the Fairs, or visiting private herds, the milk-mirror and the dairyman's record almost invariably agree as to the value of a cow for milk. If a cow is seen at an exhibition pen with a full and extended udder from non-milking it is no sign she is a great milker; but a cow with a good mirror and its outlines clearly marked, a deep udder and extending well forward at its line of juncture with the belly, will not sadly disappoint her milker at the pail. It is a rare thing to find a poor milch cow having a good mirror, but an almost unknown circumstance would be to find a great milk-giver with no mirror.

As some, and probably many, of your readers may not understand the meaning of escutcheon or milk-mirror, it may be well to state that the uprunning hair on

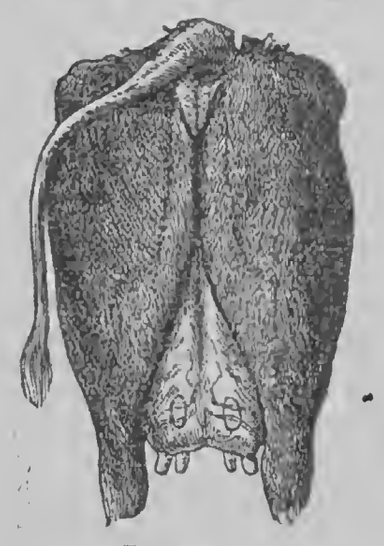

FIGURE 1.

the rear of an animal, on or between the thighs, represents the mirror. The greater part of the hair covering a cow runs down; and in some of the bovines all of that on the rear runs downward too; but that running upwards around the udder is what constitutes the mirror, and the line where the hair running up, meets that running down, is the demarcation of the mirror, and can be easily seen and felt; the termination on the thigh takes the form of a cowlick, or what is sometimes called a rose on the back af a pig.

This mirror assumes various sizes and forms, as will be seen by Figs. 1 and 2; the form given in Fig. 2 being considered supe-

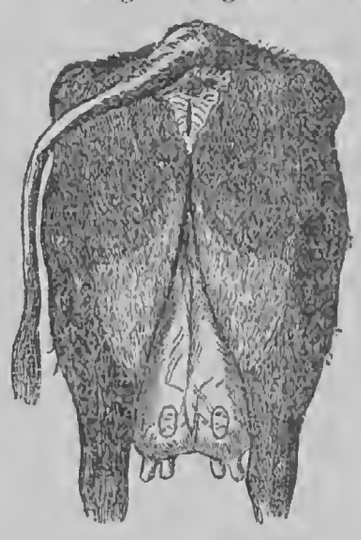

FIGURE 2.

rior to that of Fig. 1, and the broader the mirror the better; this form being considered vastly superior to those where the band is long, at the sacrifice of its width, as shown in Fig. 1. The mirror is greatly damaged by having the hair running downward into the thigh mirror (Fig. 2) and sub-dividing it into parts. Experience and observation convince me that the further the mirror extends on the thighs the better; and that the more easily describable the line of demarcation, the more velvety the touch, and the more regular the outline the more valuable the cow as a milker. If the mirror has a good width, the long vertical band will not injure it; but one usually becomes a sacrifice to the other.

These mirrors are just as easily discernible on steers, oxen and bulls as on cows, and good milking breeds will impart their mirrors to both sexes to an equal degree, and it would be very unwise in a dairyman to have his cows of the best milking strains served by a bull having a poor mirror; still worse, none at all. A calf out of a cow of

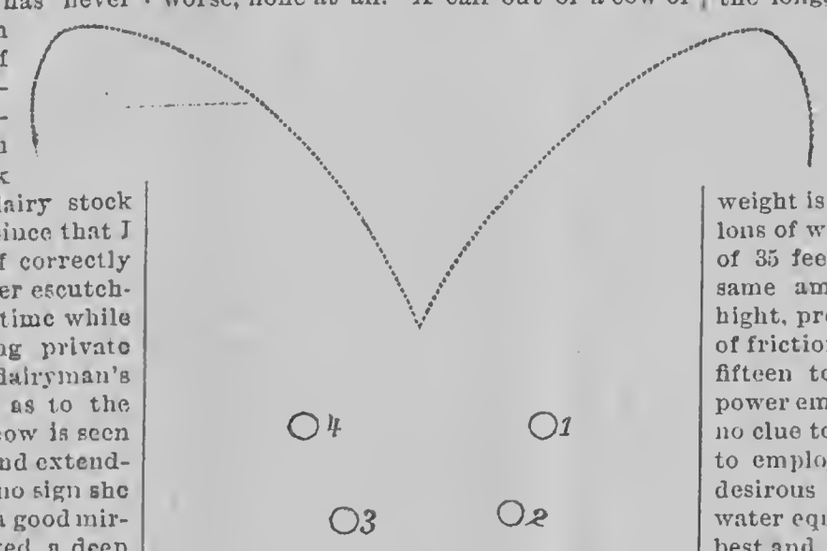

FIGURE 3.

a good milking strain and having a good mirror, and sired by a bull with the same requisites, will almost invariably have an unchangable and good mirror before weaning time.

The mirrors on the front of the bag or udder are important, but difficult to describe and examine. I will throw out a few hints concerning their form and features, and let the reader go to the tronble of practically testing them if he so desire. On the two front quarters are mirrors formed by the hair running backwards over each of them and around the teats up behind, forming the rear, thigh and vertical mirror. The extent and breadth of this, forward, are very important, not only on the udder, but on the belly. In front, midway between the two teats, the hair on the belly runs forward, nearly back to the udder; but the further *front* the line of division between the forward and backward running hair, directly in front of the fore-quarters of the uddder, the more desirable the mirror. Should it extend well up on the sides of the animal, it is a good omen.

This being so difficult of explanation, I have effected another rude drawing to explain the matter. This can be best seen by throwing the animal on its back, and is more applicable to calves than to larger cows or bulls. If a young animal has a thigh mirror like figure 2, and an under one resembling figure 3, it is safe to say it will be a good breeding animal for milk, whether it be a male or a female. If the thigh mirror terminate with a curl or cowlick at the sides, and has the other desirable points, you may rest assured it will be a milking animal of the highest order, if a female, and an excellent breeding animal if a male.

Aside from the mirror, the feel of the skin and its color, the build of the animal, the milk veins and the size of their entrance into the body, all have their weight in determining a good milker, and he who looks at the whole animal instead of solely at her udder, gets the best opinion of an animal's full worth. The amount and quality of feed have very important bearings, as well as the sire and dam.

Merrimac Co., N. H. GEO. R. DRAKE.

NOTES FOR HERDSMEN.

Sour Apples for Cows.—ERASTUS ELLSWORTH, an East Windsor, Vt., farmer, has been trying the experiment of feeding sour apples to his cows, this season, with very encouraging results. Taking a cow from a summer pasture, he commenced feeding her on half a peck of sour apples a day, increasing gradually to one bushel a day, with the result of increasing her milk 50 per cent. in quantity, while that of other cows in the same pasture decreased slightly. He afterward took another cow, nearly dry, from a Fall pasture, and commenced with half a peck per day, increasing as in the former case, and this cow's milk was increased six quarts a day.

Rinderpest and Foot-and-Mouth Disease continues not only to prevail but to increase in nearly all the districts of Great Britain, causing great alarm and resulting in the most rigid measures for its suppression.

Scientific and Useful.

CLOCKWORK FOR RAISING WATER.

A CORRESPONDENT asks if water can be raised by means of clockwork and a weight, and also wishes a description of the arrangement of wheels, etc., required. The question involves a consideration of points which have a very general interest, and as the long, Winter evenings, when hundreds of RURAL readers will be exercising their ingenuity in all kinds of inventions, are at hand, a few words on the subject may not be out of place.

That water may be raised by a weight is obvious enough. To raise 100 gallons of water (about 800 pounds) to a hight of 35 feet, would require a weight of the same amount, falling through an equal hight, proper allowance being made for loss of friction, etc., which may amount to from fifteen to fifty per cent. of the available power employed. Your correspondent gives no clue to the purpose for which he wishes to employ this arrangement; but if he is desirous of simply obtaining a stream of water equal to 100 gallans in 24 hours, his best and cheapest plan would be to pump the water into a tank, and allow it to flow out by means of a self-regulating tap. The amount of water required might be raised to the given hight in less than fifteen minutes, by a moderately strong and active man.

Arraugements of this kind intended for driving sewing machines, churns, grinding apparatus, etc., have been frequently devised and published, and yet scarcely a Winter passes without bringing before the public some wonderful invention by which all manner of work can be accomplished with the expenditure of very little power; at least so run the claims of the inventor. Very few of these devices have come into general use, however, simply because the waste of power is too great for any practical purpose. This waste of power is due chiefly to the enormous friction which is found in all machines where very powerful springs or very great weights are controlled in their movements. Friction is always directly proportioned to pressure, and if we place a weight of one ton on a shaft, the friction on the journals must of necessity be very great. If then this friction should be made to act during a long time, as where the descent of a heavy weight is made to drive a machine for twenty-four hours, it is impossible to prevent its absorbing a large proportion of the available power.

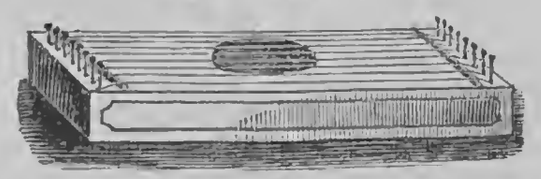
Springs, weights, electro-magnetic machines, and similar contrivances, have been tried over and over again, and have been found wanting, although they have absorbed the best efforts of very able men. There is little hope, therefore, that anything of value will be discovered by working in this direction. And yet, a small, cheap motor, calculated to give about one-tenth of a horse power, and to sell for less than $25, could hardly fail to command a most extensive sale. And when we look at the little engines which are sold for a dollar, it would almost seem that there ought to be no difficulty in devising an engine such as we have mentioned. The fuel must be kerosene or gas; coal, wood, and naptha, being inadmissible. It will be impossible to use either coal or wood without the production of ashes or dirt, and, moreover, fires in which they are used require constant attention. Naphtha is altogether too dangerous, and should never be admitted into a house under any circumstances whatever. At present gas furnishes the safest and most manageable source of heat, and when carefully consumed, in a good burner, it is by no means an uneconomical fuel. But it cannot be had everywhere, and at present it would seem that, unless kerosene can be made use of, the demand for such engines would be very much circumscribed. J. P.

SCIENTIFIC AND USEFUL NOTES.

Galvanic Batteries.—Please inform me the price of galvanic batteries and the effect of their use upon the circulation and action of the human heart; and what advantage electricity is as a tonic.—ADMIRING READER.

GALVANIC batteries may be purchased at from $7.50 to $50 each. Their effects upon the human system are various—depending upon the condition of the individual upon whom they are used. To discuss this matter in full would require more space than we can devote to it and more than would be profitable to the general reader. The galvanic battery should not be used, except under the direction and by the advice of a competent physician.

Æolian Harp.—A correspondent wants to know what an Æolian harp is, and how it is made. It is a simple musical instrument which produces harmonic sounds when placed in a current of wind. It is formed by stretching eight or ten strings of cat-gut, all tuned in unison, over a wooden shell or box, made frequently in the form



shown herewith, or sloping like a desk. The sounds produced by the rising and falling wind, in passing over the strings, are of a drowsy and lulling character, very pleasant to an idle listener. On page 43, RURAL NEW-YORKER, July 22, 1871, we gave detailed directions for the making of these harps. Our correspondent will do well to consult that article.

Stone-colored Wash Wanted.—Can you, or any of your readers oblige me with a recipe for making a stone-colored wash that will be *durable* on wood, without using oil. We have several hundred yards of chestnut, pale fencing here, which I washed over, a year ago with lime and Ohio brown, mixed with water, but it did not stand the weather, and the whole fence looks as clear to day as if it had never been colored at all. —A. B., *Reading, Pa.*

How to Construct a Horse-Power.—Will some of the readers of the RURAL NEW-YORKER please inform me, through its columns, as to the best and cheapest mode of constructing a small horse-power, to be propelled by one or two horses, for running a turning lathe, grindstone, churning, and the like?—V. W. M., *Perry, N. Y.*

The Apiarian.

BEE NOTES AND QUERIES.

Do Bees Prevent Fructification of Seed?—I am inclined to think they do. I am confident my neighbor's bees (he keeps twenty-five swarms) destroyed my buckwheat crop last season. He got the honey, and I got no pancakes in consequence. I believe the honey in the blossom of plants is as necessary to the development and perfection of the seed of the plant as that the sun should shine and rain and dew fall; I believe that this bee-keeping mania in thickly-settled districts is almost as much of a nuisance, and as great a wrong to fruit-growers, as if my neighbor should insist on breeding Colorado potato beetles to feed on my potato vines. Bees that forage on my buckwheat are robbers, and rob me to benefit their owners. I hope this subject will be ventilated, and the rights of those who do not keep bees in some way protected.—ANTI-BEE KEEPER.

Wingless Bees.—Cannot some of your correspondents tell me the cause of so many wingless bees in my hives? There seem to be an unusual number, and I cannot understand it. Is there a remedy for such phenomena? They are driven out of the hives, and fall to the ground. Some have no semblance of wings; others a slight but imperfect development where the wings ought to be. Who understands it?—SEQUITOR.

Italian Bees.—P. R. S., Sharon, Ohio, is informed that it seems to be settled that the Italians are better honey gatherers than the common black bees of this country; that they will lay up honey enough to live upon when stronger black swarms will starve; that they fly swifter (hence, make more trips), and obtain honey from plants from which the common black bee gathers none.

The Frost Grape, as a Honey-Producing Plant, I find has few superiors. I mean *Vitis cordifolia.* Have any of your readers noticed the fact that it attracts the bees in great numbers during its season of blooming. The honey made from it is excellent, and I think it should take high rank as a honey-producing plant.—N. C. WEBER.

To Prevent Swarms Leaving New Hives, it is recommended to move them, as soon as possible, several rods from where they were hived.

Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

Sowing Rye.—*Sept.* 15.—I finished sowing rye to-day, and although a little later in the season than usual, there is still time for it to get well rooted before cold weather. The land was plowed twice and in opposite directions in order to keep it as level as possible. After the last plowing it was harrowed once before the rye was sown, then harrowed twice afterwards, in order to have the seed well covered and evenly distributed. I followed the harrow the last time it went over the field, sowing Timothy seed at the rate of six quarts per acre, then rolled this in with a heavy roller, which left the surface smooth and as level as a man could desire for a meadow. There is no one implement that gives such a finishing touch to land as a roller, and I believe that it more than pays for its cost and use upon both light and heavy soils, not only by breaking up the lumps but by pressing the earth down firmly upon the seed sown. One of our old agricultural writers who long since passed away, said that the science of stirring the soil was "to bring two particles together that had never touched before;" if this be true, then rolling the surface and crushing the lumps is one of the most certain methods of accomplishing our purpose. We know very little of the chemical changes that are constantly going on in the soil, but experience has taught us that thorough disintegration is essential to the growth of all cultivated plants.

Gathering Pears.—*Sept.* 16.—There are very few varieties of pears which are not improved by ripening in the house or cellar. In this respect I believe the pear is an exception to the general rule among cultivated fruits. The Flemish Beauty, if left to ripen on the tree, rots at the core before showing any signs of maturity on the outside. The Louise Bonne de Jersey will often be bitter and quite astringent under the same circumstances, when, if gathered at the proper time, it will have a rich, sprightly flavor, with scarcely a trace of astringency. Early gathering has a similar effect upon nearly all of our choice varieties. The proper time to gather pears is soon after the first specimens begin to turn yellow and show maturity. Of course we are not to take the poor, worm-eaten, immature fruit as a guide, but that which is fully grown. An occasional specimen will begin to color, showing that the crop upon the tree is approaching ripeness. This, of course, will only apply to Summer and Fall varieties; the Winter sorts must be gathered just before freezing weather commences. Another good sign of maturity is the parting of the stem of the pear from the fruit spur. By taking hold of the fruit and lifting it slightly, the stem will part readily if in the right condition for gathering. Summer and Fall varieties may be spread upon shelves in a dark, cool room after being gathered, or in small boxes, the covers of which should be left off for a day or two, or until the sweating (as it is called) of the fruit is over.

If one has but a few dozen specimens of fine sorts, such as Duchess d'Angouleme, Beurre d'Anjou, Beurre Clairgeau, and similar large, showy sorts, it is well worth the trouble to roll each in a paper and then carefully place them in small boxes. These pears, if kept in a cool place, will ripen up slowly and put on a fine color when mature. Even the old Vicar of Winkfield, which most of our pear culturists class among the cooking varieties, will, if well grown and carefully ripened, be quite acceptable as a dessert fruit in January and February. My method of handling this variety is to gather it as late as possible and avoid having the fruit frosted; then put in tight boxes holding about a half bushel, each specimen being wrapped in soft paper. Old newspapers will answer for this purpose, if no better kind is at hand. I then set the boxes in a cool place, giving the fruit a little air for the first week or two; then shut up the boxes tight and leave them in this shape until very cold weather commences; then they are put upon shelves in a cellar. Examine them occasionally, and when they show signs of ripening bring a box, or as many as required, into a warm room and keep them there for a week or more, or until they are fully ripe. A specimen that would be so acid, when first taken from the cellar, or cool fruit-room, as to be considered third-rate in quality, will, in the course of a week or ten days, become quite sweet and good. The same system should be adopted with all Winter pears—at least so far as finishing the ripening in a warm atmosphere—as the saccharine qualities are increased thereby at least one-third. If those who have never tried this process of sweetening their winter pears will give it a trial, I am quite sure they will thank me for this hint.

Banking up Plants for Winter.—*Sept.* 18.—As Winter approaches I make preparations for it in every way possible, because after the first of October we cannot expect much warm, dry weather, although we may have a month or two suitable for out-door work; but it is not best to put off until next month that which can be done now. I like to have all my small fruit plants, such as currants, blackberries and raspberries banked up with soil before Winter, because it not only protects the roots and the lower part of the stems, but also gives the superabundance of water during Fall, Winter and Spring a chance to run off. Shrubbery, nursery trees and small evergreens should be treated in the same manner. I usually begin with those plants that ripen their wood early, ending with evergreens just before the ground freezes. To be certain of getting this work done in time I have begun to-day plowing up to the currant and gooseberry bushes, turning a furrow from the center towards each row. If we have no other pressing work for to-morrow, I will have the black raspberries treated in the same manner, as the lower portion of the canes are fully ripe and banking up will do no harm. The ground is now dry and the plowing can be done in the best manner, while a little later it may be wet and heavy. Then there is great advantage gained in doing such work at odd times and not be obliged to work our horses early and late one week and then let them stand idle the next. For want of proper calculations many a man overworks himself and animals in accomplishing less than his more thoughtful neighbor, who appears never to be in a hurry, but whose work is always done in time.

Another Cistern.—*Sept.* 21.—I have already three large cisterns upon my place, besides a never-failing well. Still the supply of water is not always sufficient for our needs, especially that which is suitable for watering plants. One quite large cistern receives the water from my barn, but it will not hold all that falls upon the roof during the Fall and Spring. The new cistern is to be built of stone, alongside the foundation of the barn, and the dimensions are five feet wide, twenty feet long, and six feet deep. As my barn stands upon a slight elevation, and higher than my green-house, I shall lay a pipe from the bottom of the cistern to the said house, and in this get sufficient force to thoroughly syringe the plants, whenever required, without resorting to hand power. Now, this cistern, like the others upon my place, will be built by my farm laborers, superintended by myself; therefore, the cost will be scarcely perceptible, inasmuch as these men are employed by the year, and must be kept doing something. Two of my cisterns were made by putting the cement direct upon the earth, and the top covered with oak plank; and, although made nine years ago, they are as perfect as when first completed, and have never leaked or failed in any part. These two cisterns, holding about forty barrels each, cost me less than ten dollars each, and were built and finished in two days. It is a shame that farmers who make their wives use hard water for washing, or catch a little rain water in barrels, do not learn how to make a cistern. If they had read the RURAL NEW-YORKER for the past half-dozen years they certainly could have learned the different, as well as the most simple, methods of constructing them.

Bitter-Rot in Apples.—W. W. W. of Clinton, Tenn., says that his apples are badly affected with the bitter-rot, and asks if any one can tell him how to prevent it. We do not know of any better preventive than to plant good, healthy trees of varieties not liable to this disease, and then give good culture. There are varieties much more subject to bitter-rot than others; and in the Middle and Southern States these should always be avoided.

The Salway Peach is attracting a good deal of attention in England. The seed from which it originated was taken from a peach eaten in Italy by Col. SALWAY, and now the fruit has received high awards in the English exhibitions.

Arboricultural.

PLANTING FRUIT TREES.

I HAVE a few apple, pear, cherry, plum, and crab trees to transplant this Fall. Will you please inform me of a good plan for setting them, distance apart, etc.? The piece of land I have is small, and I wish to economize the space as much as possible and not crowd the trees. I have both dwarf and standard pear trees.—B., *Pennsylvania.*

PREPARE your ground by plowing deeply, and if it is subsoiled, so much the better. If not rich, make it so by adding well-rotted manure, and work this in; but if the manure is fresh, spread it upon the surface after the trees are planted. Dig up the trees carefully, preserving as many of the roots as possible, and replant, setting only as deep as they were before. Be careful to have the earth worked in among the roots and firmly pressed down, after which it may be well to stake each tree, in order to hold it firmly in place and prevent the wind from swaying the tops about and loosening the roots. We should also advise pruning the branches, either cutting out a portion entire, or shortening the largest.

Each kind should be planted by itself—cherries in one plot or row, plums in another, and the dwarf pears separate from the standards. The distance apart will depend somewhat upon the varieties, although for garden or small orchards the following will answer:—Apples, standards, 25 ft. each way; crab apples, 20 ft.; cherries, large-growing sorts, like the Bigarreans, 25 to 30 ft.; plums, 12 to 15 ft.; Dwarf pears, 10 ft. If a man will attend to the pruning properly, the trees may be given one-third less space and not become crowded in a lifetime; but in this country we have so much of the "spread eagle" in our composition, that we take more pride in the size of trees than in their capacity for producing a crop of fruit.

ARBORICULTURAL NOTES.

Fire-Blight.—I have in my orchard what is called "fire-blight" in pear trees, seemingly without respect to variety, locality or age of the tree. The leaf or wood of the tree turning black, generally the branches first; the tree soon is infected and dies. If any of your numerous readers know the cause or cure you will confer one of the greatest favors on an old subscriber.—WM. R. ZIGLER.

We do not know of any remedy, although hundreds have been given in the various horticultural journals during the past twenty years.

Inquiry About Hedge Plants.—I want your advice. What can I plant for a hedge around my lawn, and when best to plant—in the Fall or Spring?—J. C. P., *Boston, Mass.*

If you want a hedge that will not be broken by cattle, plant the Three-thorn Acacia (*Gleditchia tricanthos*); but if you want an ornamental hedge, use the American Arbor-vitæ, or Hemlock Spruce. In either case, set out the plants in Spring.

The Vineyard.

GRAPES AT PLEASANT VALLEY AND LAKE KEUKA.

A CORRESPONDENT of the Pleasant Valley Fruit and Wine Reporter for Sept. says:

"THE vintage of 1872 will be light compared with that of last year. What its excellence will be we can only conjecture—but as one of the months has nearly passed that usually exerts much influence for perfectly ripening the grape, and as that month has been eminently favorable, we may be allowed to predict more than ordinary richness for our coming vintage. The lightness of the burthen our vines are carrying, their exemption from disease and the depredations of insect enemies will unite with the favorable heat to render our prediction sure approach toward certain truthfulness. We have recently made a tour of over sixty miles, visiting grape growers and vineyardists through Pleasant Valley and about Crooked Lake.

"In the aggregate, Catawba vines are unmistakably making less than an ordinary good growth, and are showing that the dry weather of much of two years past, the extreme cold of last Winter, with a yield of fruit enormously large, and no adequate compensating restriction upon the service asked of them this year, these are yielding their legitimate results. But over-work, circumstances considered, has by far the larger share in this misfortune to the vine and its owner. We have no doubt vineyardists will find in this mishap a valuable lesson for the future.

"What we have hinted regarding the Catawba may be applied to all kinds grown hereabout that naturally incline to overbear when circumstances are favorable. Concords and Dianas we found making their usual growth. In no instance did we see the crippled, exhausted appearance too often noticeable with Catawba, Delaware and Iona. And when we learned from the vine dresser that a light or moderate yield of grapes rewarded his last year's good care and toil, if either of the named kinds were his this season, the vineyard looks well in growth, and is well fruited now. We offer these remarks as proofs of the ill effects of overbearing.

"In consequence, perhaps, of the smallness of crop compared with last year, we found less clean culture and more weeds, greater neglect in tying up to second and upper wires. Very many growers have wire on hand with which to kindly serve a friend and some to sell.

"The sorts of grapes that appeared to be disappointing expectations and hopes the most completely, are Iona, Israella, and Walter. Empelan has the indulgence of such growers as look to wine making for a little more time. Roger's Numbers find few friends here and there for a trial only as yet.

"And now as to the views of vineyardists with whom we conversed on the quantity of grapes they severally expected to gather this Fall, we have to say, they estimated the yield from a half crop up to good and full. No one placed his crop less than half, more choosing to call their prospective vintage simply light. As regards earliness at which the fruit will be ripe, we place it at an average—neither late nor early. Still the quantity will doubtless favor early maturing."

Farm Economy.

STEAM PLOWING IN ENGLAND.

I NOTICED in the RURAL NEW-YORKER an article on "Steam Plowing in England," in which was a statement made by a correspondent of the Country Gentleman, saying that he had looked *over* England recently with especial reference to the use of the steam plow there, and could only learn that it was "*believed*" to be in use on some of the large farms in the South of England. He concludes his statement by saying "that the old-fashioned way of plowing is the only one in practice in England." I beg to say that this correspondent must certainly have obtained his information of some one that knew very little of "Steam Plowing in England;" and said correspondent must certainly have forgotten the West of England when looking it "*over.*" I left England only two years since, and in the Western counties of England where I was raised, I know the steam plow was very much in use in those days, in the county of Somerset, especially; and from what the newspapers say, that are published in the said Western counties, the steam plow is even *more* in use *now* than it was two years ago.

The statements made concerning the amount of steam plowing done in England are not all false; but the statement by the correspondent of the Country Gentleman, that the old-fashioned way was the only one in practice there, is most decidedly an error. I am well acquainted with the "West of England," also the South, and some of the "Midland counties," and I know the steam plow is much used, especially in the large farming districts, such as Somerset and Dorsetshire.

I am not a farmer myself, and know very little of farming, but I think the farmers of England that use the steam plow are well satisfied that it pays. There is much more farm work done by steam in England than here—threshing, straw cutting, grinding apples, etc. WM. WEBBER.

Rolling Drilled Wheat.—N. G. STEBBINS asks if we would recommend rolling a field of Fall wheat that had been drilled in. We answer, that if we could we would have narrow rollers follow in the path made by each drill tooth, compressing the earth upon the seed after it had been deposited; but we would not advise rolling the entire surface; we should much prefer doing that in the Spring, as soon as we could get on the land with a field roller, after the frost is out.

Domestic Economy.

AN OYSTER CHAPTER.

A famous French cook says the American oyster is, without doubt, the best oyster in the world. Of course, this being the season for them—the months with an R—something more definite about the precious bivalve may be pleasant, at least to new readers of the Rural New-Yorker.

It often is a matter of much convenience to be able to keep oysters alive in the shell, especially when one lives a distance from market. To do this, place the oysters in a tub, with the concave side of the shell undermost, and sprinkle each well with salt and Indian meal. Fill up the tub with cold water, and over the top spread an old carpet or blanket. Freshen daily the water and food. They may be kept in this manner from a week to a fortnight. The tub must be kept in the cellar.

Oysters raw are inexpressibly delicious, if you happen to like them. Wash the shells clean before opening. Serve with vinegar, pepper and salt. Lemon juice is preferable to vinegar. Horse radish is an excellent addition to the lemon juice.

Oysters pickled will give the happy eater an appetite that only another and another oyster will satisfy. They form a very desirable and convenient dish for parties, country "donations," and, in fact, for any entertainment including refreshments. Remove the shells and all pieces of shells from one hundred and fifty fine, large oysters. Lay them in a deep dish and strain the liquor over them. Add salt to taste, as salt adds to their firmness. Simmer over the fire until the oysters are heated through, but not until they boil. Then drain out the oysters, putting them in a stone jar. To the liquor add a pint of cider vinegar, a large teaspoonful of blades of mace, three dozen whole cloves, and the same of pepper corns. Let all come to a boil, and when the oysters are quite cold in the jar pour the liquor over them. They can be used at once—will be better next day—and will keep a week in cold weather.

Stewed Oysters are served as a soup. Open them on a sieve to drain. Put them, with a little more than half the liquor, some whole pepper kernels, a few blades of mace, and some grated nutmeg, into a stew pan. Simmer gently for five minutes, adding, meantime, a piece of butter rolled in flour, or a quantity of sweet cream, which is better. The oysters need only be heated through to be sufficiently cooked. Try one before removing from the fire. When done, turn the contents over buttered slices of thin toast, in a deep dish.

Crumbed Oysters.—Eight square soda crackers, rolled fine, seven ounces of butter, one quart of oysters. Put the crackers and oysters in alternate layers, dividing the butter equally through, and sprinkling a dust of pepper over each one. Use salt sparingly. Have crackers at top and bottom of dish. When ready for the oven, pour over a coffee cup of the oyster liquor. Bake a light brown.

Clams make a palatable breakfast dish, stewed, or made into fritters. They possess tonic properties, and are esteemed by invalids. They may be eaten raw like oysters. To stew, wash the shells clean with a scrubbing brush. Add water enough to prevent their burning and boil until the shells open; then take out and remove the shells. Cook the clams in the same water, adding pepper and butter. Stir in rolled crackers. Long clams are nice broiled or roasted in the shell.

Lobsters.—A live lobster, weighing from one to two and a-half pounds, is the kind to be chosen. To boil, lay it alive in a fish kettle; cover with cold water, cover the dish well and set on a brisk fire. Boil from fifteen to twenty-five minutes, according to size. When boiled, take it from the kettle, separate the body from the tail, and place in a colander to drain. Use everything but the stomach and the black or blueish vein running along its back and tail. It is eaten with salt, pepper, vinegar, oil, mustard and chopped parsley. Crabs may be boiled and served similarly.

Craw-Fish, sometimes called river or fresh water crabs, and often taken for young lobsters, are excellent to eat, decorate dishes finely and are dressed and served like lobsters and crabs.—M.

ODDS AND ENDS.

To Fry Potatoes.—I will send you my ways of frying potatoes. First, take the required amount of potatoes, pare, and slice very thin, and sprinkle salt over them. Have ready a frying pan, with equal parts of melted butter and fat from salt pork, if you have it; if not, use a little less of nice lard; any housekeeper can judge as to the required quantity. Have the fire pretty hot, and as soon as they are nicely browned on the bottom turn carefully, so as to not have them look broken or mussy. As fast as they are brown on the bottom, turn (but not before) until they are sufficiently cooked. We think potatoes fried thus good enough for any one. It takes one-half or two-thirds as long to cook this way as to boil. The other way is to take cold, boiled potatoes, slice thicker than for raw ones, and fry in the same way; the boiled ones fry much quicker.—Mrs. A. A. Ovitt.

Preserving Figs.—Mrs. Carr of California is reported in the Pacific Rural Press as saying at a Farmers' Club:—"A lady at Mokelumne Hill sent me some preserved figs in a jar. They were treated like tomatoes, boiled in hot water, had the outer skin removed, and placed in ginger-root sirup boiled in water till it was flavored with it. When boiling hot the figs were thrown in. They cooked well and without the slightest danger of going to pieces. They were very nice, and much better than preserves made with East Indian ginger. I shall have figs preserved this way. It preserves the flavor of the fig. The liquor is quite strong before the sugar is added."

To Fasten Shells on Picture Frames.—I have made a great many very pretty frames. Take an inch board and make a rough frame of any shape you like and cover with good white lead putty, and then commence with your largest shells and place the putty about as thick as will about half bury the shells; then fill in with small ones according to taste; let them dry and then varnish, and the frame will be as solid as if made of stone.—H. S. R.

Corn Starch Cake.—One cup of pulverized sugar, half cup butter, and stir until it looks like thick cream; one teaspoon soda dissolved in half a teacup of sweet milk; beat the whites of three eggs and put them in with two teaspoonfuls of cream tartar mixed with a teacup of flour; stir and add half a teacup of corn starch; season and bake in a moderately quick oven; frost or not, just as you please.—Olive W.

Floating Island.—One quart of sweet milk, one-half cup white sugar, two eggs; beat the yolks and sugar and stir into the milk just before it boils. As soon as it begins to thicken, remove from the fire; beat the whites to a stiff froth; pour the custard into a dish; flavor with vanilla and then place the whites upon it while hot. To be served when cold.—Delia M. F., *Coldwater, Mich.*

The Pestiferous Cricket.—K. of Oceanica, N. J., asks if any one can tell how to keep crickets away and from destroying clothes. If any of our readers know how to drive these pests away we should be happy to have them give the desired information.

To Pickle Cucumbers in Alcohol.—Take one part alcohol to six of water; throw in your cucumbers as you gather them; lay a cloth loosely over the top, take it off and rinse it (stirring them up) every day.—H. M. G.

Beets and Mangold Wurtzel as Substitutes for Potatoes.—An Englishman says in the Gardener that if these roots are washed, *well baked*, then peeled and eaten with vinegar, they are very palatable, anti-scorbutic, and will keep several days after they are cooked.

French Loaf Cake.—One pound of flour, one pound of sugar, one pound of raisins, a half pound butter, one cup new milk, five eggs, and spice to taste.

Warm Cake.—One cup of sugar, one of butter, one of sour milk, teaspoonful saleratus, two eggs.—Loretta E. Knapp.

To Take Mildew Out of Linen.—Scrape chalk thick on it after it has been spread on the grass after washing. Repeat this several times. Sometimes putting linen or muslin in buttermilk will answer the purpose.—Sarah H. C.

Domestic Inquiries.—A subscriber asks how to make vinegar out of the refuse of grapes after the wine has been pressed out; whether sugar should be added; if so, how much. . . . Mrs. A. L. S. asks some one to tell her how to prepare skeleton leaves, and what leaves are best, when they should be gathered, etc.

Floricultural.

PLANTS FOR NAME.

Rock Cress.—The plant sent by L. E. S. is Rock Cress (*Arabis hesperidoides*), a common weed on the banks of some of our Western and Southern rivers. The plants grow two or three feet high; flower pink, or purplish.

Equisetum Arvense.—Inclosed you will find a species of rush which I would like to have you name for me, as there is no one here that knows it.—Gaylord F. Millard, *Conneaut, Ohio.*

Equisetum arvense, or common Horsetail. By consulting Gray's or Wood's Botany, you will find name and description.

Green Hellebore.—Inclosed please find plants, for which please furnish names. No. 1 is a plant that has been in my garden since my first recollection, put there by my grandmother. No. 2 is a wild Flower taken from the woods by myself and transplanted in the garden, where it does finely.—J. C. N., *Springfield, W. Va.*

No. 1 is Green Hellebore (*Hellebore viridis*). No. 2 we lost or have mislaid in some way; at least we do not find it in your letter. Send us another specimen.

Texas Plants.—I find a great many pretty plants on our prairies, and I try to name them all, but failing, I send them to you. Inclosed you will find two plants which please name. One is an annual; the leaves next to the bloom are silvery white, and growing in large heads as they do is very ornamental. The sap is milky. The other (flower and leaf separate) is a shrub, from eight to six feet high, blooming on the new wood, and is quite ornamental, blooming all Summer. Seed in a pod.—Dick Hopson, *Sherman, Texas.*

The plant with terminal leaves, margined with white, is *Euphorbia marginata*. It is cultivated by our florists and used for bedding out with other variegated leaved plants. The other plant, with small pinnate leaves and yellow flowers, is *Cassia Lindheimeriana*. Our more common botanical works are of very little use to the student who desires to identify wild Texan plants.

Plants from Alabama.—Please give me the names of the inclosed plants. No. 1 grows in damp places. No. 2 is found on the hills, and has a bulb-like root. Where can I get plants of Venus Fly-trap?—A Southern Girl, *Carrolltown, Ala.*

No. 1 is *Platanthera ciliaris*. See Chapman's Flora of the Southern States, page 460. No. 2 is *Bletia aphylla*; see page 456 of the same work for full description. You can probably obtain plants of Venus Fly-trap from the sandy bogs of your own State, as it is quite common in the Northern part of South Carolina. If it does not occur in Alabama write to some one living in the locality we have named. You can obtain seed of it at almost any of our seed stores.

Ailanthus Glandulosa.—Please to name the enclosed, and oblige—Enoch Williams, *Lockport, N. Y.*

The name of the seed sent is given above.

Lungwort.—Inclosed please find a stem of flowers which grow wild on the shore of the Catteraugus Creek; it is called in this locality "Catteraugus Blue Bell." Please give the botanical and common name. The buds that look whitish were a bright pink before being pressed. The plant is perennial; blooms in May.—Old Subscriber, *Springfield, N. Y.*

The common name is given above, and the scientific name is *Mertensia Virginica*, named in honor of Prof. Mertens, of Germany.

Twelve Tender Roses.—Seeing the list of hardy roses, I am led to ask for a similar list of the "monthly rose." They are quite hardy with us. Will not some one give us a list embracing all that may be desirable? If permitted, I would ask "Rural Life" to give us the benefit of his experience with this queen of flowers; and a list of the finest.—Ben. Decherd, *Van Buren, Ark.*

We submitted your letter to "Daily Rural Life," and he replies that to select only twelve best roses from the many fine Tea, Bourbon and Noisettes is almost as difficult as it would be to tell which one of a hundred pretty girls was really the most beautiful. Each particular variety may possess some particular charm not to be found in another; but he writes that he will do with this rose question just as he would do with the pretty girl question—shut his eyes and call the names as some peculiar claim of each came to mind. Here is his list of twelve selected at random from the classes named above:—Aime Vibert, Bon Silene, Cloth of Gold, George Peabody, Hermosa, Isabella Sprunt, Lamarque, Leveren Gower, La Pactole, Phœnix, Pauline Labonte, Souvenir de la Malmaison.

FLORICULTURAL NOTES.

Silver Ferns are said not to succeed well in fern cases. The fronds do not develop well. Only one of them succeeds, and that is *Gymnogramma tartarea*; and it requires air to be freely admitted to the fern case.

Viola Pedata.—Emma R. is informed that this is an American species, very handsome, and quite distinct from other American violets. Flowers, pale purple, white or yellowish at the base of the petals. It is perennial.

The Horseman.

THE TEETH OF YOUNG HORSES.

I find in the Rural New-Yorker of Sept. 21, an article written by C. D. Smead, of Logan, N. Y., headed as above, claiming that wolf teeth in horses are nothing more than sucking tusks, and appear midway between the front and back teeth in the mouths of colts of from two to four years of age, and more frequently in horses than mares. Now, in the first place, I never saw a wolf tooth in a horse's mouth (and I have knocked them out by the score), but what grew tight up against the first grinders, sometimes in the row with the rest of the teeth, and sometimes on the inside of the grinder next to the tongue, but never an eighth of an inch from the grinder, in any case.

In the second place, I find them growing just as often in horses from four to eight years old as I do under that age, and frequently in old horses. According to the best of my recollection I have found them more frequently in mares than in horses. They have been invariably accompanied with sore eyes, which could not be cured with medicine so but what they would soon become sore again, until the teeth were knocked out, when the sore eyes would get well immediately.

I have had horses come to me with sore eyes and could find no wolf teeth, and told them to doctor their horse's eyes for inflammation, which they did for several weeks to no purpose, until the poor animals were nearly blind; then they have brought them back to me again to look for wolf teeth, and we found them on the inside of the grinder next to the tongue, entirely out of sight, unless you looked in from the other side of the mouth from that the tooth was on. After knocking out the teeth the sore eyes got well right along, and they never have had any more trouble with them.

My opinion is that your correspondent has never seen any wolf teeth, and, of course, his theory is correct with regard to the tusks, for wolf teeth never grow where tusks do. But let authors and surgeons say what they please, I am satisfied that wolf teeth will make horses blind unless they are taken out. H. C. Morgan.

Catharine, N. Y.

NOTES FOR HORSEMEN.

Ringbone Remedy.—F. S., in Turf, Field and Farm, gives the following:—I gave you two recipes for the cure of ringbone on a horse, and, in answer to many: First—The best treatment for ringbone of either kind is, after the inflammation has been in a great measure removed by cooling applications, to fire the part, or, in other words, well rub in the iodide of mercury ointment, washing off the parts on the following day, and then repeat it again and again. By such means you will succeed in removing the lameness, diminishing the enlargement and restoring the animal in many cases to a state of usefulness. Second—Foment the parts daily for a week, or keep them covered with a damp bandage in case there is much inflamation and local tenderness. Then rub in the following energetically for five minutes:—Powdered cantharides, one dram; red iodide of mercury one-half dram; camphor, one scruple; spirits of wine, one dram; lard, six drams. Add the spirits of wine to the camphor and then rub up all into the ointment. At the end of twenty-four hours, apply fresh lard over the blistered surface, repeating it daily until the scurf comes off; then if it be necessary a second application, and after that a third may be made. A proper adjustment should be given to the wearing surface of the hoof and shoe, as failure sometimes results from neglect of this precaution. Should lameness persist it may be advisable to proceed to the extreme measure of using the hot iron, for this, however you would need professional assistance.

The Literary World.

NEW PUBLICATIONS.

The Increase of Crime and its cause, with a few solid questions. By ANNA B. BOONE.

THE general reader, uninformed as to the life struggles of Mrs. BOONE, would regard this volume as containing too much that is personal to herself and family. It is full of digressions from the discussion of the main topic, and yet there is little in it that is irrelative. With all the faults of construction that a critical mind might discover, it is full of wholesome truth, unaffectedly expressed in an original manner. It is exceedingly readable, and is a little volume that it will benefit any woman, young or old, to read. It deals with the woman question as most women would who believe in wifehood and motherhood as the crowning glory of women; makes love of money the root of all evil and denounces fashionable folly, frippery and ignorance with unsparing words, and commends virtue and intelligence as the true foundation of good society.

The School and the Army in Germany and France. With a Diary of Siege Life at Versailles. By B'v't Maj.-Gen'l W. B. HAZEN, U. S. A. New York: Harper & Brothers. 1872.

A READABLE, excellent, interesting and valuable book, by an army officer, who was granted leave of absence in 1870 to witness the conflict between Prussia and France. He had every opportunity for studying the armies of the two nations, the modes and habits of the different peoples. Ever having the improvement of our own condition in view, he has made many valuable suggestions. He criticises us with intelligence and frankness, and points out much which is good in France and Germany. The book should become popular, and is well worth reading by all classes. It is a large and handsome volume of 400 pages.

Law of Horses: A Practical Treatise on the Law of Horses, embracing the Law of Bargain, Sale and Warranty of Horses and other Live Stock; the Rule as to Unsoundness and Vice, and the Responsibility of Proprietors of Livery, Auction and Sale Stables, Innkeepers, Veterinary Surgeons and Farriers. By M. D. HANOVER. Cincinnati: Robert Clarke & Co. 215 pp. Price, by mail, post-paid, $3.50.

THE author of this handy book of horse law, seems to have ransacked the archives of courts and statutes for decisions and enactments bearing on the whole question of contract, warranty, fraud and responsibility. Very many of the little law suits in country courts arise from fraud or imposition in selling or swapping horses. In this book we have a perfect encyclopedia of the law and custom on these questions, and all magistrates of the minor courts ought to have a copy for information and reference.

Practical Trout Culture. By J. H. SLACK, M. D. New York; Geo. E. Woodward.

DR. SLACK speaks of what he knows, and testifies of what he has seen. He is the Commissioner of Fisheries in N. J., the Natural History Editor of "Turf, Field and Farm," and has extensive trout ponds of his own. In the excellent little work of 150 pages which he has given us, and which sells for $1.50, he sketches the history of artificial propagation of fish, and then describes the *modus operandi* at length, in a clear and concise manner. The book is profusely illustrated, and is interesting to read, even by those who are not interested in fish culture.

Medical Electricity: A Manual for Students.—By WILLIAM WHITE, M. D. New York: Samuel R. Wells.

DR. WHITE is a Professor in the N. Y. Medical College for Women. He has produced what we consider to be a valuable and useful book, as well adapted for families as students. The matter of the book is so simple any one may understand it. We know from experience that electricity is a valuable and powerful remedial agent, which deserves to be better known.

Unawares. By the author of "The Rose Garden," Miss PEARD. Boston: Roberts Brothers.

THIS is a French love story, with none of the objections common to such works. The tone of the book is high, the style is pure, the sentiment is elevating, the story is vastly interesting, and the characters are drawn by a master hand—every stroke of the pen bespeaks the artist. The point of the story is this:

> "Thrice blessed are the pure in heart,
> For only they shall see GOD'S face."

And yet there is no pietism or cant in this book; it is beautiful, healthy, and wholesome. The character of M. Deshoullieres and Mademoiselle Therese are greatly to be admired. The book is worth reading if only to know what Miss PEARD says of the cathedral at Charville.

FLOWERS, WINDOW GARDENING.

LADIES, SEND FOR SPECIMEN COPY (FREE) OF

THE LADIES' FLORAL CABINET,

AND PICTORIAL HOME COMPANION.

You will surely be DELIGHTED. A beautiful Paper, devoted to Illustrated Home Reading, and more especially to the Culture of Flowers for the Flower Garden, and Plants for Window Gardening or In-Door Ornament. Embellished with many exquisite Illustrations, and printed in superior taste. Tells the Ladies all about Window Gardening, Bulbs, Lilies, Verbenas, Bedding Plants, &c., &c. Cannot fail to be heartily welcomed as a general favorite among all flower lovers, or a charming Companion for every Parlor or Country Home.

The First and Only Paper of its kind in America.

Very Cheap—**Only 75 Cents per year.** Clubs wanted everywhere. Ten copies only 60c. each. Specimen Copies free. A trial trip 3 months, 25c.; 6 months, 50c. A package of flower seeds given to every one bringing a new subscriber or club. Please state where you saw this advertisement.

WINDOW GARDENING.

A New Book, with 250 Fine Engravings and 300 Pages, containing a Descriptive List of all Plants suitable for Window Culture, Directions for their Treatment, and Practical Information about Plants and Flowers for the Parlor, Conservatory, Wardian Case, Fernery or Window Garden. Tells all about Bulbs for House Culture, Geraniums, Hanging Baskets, Insects, Plant Decoration of Apartments. The illustrations are unusually beautiful, and many of them perfect Gems of exquisite beauty. It is a valuable Book, long needed, and will be highly appreciated by all flower lovers. It is a perfect gem for any parlor table, and a splendid gift to any lady friend. **Price, $1.50,** by mail, post-paid. Agents wanted. A copy can be sold at every house. Prospectus of it free on receipt of stamp.

EVERY WOMAN HER OWN FLOWER GARDENER.

BY "DAISY EYEBRIGHT" (Mrs. S. O. JOHNSON).

A delightful little Treatise on Out-Door Gardening for Ladies—Practical, Timely, Charmingly Written. Cannot fail to be universally liked. Valuable Information about Pansies, Roses, Geraniums, Climbing Plants, Annuals, Perennials, Fuchsias, Ribbon Beds, &c. Send for it. Printed in excellent taste. **Price, 50c.,** post-paid. Bound in cloth, $1. A copy free for club of ten.

Ladies' Cabinet Initial Note Paper.—A superb novelty in Stationery, with tinted paper. Splendid Initial. Perfumed. Illuminated cover. Price 50c. per box. Each box also contains a package of Flower Seeds.

100 Papers at Club Rates. Every paper 25c. to 50c. less than full prices. You will save money by Clubbing all your Papers together. Send stamp for List.

Three Months for Thirty Cents.—A trial trip with the HORTICULTURIST and Journal of Rural Art and Taste. NEW QUARTER—TRIAL TRIP!

THE RURAL NEW-YORKER this week enters upon the last Quarter of its Twenty-Third Year, and we hope to render its Thirteen Numbers more valuable and interesting than those of any preceding quarter since its establishment. Friends will bear in mind that we offer this Quarter, On Trial, at a reduced price,—and a handsome prize to every one sending either $5 for ten Trial Subscribers, or $3 for a copy of the paper for fifteen months from this date. For particulars see last column of this page.

—To meet the great demand for the Trial Quarter—a demand already large—we add several thousand to our regular edition, and shall probably be able to fill orders for the entire quarter's numbers for some weeks to come. But so long as the extra edition lasts our rule will be "first come first served," so that those who wish to secure all the numbers from this date should order early. Please tell all your friends—and especially borrowers of the RURAL—about our offer.

AM. INST. FARMERS' CLUB.

THE Club met at the usual hour, Sept. 20. Attendance as usual. A few strangers were present.

"Scuppernong" Grapes,

so called, were shown, from North Carolina. The Chairman doubted if they were Scuppernong. He had a grape he had grown for many years under the name of "Charter Oak," between which and this "Scuppernong" he could detect no difference. Other grape growers present held the same opinion, one prominent one asserting that if this was a Scuppernong he had never seen one before, except under the name of Charter Oak; and he had received many so-called Scuppernongs from the South.

Florida

was written of by a correspondent who had been six years in that State and who said thousands came there annually to escape the rigors of Northern Winters—many in the last stages of consumption who left home and its comforts and friends only to die there; others reached there before the disease had done its work, were benefited while they staid, but were in too great a hurry to get home, and the next Winter they die; one in a thousand stay until they are well; more than half of these are attracted to the banks of the St. John's River, where they shake what the consumption has left of them into a perfect bone-bag. The fortunate few keep away from the rivers and swamps, upon the high pine lands, and get well. If invalids were posted before they came, they would keep away from the "hotels kept for the accommodation of invalids," and away from the rivers and swamps.

Gas Lime for Louisiana Soil.

A Louisianian says his soil is deficient in lime, and lime and gypsum are costly; has been advised to use gas lime, but asks the Club if he shall. He is advised not to do so, but to buy some limestone up the river and burn and apply it himself.

A New Seedling Crab Apple

was forwarded by W. H. BAILEY, Plattsburg, N. Y., which he represented as a cross between the large red Siberian Crab and Fameuse. It was a beautiful, good-sized crimson crab, resembling the Fameuse somewhat in color and marking, but in no other sense; and it was doubted if it was in any way related to it. It was a very good fruit of its class.

Apples for Name.

A lot of apples were sent the Club for name. The sender was recommended to send the fruit to CHARLES DOWNING, Newburgh, N. Y., with a liberal compensation for the labor and time he must expend in naming and labelling such fruit. And those who send fruits in quantity to any one to name were advised to number them, keeping duplicates with corresponding numbers, and send descriptions of the habits of trees which bore them and a history of the same—where they were obtained, if not seedlings. The manner in which most fruits are sent to pomologists for name reminds us of the patient who wrote the doctor that he was sick, asking him to tell him what the matter was and prescribe for him.

A Jerseyman's Peach Tree

puzzled him. It had never ripened any fruit; it was broken off by a storm, leaving only a stump; from the stump sprang two branches; on one branch excellent peaches grow and ripen, on the other, the original fruit, which does not ripen, appears. A Jerseyman present, familiar with "yellows," says trees affected with this disease ripen the fruit prematurely, and it is probable the branch that ripens the fruit is diseased and that the other will be soon.

Horse-Radish and Turnips.

A lady asked how much horse-radish an acre of land will produce, how it should be cultivated and prepared for market and whether there is a good demand for it in large quantities. The Commander said the amount that could be produced on an acre depended upon the number of turnips growing near that can be grated up with it; for horse-radish is largely adulterated in this manner and sold at high rates. There is no doubt as to its profitable culture and the continuous demand for it.

The Profit of Bee Culture

for women was urged in a speech by Mrs. E. S. TUPPER, who gave instances of success enforcing her faith in this vocation, especially on the prairies. And she urged that city people might keep bees with profit on their housetops. She urged that the Italian bee was the best stock to keep, but she did not say whether or not she thought it just for people to keep bees to destroy their neighbors' fruit, as there is abundant evidence they do to a disastrous extent when kept in large numbers near vineyards and orchards.

RURAL NOTES AND QUERIES.

The Western New York Fair—held at Rochester last week—was largely attended, and is pronounced a success in all respects, especially financially. The officers are entitled to credit for the general good management of the exhibition. President WHITCOMB, Treasurer OTIS, Secretary GARRETSEE, as well as the Superintendents and their Assistants, were indefatigable in their efforts to meet the wants of both exhibitors and spectators. W. C. BARRY, Sup't of Floral Hall, managed his department in an admirable manner, his efficiency and courtesy giving great satisfaction. We congratulate both managers and exhibitors upon the gratifying success of the second Western New York Fair,—about which more anon.

Educating Farmers' Children.—The Napa Co., Cal., Farmers' Club has been discussing this question:—"How are we to best educate our children in order to make them useful members of the community?" One member thought this a metaphysical subject, fit only for the student, and not a proper subject to be discussed by the Club. We hope all were not of this gentleman's way of thinking. We can conceive of no more important subject relating to Agricultural progress. It lies at the very foundation of Agricultural prosperity in this country. It is the very essence of success. We should be glad to know that every Farmers' Club in the United States made it a special subject for investigation. It will be well if the fact is recognized by farmers that education is not simply what the student learns from books and by the aid of schools and colleges. True, it is education the young man receives who spends three or four of the best years of his life in college; but is it the *best* education to fit him for the duties of practical life? May he not acquire as good, as useful, as compensating an education between a pair of plow handles, if his leisure time is properly employed and his mind properly directed—if the spirit of inquiry is properly stimulated and habits of observation and generalization are properly formed? It is not a metaphysical, but a practical question.

The Milk Producers' Convention in this (N. Y.) city held a two days' session Sept. 24 and 25. The object of this Convention was to unite milk producers in the organization of a company which they could and should control and through whose agency they can get a fair share of the value of milk for producing it. The new company proposes to insure the producer six cents per quart for his milk. The amount of milk received daily in the city being 320,000 quarts, at six cents per quart, would amount to $19,200; freight added, $4,800, will make an outlay of $24,000 daily. It is estimated that a profit on this milk of $950 daily may be made. Deducting interest on the capital stock ($400,000) and incidental expenses, the net profit after receiving seven per cent. interest on the outlay, is put at $250 daily. The two days' session, however, did not result in a consolidation of the producing interests. Two farmers' companies are already formed. Efforts to consolidate these two failed. There was a great deal of acrimonious wrangling, and the Convention finally adjourned without having accomplished the purpose of its projectors. But much light was thrown upon the milk business in this city, the tendency of which will be to make all consumers more watchful, critical and exacting of those who supply them with milk. Our own opinion is that such a combination as that proposed would be no special gain to consumers however it might benefit producers; and that two companies are better than one for both producer and consumer. We are opposed to monopolies, no matter by whom organized.

Naming Animals.—A contemporary has some very sensible words about naming horses. These remarks should apply to the naming of all classes of thoroughbred animals. There is a great confusion of names. It is suggested in the article referred to that the name of the horse or mare should bear some relation to the name of the sire or dam. With some breeders this is the practice. For instance the male offspring of a bull named, say, "Eureka," are successively named "Eureka 2d," "Eureka 3d," etc.; and the female offspring of a cow named, say, "Tulip," are named successively "Tulip 2d," "3d," etc. Care should be taken by breeders not to adopt names previously given to animals. In some cases it is a good plan to name the first male animal bred by a young breeder whose name is, say, BROWN, "Brown 1st," and the successive ones "Brown 2d," "3d," etc.; and the females, "Mrs. Brown 1st," "2d," etc. This may be done where the animals bred from do not hold prominence in the breeding world. This course interests the breeder in the reputation of animals bearing his own name and incites to skill and painstaking. These are simply suggestions. More might be given. But the importance of some uniformity in naming animals, and the practical benefits to follow, seem to us apparent.

A Woman's Indignation broke out in our office, the other day, against the stupidity of Fair managers and judges. It was refreshing. The woman knew what she was talking about, knew that she was right, saw the shallowness of the present system of awards, and "went in" strong on the "righteous indignation role." Three awards had been made to three animals in which she had a personal interest, the first prize having been given to the poorest animal and the third prize to the best! Was there ever better reason for being indignant!—such injustice done her favorite filly and such silly stupidity on the part of men who ought to have known better! If it would do any good we would tell the lady's name—but it wouldn't. But we would rather trust her judgment in the case than that of any three men likely to be picked up on any one Fair ground the same day.

Technological Education.—Boston *is* the hub of many good things—from it radiate spokes which support a periphery of good ideas. One of the best things Boston has ever done or ever proposed to do is that now announced—that the Boston Institute of Technology is to give a course of free instruction to pupils of both sexes in the art of making patterns for prints, delaines, silks, paper hangings, carpets, etc. Now let this idea be extended throughout the country and enlarged upon until our common schools, seminaries and colleges shall become so technical that pupils shall learn not only language, mathematics and the physical sciences in the abstract, but their application to, and *how to apply them* in the common duties of life. Then we shall have an educational system in this country worth boasting about.

An Illinois Agricultural Educational Convention is called to meet at Mendota, Ill., Oct. 24. It is to be representative, composed of members appointed by the Executive Boards of the several Agricultural County Societies—not more than three members from each county. The object announced is:—"After consideration and deliberation, make such judgment in the case as will promote home or industrial education, and, if need be, correct anything found in the curriculum of study, or the allowance of any teaching or practice that does or may conflict with the superior claims of the leading objects for which the institution (the Illinois Industrial University), was endowed."

THE SEASON, CROPS, PRICES, ETC.

Caledonia, Liv. Co., N. Y., Sept. 23.—The weather, for a week past, has been showery, following white frosts. The frosts did but little damage, being mostly confined to low situations. Corn fodder in such places was somewhat damaged; four-fifths of the corn on the uplands of this town is cut; on the Genesee flats large fields are still uncut, and the fodder is considerably damaged, while potatoes growing in the same fields are unharmed. As a whole, the corn crop of this vicinity is good. Oats and barley, I think, will prove an average crop. Wheat, the staple, below in yield and quality. Great hopes were had of fields that in May were bare and in June and July gathered a goodly amount of straw; but the growth was untimely, out of season, and such hopes and wheat were blighted by rust and midge. The weather for the wheat just sown has been ordinarily favorable. The first sown wheat grew rapidly; this was checked by a week of cool weather, that in turn is followed by a warm spell. Potatoes, so far, are good in quality and yield. Apples are plentiful and of good quality. Peaches are more plentiful than is usual for this vicinity. Grapes are rather late. My Delawares wintered the best, and put forth two weeks earlier than Dianas or Isabellas; they are well loaded and eatable, but not fully ripe. Last year they were gathered at this time. Many farmers are harvesting clover seed, which in this vicinity is apparently very well filled. The price of wheat (present crop) will vary more than usual. The present range for white is $1.50@1.75. The attention of farmers is gradually turning to stock. The increasing demand in the Rochester market has been marked for the past two years, and fat stock of all kinds (hogs excepted) return a better per centage than grain.—D. L.

Euclid, Onondaga Co., N. Y., Sept. 24.—Spring crops in this vicinity are good. Wheat one-half a crop; rye, two-thirds of a crop; hay, an average yield, of good quality; corn sound and well cared; potatoes fair, and late kinds still growing. No frost yet sufficient to injure vegetation. Tobacco was not planted as extensively as last year, but is a fine crop, of good quality and color, fully equal to the crop of 1870. The crop was of exceeding rapid growth, being generally harvested within two months after transplanting. Small fruits were abundant; apples, a small crop. Weather at present very warm. —T. H. S.

Hart's Falls, Rens. Co., N. Y., Sept. 23.—Corn crop good; potatoes half a crop; buckwheat, ditto; Oats were good; rye light; grass, fair average crop, but lodged badly. Fall very wet and unfavorable for putting in rye.—A. H. D.

THE RURAL'S FALL CAMPAIGN!

ANOTHER TRIAL TRIP!

NEW QUARTER—NEXT YEAR.

A SPLENDID PREMIUM!

THE RURAL NEW-YORKER is offered for the ensuing Three Months, from October to January, On Trial, for ONLY FIFTY CENTS; and for Fifteen Months—say from Oct. 1, 1872, to Jan. 1, 1874—for $3. This is giving Thirteen Numbers for Fifty Cents, and Sixty-Five Numbers for $3. To every person sending $3 for fifteen months, as above, or $5 for ten Trial Subscribers (from Oct. to Jan.) we will send as a Premium, postage paid, the Splendid Steel Engraving entitled

BIRTH-DAY MORNING,

OR THE GARDENER'S PRESENT.

Size 24x30—retail price $5. This beautiful engraving is illustrated (on a small scale) and described on page 193. Every non-subscriber to MOORE'S RURAL should note this announcement—and every subscriber can secure the picture by either obtaining ten Trial Subscribers, at 50 cents each, or subscribing for 15 months, (and selling or giving away the paper for the next three months, or until his present subscription expires.)

THIS RARE OFFER

Is worthy the attention and effort of every reader. The engraving is first class in every respect, and, if sold, would be worth at least $5 per copy; but copies are not for sale, and, as we own the plate, this beautiful and artistic Picture *can only be obtained by subscribing*, or procuring subscribers, as above stated.

Biographical.

COUNT SCLOPIS.

COUNT SCLOPIS, President of the late Geneva Tribunal of Arbitration between the American and English Governments, is a man of much note in his own country, being a jurisconsult of great repute, and who has been for several years President of the Italian Senate. The manner in which he has presided over the deliberations of the great international tribunal has met with cordial approval from all parties. The fact that he was chosen to preside is, of itself, a sufficient tribute to his ability and honor, and indicates the confidence all parties have in his judicial mind and executive ability. We give his portrait herewith, and regret that we have not the data at hand to give a more elaborate record of the past history of this man.

"A FELLOW BY THE NAME OF HOLMES."

THE following story is told concerning the late President LINCOLN:—"In 1845, 'ABE LINCOLN,' as he was then called, came to Bloomington, Ill., about sixty miles from his home in Springfield, to defend an aged father in a suit for slander brought by his son. The old man's spouse, a second wife, and not altogether saintly in the estimation of the step-son, had spoken severely of the step-son's wife, and he prosecuted for slander, as was supposed by some, more to get the old man's money than to keep peace in the family. They had gone through the evidence, and LINCOLN made the closing speech. As he approached the close, he called the father to his side before the jury, and spoke of the unnatural aspect there presented by a man of gray hairs defending himself against the conduct of his child. Raising his hand higher than that frosted head, he summoned the spirit of the departed mother to console the defendant in his unmerited sorrows; to shield him in these days when he needed some requital of affection from the assault of their thankless child. 'Her spirit of love is all that remains to him now,' said LINCOLN, 'for

> And the names he loved to hear
> Have been carved for many a year
> On the tomb.'"

"These lines fitted in like an exquisite piece of mechanism. The case was gained. A witness of the scene who reports the case says that at the close he asked:—'Mr. LINCOLN, who was the author of those lines you repeated?' 'Oh,' said he, 'it was a fellow by the name of HOLMES.'"

OLD UNCLE JAKE.

"OLD UNCLE JAKE," as he was called, a colored man, died at Albany, the other day, whose life during the rebellion was full of thrilling adventures and devotion to the Union. One dreary night in September, 1863, while a company of the Fourteenth Vermont infantry was on picket duty in a pine swamp near Newbern, N. C., Uncle Jake came into the lines at the risk of his life, to tell that a large force of rebels would gobble them up that night. On this information the company were deployed as skirmishers, and about midnight came in contact with the enemy, and drove them back in great astonishment, to find the Yankees ready to meet them. A few weeks later, the captain and two sergeants of the Vermont company were taken prisoners, and put in a boat to cross the bay. Uncle Jake, who was rowing, cut the cords that bound them, and they, with a desperate struggle, succeeded in overpowering their captors and making them prisoners. Later still, Uncle Jake went out to get his wife and children and bring them within the lines, when he was seized by the rebels, and tortured, to get some information of the Union forces. News was carried to the Union pickets, and a squad of cavalry went just in time to find the rebels in the act of stringing old Jake up to a tree, having failed to get any satisfaction from him. A short fight, and Jake was free again. These are only some of the incidents which would form a volume if written. The war closed, and Uncle Jake was brought North. His wife died at Boston, and his children scattered. Two years ago he came to Albany, and with a small boy went around gathering ashes from day to day, until a short time ago he sickened and died.

SOME OF THE SWEET SINGERS.

A WRITER recently wrote concerning the prima donna just now the New York sensation:—"LUCCA, like NILSSON, came of plebeian stock, but, unlike NILSSON, she has matured into lyric greatness by a slower and surer process. I know not what slaves of St. Cecilia hunt the peasant fields of Europe for these diamonds, but most of us know by what laborious process they are polished and set, and how inevitably they come, at last, to decorate a title with the radiance of their genius. The Baroness VON RHADEN sprang from obscurity in Vienna. It was in the Hof Theater that she was first discovered, a little imp only eight years old, whose cuties were to stand on her toes three hours every morning and let the ballet-master scold her. Her parents were miserably poor, and they were Jews. It seems strange now to tell of her pitiable sufferings in that theater, of the meanness of her attire, and the scoffs of her companions. But why should it seem strange when there are some of us who can remember when ADELINA PATTI ran barefoot over our free soil and carried beer for her master. Have we forgotten that but yesterday CHRISTINA NILSSON gathered fagots in the bleak sands of Smaland, as her forefathers, I know not for how many generations, did before her? Certainly, of all peoples, we are the least surprised at this—we who cannot stretch out a hand without coming in contact with genius and wealth, grown so fast that the muck of the sprouting place is not yet washed off by success.

COUNT SCLOPIS.

GUSTAVE DORE AT WORK.

A WRITER in Scribner's Monthly says:—"Not far away, in the Rue Bayard, day and night, works GUSTAVE DORE, now painting, now rapidly sketching in his great sketch books the designs which are to electrify the world. He is a little man, with dense black hair and ruddy complexion; with healthy chest and sinewy arms; and with a confiding, friendly manner, which at once wins everybody to him. His jet-black mustache shades clear-cut and firm lips, indexes to a character which has always held him above the level of the grosser Parisian temptations. His whole heart and soul are in his work. He has had lights specially prepared in his great rambling studio, so that he may paint when he desires; and at the very moment that his admirers are swallowing their night-cap cup of coffee, and stupidly gazing at the procession of painted beauties along the Boulevard des Italiens, he is sketching vigorously, or pacing up and down in the studio, overmastered by some new conception which he dare not yet confide to paper. Dore has a horror of the French passion for holidays, and once told a friend that his severest trial was on New Year's Day. 'It is not the money for the presents,' he said, 'but the time spent in this inane round of calls, which I give grudgingly.' When once you have passed the Cerberus who guards the gate of DORE'S paradise, you will thenceforth have free entrance. But the aforesaid Cerberus is of a decidedly suspicious and hostile turn of mind, and to the many, DORE is as inaccessible as was the milliner WORTH on one of his 'thought-days,' when he was devising costumes for the court ladies of the Second Empire."

ONE OF DICKENS' DAY DREAMS.

MR. DOLBY says of DICKENS:—"Going round by way of Lambeth, one afternoon in the early Summer of 1870, we had skirted the Thames along the Surry bank, had crossed the river higher up, and on our way back were returning at our leisure through Westminster, when, just as we were approaching the shadow of the old Abbey, at Poet's Corner, under the roof-beams of which he was so soon to be laid in his grave, with a rain of tears and flowers, he abruptly asked:—'What do you think would be the realization of one of my most cherished day dreams?' Adding, instantly, without waiting for any answer:—'To settle down now for the remainder of my life within easy distance of a great theater, in the direction of which I should hold supreme authority. It should be a house, of course, having a skilled and noble company, and one in every way magnificently appointed. The piece acted should be dealt with according to my pleasure, and touched up here and there in obedience to my own judgment; the players, as well as the plays, being absolutely under my command. There,' said he, laughingly, and in a glow at the mere fancy, 'that's my day dream!'"

WEBSTER STOPPING THE INTEREST.

DANIEL WEBSTER once dined with an old Boston merchant, and when they came to wine, a dusty old bottle was carefully decanted by Peter and passed to the host. Taking the bottle, he poured out Mr. Webster's glass and handed it to him. Then pouring out another for himself, he held it to the light and said:

"How do you like it, Mr. Webster?"

"I think it a fine specimen of old Port."

"Now, you can't guess what that cost me?" said the host.

"Surely not," said Mr. Webster. "I only know that it is excellent."

"Well, now, I can tell you, for I made a careful estimate the other day. When I add the interest to the first price, I find that it cost me the sum of just one dollar and twenty cents per glass!"

"Good gracious! you don't say so," said Mr. Webster; and then draining his glass he hastily presented it again with the remark:

"Fill up again as quick as you can, for I want to stop that confounded interest."

PERSONAL ITEMS.

HENRY M. SMITH, from 1854 to 1865 connected with the Democratic Press and Chicago Tribune, later and successively with the Chicago Republican, Advance, etc., resumes, Oct. 1, his old position as managing editor of the Chicago Tribune.

DR. ABEHEN, lately deceased, was the intimate companion and adviser of the Emperor WILLIAM and Prince BISMARCK during the late campaign in France; and because of his relations to the Prussian Premier, come to be known by the title of "Bismarck's Pen."

MRS. CHASE of New Hampton, N. H., braided 1300 palm leaf hats during the year ending July 4, besides doing her own household work. It would be interesting as an economic item, if we could add the amount she received for this work, but we cannot.

Our Story-Teller.

DEACON FUSTIC'S WIFE.

BY LAURA SOUTHGATE.

DEACON FUSTIC'S wife was an active Christian; she always rose at five o'clock in the morning, Summer or Winter, and before the rest of the world had fairly opened its eyes, she had not only set her housekeeping affairs in train, and planned out the Deacon's work for the day, but she had refreshed and wound up her soul, by a good, solid portion from the Bible and SCOTT'S Commentaries.

Now, on one particular morning Mrs. FUSTIC was up a little earlier than usual, and after administering a good, vigorous shake to the slumbering Deacon, and starting old HANNAH from her bed with a loud call, she gave such a tremendous rap on black PETER'S door, as caused his bones to jerk as though he had received a charge from a galvanic battery.

"Why, PETER, here it is near a'most five o'clock and you not up! Well, now, be brisk and get your chores done up, and the wagon ready to take me over to the Corners as soon as breakfast's over."

And so, after breakfast, while the Deacon placidly took his hoe for a little exercise round the flower-bed, Mrs. Deacon, his wife, started for the Corners with a big bundle carefully wrapped up, and also a basket containing bottles, and parcels of one sort and another. On they went, the Deacon's wife talking partly to PETER and partly to herself.

"There now, PETER, stop. I want to find out how old Mr. FLETZEL is."

The wife of "old Mr. FLETZEL" was already approaching the wagon, and Mrs. FUSTIC learned that the invalid was much better, that the medicine he had taken for the two or three days had worked wonders.

"Well, never you mind that medicine any more," said the Deacon's wife, in a tone that signified that nothing but compliance was to be thought of. "Here, you give him this that I've brought you; there, let me see; this is the bottle. Now, give him this three times a day, be sure. Come now, PETER, let's be getting along; I'm in a hurry."

A mile further they went, and then drew near a little, dilapidated, disheartened-looking house.

"Here, PETER, stop; I want to speak with SUSIE EVARTS."

"She as has lost her husband?" asked PETER.

"Yes; here she is coming out. Well, SUSIE, I hope you are pretty well—that is, as well as you can be."

"Pretty well, and I try to be cheerful," said SUSIE, beginning to cry. "I keep my heart up by thinking—by thinking how nice a little boy will be."

"Little boy! Now, SUSIE, that's just ridiculous! What in the world would you do with a boy? Oh, no; a little girl's better for you."

A shade of disappointment passed over SUSIE'S face. "The doctor has left some belladonna for me," she said.

"Bella-fool! Now, don't you take any such stuff as that. Here, I've brought you some boneset; now you steep it, and take a good bowlful before you go to bed at night; and don't have no fussing with queer medicines. Well, now, I must be going. SAM JAMES' wife is going to have a party to-night, and I want to lend her these curtains of mine."

Mrs. JAMES had risen early that morning, and now, as Mrs. FUSTIC drove up, she was perched on the standing-steps, putting up some freshly-done-up white muslin curtains at her parlor windows. The window was already finished, and Mrs. HOLMES, her next door neighbor, and HATTIE MARSTON, a bright-eyed girl of eighteen, were busily engaged adjusting the loops of cherry-colored ribbon.

"Oh, how lovely they make the whole room look," said HATTIE; "so airy and cheerful."

"I always did like white curtains," said Mrs. HOLMES, "and you never would know but these were new—the darns don't show a bit."

"Oh, dear!" exclaimed Mrs. JAMES, "here's Mrs. FUSTIC coming in the wagon."

"Well, now, I never!" said the Deacon's wife, coming in, bundle in hand. "Now, I declare, LETITIA, if you haven't had all your trouble for nothing; and I've hurried so to get here. But I suppose you've only pinned them up, so it won't be much to get them down. Here, I'm going to lend you these satin-damask ones of mine. I got them out yesterday, and had them all brushed. I haven't used them for several years. They are a little faded, but there isn't a spot on them; and dear me, when they were new they cost nigh a hundred dollars a window! Come, it won't take but a minute to take your'n right down."

Mrs. JAMES paused, and looked regretfully at the lovely transparent folds of her muslin curtains.

"Come, I'll help you," said the Deacon's wife.

"But, Mrs. FUSTIC, I think these will do, they are all up now."

"Why, no, it's no work at all to change them, and these of mine are a great deal more rich looking."

And, suiting the action to the word, Mrs. FUSTIC went at it, and in a remarkably short time

down came the muslin curtains and up went the heavy red ones.

"You needn't be afraid to use them just for one evening," continued this energetic spoke in the social wheel. "See how rich-looking they are. Yes, they cost nigh a hundred dollars a window!"

"And is this Miss MARSTON, who has come to take the school?" said Mrs. FUSTIC, turning round to the bright-eyed girl when her work was completed.

"Oh, yes," said Mrs. JAMES, "I forgot to introduce her."

"I suppose you begin the school right away; and where did you say, now, you were going to board?"

"I am going to board at Widow WILDER'S."

"At Widow WILDER'S! Oh, no, it won't do for you to board there. She can't accommodate but two boarders, and the new minister has gone there. You see every one would say you were after him if you went there. Let me see; there's Miss GOULD; I should think she might take you. Of course she can; she lives all alone in the house by herself. I'll stop and speak to her as I go along."

An instinctive sense of politeness checked the quick reply that rose to HATTIE MARSTON'S lips, and the opportunity to speak at all was lost, for Mrs. FUSTIC had sundry directions to give Mrs. JAMES; and then there were other folks in the village whose affairs it was necessary she should meddle with, so in a hurry she bustled herself off.

"Oh, dear!" said Mrs. JAMES, scarcely daring to speak till the wagon was fairly out of sight, "I really do like the white curtains best."

"I think I should have said something if I had been you," said HATTIE. "Let's pull those old horrid things right down now and put the others back."

"Oh my goodness! I never should dare," said Mrs. JAMES. "I never should dare in the world; why, Mrs. FUSTIC would be awful angry."

"Well, supposing she was, I just longed to speak my mind right out; what business was it of hers?"

"Well, it wouldn't do to offend Mrs. FUSTIC, I really shouldn't dare."

NEW HATTIE was a distant cousin of Mrs. JAMES, and was staying with her for a few days, till after the party, and she should find a place to board. Well, three hours after the Deacon's wife had taken her departure back came PETER. HATTIE had gone out on several little errands the party required.

"Mrs. FUSTIC has sent me, ma'am," said old PETER, "for the young lady's trunk; she told me to tell you that she had got a place for her along of Miss GOULD, and she thought, as you had no wagon, mebbe it would accommodate if I took the trunk over."

"Miss HATTIE is not here," said Mrs. JAMES.

"Well, mum, Mrs. FUSTIC has made all the 'rangements."

"Oh dear me!" said Mrs. JAMES to herself; "Mrs. FUSTIC will be awful offended if I don't send the trunk; what shall I do?"

Indignant, to be sure, was HATTIE, on her return, to find herself transported all but bodily. "That Mrs. FUSTIC'S a horrid, meddlesome old Mattie, and I shall just let her know! I shall just give her a piece of my mind."

"Oh, HATTIE! pray don't say a word; it will stir up the awfullest muss that ever was; do try and keep quiet; you can go, you know, to Miss GOULD'S, if you only stop there three days."

"What was that she had to say about the minister boarding at Mrs. WILDERS?"

Oh, yes, that's it; the new minister; he's young and real handsome, and she's afraid, you see, you'll be flirting with him."

"I've a great mind to, just to plague her, the old goose, only I can't bear ministers; not young ones, they are such conceited fools. Anyway, Mrs. FUSTIC needn't worry herself about me, I can tell her."

"Well, HATTIE, do promise me you'll keep quiet; if you say a word there's no knowing what mischief it will make."

Luckily the party was at hand to divert the wrath that was gathering in HATTIE MARSTON'S heart, and as merry a party it proved to be as could be desired. HATTIE found herself the belle of the evening, and, though one or two old batchelors pronounced her a flirt, everybody else, the young ladies and the minister included, said she was "real nice."

A week after this Miss HATTIE commenced her school, and just about this same time there came to the village, to spend the summer, a Mr. PEMBERTON and his daughter.

"A fine looking man," thought Mrs. Deacon FUSTIC, when she saw the PEMBERTONS in church the Sunday after their arrival, "and a very sweet looking girl is the daughter." It appeared these new comers had a previous acquaintance with EDWARD LEE, the minister, and now, when the congregation were departing, they stopped for a moment's conversation with him. And what a sense of propriety and fitness filled the mind of the Deacon's wife as she saw her pet, the minister, standing by the side of the fashionably-dressed IDA PEMBERTON. She herself waited to be introduced to the strangers, and inwardly resolved that as speedily as possible she should make a tea-party for them. Indeed, this active Christian quite cast into the future, and felt that she saw before her exactly the one heaven designed for EDWARD LEE. And so, in a happy state of heavenly mindedness and earthly complacency she pursued her way homeward. But oh! unhappily for her heavenly mindedness, what should she see but HATTIE MARSTON walking with WILL BENNET, the wildest young fellow in the village. Here, now, was work to be attended to, and before the next day was far advanced the wagon and PETER and the Deacon's wife appeared before the door of the school house.

"Now Miss MARSTON," she said, when the teacher was called out, "you see how I've come just to say one word; you know, now, you are young, and you need some one to keep an eye on you; you see it won't do for you to be keeping company with young men; folks will talk about you if you do; I don't say that there'll be objection to your having society; there won't be none; perhaps I'll come myself sometime, and take you to the Dorcas meeting; but you see it won't do for you to be walking and riding here and there with young men."

"Mrs. FUSTIC," said HATTIE, her face growing red with anger, and her whole frame quivering with excitement, "what do you mean, coming here and speaking in this way to me? What do you mean? You are a—a meddlesome old thing! What do you mean? I should like to know." Stronger and more fluent came HATTIE'S words, and long and dreadful was the talk, but at last the enemy was beaten off the field, and HATTIE, flushed and irritated, returned to her school.

A great commotion this affair made for a while, but time passed along, and Mrs. FUSTIC went about in her wagon, and still the pretty little school mistress taught her scholars.

The tea party had been at the Deacon's house, and on the occasion the Deacon's wife had been delighted beyond measure at seeing EDWARD LEE all devotion to IDA PEMBERTON. Indeed, they conversed together nearly the whole evening in a low tone, and in a sort of confidential way that was truly beautiful to see. Mrs. FUSTIC felt she had done such an excellent thing in bringing them together, for, she said to herself, "they are just made for one another."

But, again, a disquietness of soul was in store for this actively benevolent woman. She chanced to peep out of her front parlor window one evening, as the Summer was drawing to a close, and there was that huzzy of a school mistress walking with the PEMBERTONS, and the minister along with them.

"I never, now," she said aloud; "I do believe that sassy gal is trying to get old Mr. PEMBERTON. Well I do declare!" and for the remainder of the evening Mrs. FUSTIC did nothing but declare and shake her head.

But now it was rumored, indeed it was "certainly true" that EDWARD LEE and IDA PEMBERTON were engaged to be married.

"And they do say, Mrs. FUSTIC, its coming off very soon," said little Mrs. BIRCH; "Miss PEMBERTON'S having an awful lot of sewing done, and next week she's going to the city to buy things, and then after that she's engaged three dress makers. But I must say as Mr. LEE isn't a courtin' very hard, leastways he don't come every night; Miss MASON as they board with ought to know, and she says he never comes but twice a week; but he looks as tickled as a peacock with new feathers."

Mrs. FUSTIC had been considering for some time what would be a suitable present for her to send the minister's bride, so soon to be; and that very day she sent to her nephew in the city, desiring him to purchase and send by express the handsomest cake basket he could find.

Duly, by express, came a box containing the elegant basket. Beautiful it was, and the Deacon and Mrs. FUSTIC, together with HANNAH and PETER, quite exhausted the language in expressing their admiration. But at last Mrs. FUSTIC wrapped it up, and partly to see how the same would look written, and partly because, as she said, she might herself die, "life was so uncertain," she wrote "Mrs. EDWARD LEE" on the outside.

And truly, as Mrs. FUSTIC said, life is uncertain; in three days from that time she was laid on a sick bed. A slow, wasting fever was consuming her life. MARTHA, her niece, came to take care of her, for the woman lately so strong and stirring, was growing daily worse and worse, till she lay unconscious at the very door of death, so low that life seemed just passing away. But breath remained, and the crisis was passed, and blessed sleep brought a little refreshment. Still, for days, low and weak, but docile and grateful, lay the woman by nature so self willed.

At last, one day, she opened her eyes wearily. "MARTHA," she said, "how long I have been sick; it seems so very long; has anything happened in the village; what's become of the PEMBERTONS?"

"Oh, yes, Auntie," MARTHA replied, "a great deal has happened, Miss PEMBERTON is married, and Mr. LEE."

"Married! Oh, well, I couldn't really expect them to wait because I was sick."

"Tomorrow, Auntie, I will tell you about everything, but you are too weak to-day."

"MARTHA," said the sick woman, after a pause, "there's a package in my lower drawer for the minister's wife, and I feel impatient to have it go; please, dear, send it."

The cake basket went to Mrs. EDWARD LEE, and the next day a smiling little bride begged to see poor dear Mrs. FUSTIC, just a moment, and the Deacon's wife entreated MARTHA in the tone of a little child that she might see her sweet pet, if it was only for a minute.

And in came HATTIE, bright-eyed as ever.

"I thought—I thought," said Mrs. FUSTIC, looking frightened, "it was the bride, the minister's wife, who was coming."

"Yes, dear Mrs. FUSTIC, you know we were married two weeks ago."

"I did not understand," said the sick woman. "I have made a mistake, I mean—I mean—I don't mean you know I am sorry."

"And you did not know I was going to be married? Ah, but you have been sick so long;" and the tears came in HATTIE'S eyes, as she knelt by the bedside, and took one of the pale thin hands in her own.

"And they told me Miss PEMBERTON was married!"

"Oh, yes; she was married the day before I was. You know she has been engaged so long to FRANK ASHLEY. He was a classmate of EDWARD'S, and when she came here, and found that EDWARD and FRANK were friends, she was so delighted. And we are so glad, dear Mrs. FUSTIC, that you are getting better," and HATTIE pressed the weak hand, and kissed the pale cheek. "But I must not stay and tire you today; I shall come again, soon, you know."

"Will you—will you?" Mrs. FUSTIC could scarcely speak with emotion, but faintly she said, "GOD bless you, my dear child."

HE KNEW HIM LIKE A BOOK.

THIS story comes from Bangor, Me.:—Near Bangor, in a little village, there dwelt, many years gone by, a lay member, who kept week days a country store, and on Sundays he would preach or exhort around among the neighboring towns, where he could find a vacant pulpit.

He was a man of lumber tongue, and could sell Yankee notions and preach the Gospel very handy.

It was his way to load up a wagon and peddle all through the country, leaving his store in the charge of his wife during his absence.

Finding himself, late in the week, upon a certain time, too far from home to get back, and having sold out his load, which at that time consisted of dried apples, which, by the way, were a little wormy, he gave notice that he would preach the next day, which was Sunday, to the people.

Many gathered to hear him. His text was; "And by their fruits ye shall know them." He handled this subject in his usual gallant manner, and, closing up his sermon with a glittering paragraph, he repeated the text. "Yes, my friends, and by their fruits ye shall know them."

Just at this point up jumped a retail grocer in the place, who had dealt with the exhorter the night before, and said, loud enough to be heard if the church had been twice as large:—"Yes, friend, *and by the worms in their dried apples, too.*"

BADLY MIXED.

"WHAT'S the matter, Bob?"

"Sam, who am I?"

"Why, you are yourself, Bob Harrison, ain't you?"

"No, far from it."

"Why, what's the matter?"

"Well, sir, I'm so mixed up, I don't know who I am."

"Don't take it so hard to heart."

"I ain't; I'm taking it in my handkerchief."

"Well, sir, what's the matter?"

"Why, I am married."

"Married? ha! ha! ha! why, sir, you should be happy."

"Yes, but I ain't."

"Why, all married men are supposed to be happy."

"Yes, but how many are so?"

"Well, sir, as I said before, don't take it so hard—tell us all about it."

"Well, Sam, I'll tell you how it is. You see I married a widder, and this widder had a daughter."

"Oh yes! I see how it is. You have been making love to this daughter."

"No! worse than that. You see my father was a widower, and he married this daughter, so that makes my father my son-in-law, don't it? Well, don't you see how I am mixed up?"

"Well, sir, is that all?"

"No, I only wish it was. Don't you see my stepdaughter is my stepmother, ain't she? Well, then, her mother is my grandmother, ain't she? Well, I am married to her, ain't I? So that makes me my own grandfather, doesn't it?"

SOCIAL SPLINTERS.

A FEW Sundays since a teacher in a Sunday school in Chicago said to one of her pupils, "James, what good thing—what great pleasure are you willing to give up as a sacrifice during Lenten season?" Jiminy meditated about ten seconds and responded, "I think I'll give up going to Sunday school."

How often we feel and act as if our mood were the atmosphere of the world! It may be a cold frost within us while our friend is in a glow of summer's sunset, and we call him unsympathetic and unfeeling.

IT is no disgrace not to be able to do everything, but to undertake or pretend to do what you are not made for, is not only shameful, but extremely troublesome and vexatious.

THERE are some people who see in so mentally and spiritually sluggish that one is reminded of the Irishman's remark, upon watching the squirmings of a turtle that he had decapitated:—"AV course he's dead, but the poor craythur is not sensible ut' it."

A WISCONSIN man has at last discovered some use for the peacock. The ornamental ornithological idiot will actually eat potato bugs.

Sabbath Reading.

THE PEACHES.

WHEN Summer flowers begin to fade,
And Summer leaves begin to fall,
One here, one there: in juicy strength,
The peaches redden on the wall.
And so, indeed, hot youth being past,
Our lives should show their fruit full fast.

The peaches redden on the wall,
Hiding in hollow cells of green,
Where plaited leaves hang thick about,
And scarce permit them to be seen.
And so, in truth, good deeds should be
Concealed in sweet humility.

The peaches redden on the wall,
Close set upon low branching trees;
And any hand may easy touch
The gifts the eye so easy sees.
And so with us, 'tis well for each
To keep within the other's reach.

The peaches redden on the wall:
They take the kisses of the sun,
The joy tears of the flying cloud,
The darkness when the day is done.
And thus, well used, the changing hour
Will help us to a larger power.

The peaches redden on the wall,
To drop when chilly winds shall blow;
But careful hands are swift to stay
Their fragrant lives from ending so.
And surely thus a Hand will save
The good from falling in the grave.

The peaches redden on the wall—
But look up higher overhead,
Where all the vastness of the sky
With faintest, calmest blue is spread.
And what is that from where we stand
But blue mist hiding Fatherland?

The peaches redden on the wall,
Though night's dark curtain drips with dew;
The white stars show themselves, and shine
Through rounded cloud and hovering blue.
And oh, to feel "past fruit and tree,
The Lights of Home shine forth for me!"

AMBITION TO DO GOOD RIGHTLY DIRECTED.

AMBITION is one of the pervading and absorbing elements of the human heart. It governs the actions and deeds of men—sometimes for good, oftener for evil. To the intelligent observer the rise and fall of nations illustrates it. While carefully perusing the pages of history, with its bewildering and fascinating details—so truthfully and impartially presented—the reader is made aware that ambition, unrestrained, has been the principal aim of the heroes of the past. Little did they heed the sufferings they occasioned—little did they care for the destruction of life or the desolated homes—if only they grasped the long coveted prize and stamped their names among the great of the earth.

History occasionally presents noble and commanding characters whose example and lives would be well to imitate, as it sheds a bright light through the darkness and gloom of ages, serving as a thread to lead some troubled THESEUS out of the tangled labyrinth of error and wrong, but often the contrary. The heart is fraught with many conflicting emotions; it is deceitful above all things; most imagine it far greater in taking a city than subduing and governing the desires and inspirations of an impure heart.

What else but ambition actuated ALEXANDER when he marshaled his armies, invading Persia, Egypt, India and other countries, becoming master? What else but ambition controlled him when he founded a city as a monument to this greatness? His was a brilliant mind, yet selfishness was plainly evinced when his teacher, ARISTOTLE, published his works.

What but the glory of renown plunged PETER THE GREAT into years of war—squandering the great wealth his father had accumulated—leading a life of hardship encompassed with many dangers and misfortunes.

Ambition, unless governed by religion or religious principles, brings sorrow, suffering and misery to many. Let it be *our* ambition to seek that peace and joy which a pure life affords. Although obscure and unknown, yet it is possible to attain greater happiness in doing whatsoever our hand findeth to do—than they who aspire after the perishing honors of this world. Let us crown our brows with the laurels of good deeds, kind actions, cheerful, contented hearts, remembering that, "Godliness with contentment is great gain." A. H. R.

DRESS PLAINLY.

SOME one has given the following reasons why people should dress plainly on Sunday. These reasons are as valid any other day in the week. Here they are:

1. It would lessen the burden of many who now find it hard to maintain their places in society.
2. It would lessen the force of the temptations which often lead men to barter honor and honesty for display.
3. If there was less strife in dress at church, people in moderate circumstances would be more inclined to attend.
4. Universal moderation in dress at church would improve the worship by the removal of many wandering thoughts.
5. It would enable all classes of people to attend church in untavorable weather.
6. It would lessen, on the part of the rich, the temptation to vanity.
7. It would lessen, on the part of the poor, the temptation to be envious and malicious.
8. It would save valuable time on the Sabbath.
9. It would relieve our means from a serious pressure, and thus enable us to do more for good enterprises.

Ladies' Port-Folio.

CUPID DEFIANT.

SMALL rebel, such as passing well
Might for some angry Cupid stand
By Fancy caught from some dear shell,
Carved by some wondrous Attic hand;
Dear baby wrath, sweet infant scorn,
Oh, Memory, hoard that picture still,
That stormy grief of beauty born
Our thoughts with tenderest smiles to fill.

O, little feet that stamp, dear cries
That love above to peace should woo,
Had you but met Anacreon's eyes,
How song divine had treasured you!
As some fond amber might enfold
Some gentle thing from death and harm,
So, in his song's pellucid gold,
Had you been caught, all years to charm.

Or had our mighty Shakspeare seen
That pretty anger it had seemed,
A dainty sweetness to have been
Hived in the elfin dream he dreamed.
Then, with Titania's moonlit self,
For ever had our fay lived on
In midnight revel with each elf
That glads the Court of Oberon.

[W. C. Bennett.

"COUNTRY WOMEN."

BY ELISE.

"CAYUGA" has evidently relieved himself. I say *himself*, for certainly no one but a man, and one of very broad habits of thought and observation could express himself so liberally in regard to work—in view of the wonderful sacrifices he is obliged to make daily, by, reason of tired women.

What sympathy! what encouragement he offers to us—poor farmers' wives and daughters! Being one of the latter myself, and having been born and brought up on a farm where all the work of boarding the men necessary to cultivate over three hundred acres was performed by the family for more than twenty years, I assume to to know more, perhaps, of what he affirms than he does himself. He has merely stated our faults and grievances, but has suggested nothing for our relief.

As one of "the young ladies of a family," I acknowledge myself guilty of the sins of "crocheting," "playing croquet," drumming on the piano, reading a little Latin, German, or French, occasionally, and scribbling considerable, besides keeping up with the current literature and news of the day. I also confess my ability get a meal on the table in good time and order; to do washing, ironing, baking, cleaning, sewing, and knitting; to teach, or to write in an office; also to enjoy riding, walking, visiting, and entertaining my friends. For all of which I am truly penitent. And I am just one of those 'common country people."

I would not have "Cayuga" understand that I really *do* all these things every day, but that I have done, and am able to do them, *all well*. I am not afraid to work, neither am I ashamed to work; nor would I educate a child with a hatred for it, or in idleness; but I must admit that I sometimes get tired of this "puttering" about. BRIDGET'S shadow has never crossed our threshold—only, however, because she is a luxury (?) we cannot quite yet afford.

I consider it better economy for our farmers' wives to hire BRIDGET—who has inherited an iron constitution—to do the work of the kitchen, under intelligent direction, than to wear themselves out in "unappreciated" toil, and lay by that two dollars per week. For no woman, living on a farm, can go on—year after year—doing all the work which his mother, and nearly all our mothers and grandmothers did, in those good old-fashioned days, without such a wearing on the physical system, as well as the mental, as will wholly unfit her for the intellectual training of her children.

I hold that physical and intellectual culture should be developed side by side; that they must go hand in hand through life, if individual happiness is to be attained. Constant drudgery insures constant weariness; and without the relaxation afforded by literary or musical pursuits and out-door amusements, we become absorbed in a dull, stupid routine of work, which renders our society a bore to our friends, and finally drifts us into that desponding, complaining frame of mind which has no hope but that of *rest*, sometime, in the grave, and which our friend so deprecates. I am not surprised that such discerning men as "Cayuga" get out of patience with "a woman who will run all day in a half bushel."

Now, my work is always *done*. If a friend calls, I have abundant time to sit down and chat. If the horse and carriage are at liberty there is nothing to prevent my taking a drive—long or short, according to inclination. But, one says:—"How is that? with all your work, I don't understand how you can leave at any moment, for a visit or a drive."

Simply because I think it is my *first* duty. I consider it quite genteel to be healthy, and, consequently, like to ride or walk in the open air as much as possible, and, if when I return my time for household duties is limited, the vigor and freshness acquired out-of doors enable me to work more rapidly and cheerfully than if I had been plodding in the kitchen the whole of that time. Attention to the laws of health is the primary duty of every woman.

Again, "Cayuga" recognizes no progression in the tastes and habits of country people. He would have them remain on a dead level. I have heard, before, of our "grandmother's days." I would urge him to come out from his seclusion into the world, and learn, by actual observation, that farming is not necessarily drudgery; that farmers' wives and daughters appreciate the luxuries and refinements of life, and that this is no indication of idleness or of mock gentility. On the contrary, some of our most intelligent, refined and highly educated farmers' wives are exceedingly industrious, energetic women.

Furthermore, there are *few* ladies of my acquaintance who prefer a delicacy and feebleness of constitution to strong, robust health. Most of them would be thankful if their mothers had toiled less and rested more, and so have kept themselves innocent of the sin of transmitting to their children a weak, tired, physical organism. To such Cayuga's homily is comforting to the last degree, and, probably, after reading and re-reading it, in a vain search for the implied sarcasm, they arrive at the very flattering conclusion that the writer is either wilfully ignorant or demented, or else has lived his life, hitherto, in a six-story, seven-by-nine tenement room in the city.

HUSBANDS, READ AND HEED!

WHY is it that husbands with wives who love them—whose first care, after duty to GOD, is to make them happy—wives who strive to make themselves, intellectually, worthy companions for the husbands they admire and respect, as well as love—whose highest ambition is to be true, Christian companions—why is it that these husbands, otherwise kind and affectionate, will, night after night, leave their homes, to seek the companionship of indifferent men in town, there coldly discussing elections, etc., until twelve, one, two, three, yes, four o'clock in the morning, selfishly defrauding their wives of one of their holiest, most sacred rights?

O, could these husbands but see into the hearts of those they hold dearest; see the anxiety with which they watch for their coming as night draws near; the cruel suspense as hour after hour passes by, and no husband yet, until, finally, too sad for companionship with others, they seek their rooms, each there to ponder, again and again, "Why, why is it that I have not the attractions to call him home?" Could he thus see into her heart, would he so fill it with anguish for the husks of pleasure that he finds in town?

Is it a wonder that some women—yes, loving, affectionate wives—so cheated of their domestic happiness, should seek to indemnify themselves with the glittering promises of "Woman's Rightsism?" Others, keeping true to GOD-given principles, strive by affectionate remonstrances to win their husbands to them.

Husbands, you hold the power, while we, your wives, your truest friends, can only plead and pray. May GOD hear my prayer, that he for whom this is written will read, feel, and amend.

F.

WOMEN PERSONALS.

MRS. MERRIMAN, who has just been married to Father HYACINTHE in London, is a brilliant and handsome American widow, the daughter of a Mr. BUTTERFIELD, of Bucyrus, Ohio. She has a son of some sixteen years of age, by her first husband, who was a merchant in Bucyrus. At one time she was a devout member of H. W. BEECHER'S church, but was converted to the Catholic faith by the preaching of Pere HYACINTHE, at Notre Dame, in Paris, where she was acting as American correspondent for a number of newspapers.

MISS JANE STUART, the daughter of GILBERT STUART, is in Boston, making copies of some of her father's portraits. She is said to copy his pictures with wonderful exactness, having made an especial study of his style; but she has copied also, with decided success, portraits by other artists. She lives in Newport, but is in New York for the present in order to make copies of valuable portraits which are owned here.

MISS SADONE KARNELL of Little Compton, R. I., is *en route* for Omaha on foot. At last accounts she was at Terre Haute, Ind., in good condition.

FEMININE FELICITIES.

A LAWER riding through the town of Worcester stopped at a cottage to inquire his way. The lady of the house told him he must keep on straight for some time, then turn to the right; but said that she herself was going to pass the road that he must take, and if he could wait a few moments till she could get her horse ready, she would show him the way. "Well, said he "bad company is better than none—make haste." After jogging on five or six miles, the gentleman asked if he had not come to the road he must take. "Oh, yes," she said, "we have passed it two or three miles back; but I thought bad company was better than none, so I kept you along with me."

"Do you execute this deed without any fear or compulsion of your husband?" asked a commissioner of deeds of a woman whose acknowledgement of a deed he was taking. "Fear of my husband!" exclaimed the irate lady. "He—compel—me! You're a fool!" And she swept indignantly from the commissioner's office.

THERE are six ordained women pastors in the Universalist Church in the United States. This is the only church which admits women to ordination.

"HUSBAND, I must have some change to-day." "Well, stay at home and take care of the children; that will be change enough."

Reading for the Young.

THE PEACH.

BY GEO. W. BUNGAY.

ON its soft cheek the sun did shine,
And turned its water into wine;
And he who drinks the wine shall be
Glad as the guests of Galilee.

O luscious orb, so sweet and soft,
Tinged with the light that beams aloft;
The blended hues of red and gold
Are like the hues in heaven enrolled.

A sunny half the world can boast,
A better half—has man to—toast,
A higher half—the soul can reach—
A rosy half the ripened peach.

SELLING BOYS AND GIRLS.

CHILDREN, here is a story written by a correspondent at Hong Kong, China, which reveals to you how boys and girls are used there. It will interest you, and perhaps make you more thankful and contented than you are. The correspondent says:

I saw the sale of a family, last week, for debt, where the husband and father was in California, and perhaps I cannot do better than to tell you about it. There were five children—three girls and two boys. We had passed them three times in our chairs during the day, as they stood beside the road, dressed in their holiday attire of black. The silence they observed whenever any person passed, and their downcast looks, created curiosity on our part to know their business there. Arr Hung (our writer) was called up and asked the cause of this little parade. "Why," said he, "the girls, and perhaps the whole family, are for sale." We stopped our chairs and stepped out to have a talk with them, using Arr Hung as an interpreter. The mother was wrinkled and gray, and hung her head, as if she were afraid to look us in the face. But the children, with the exception of the oldest girl, looked cheerful, and were quite pleased with their holiday attire. The oldest girl was sixteen, and the oldest boy fifteen. So said the gruff old broker who had the party in charge, who seemed quite anxious to dispose of his wares.

After a good deal of quizzing and evasive answers the broker told us that the husband and father was in California, and had neglected to pay his note given for his passage, and that his family were now offered for sale to pay the debt. He hoped to be able to pay the debt with the sale of the two oldest girls, but as yet he had received no offers. He said that the family became security, voluntarily, and he never knew of a case where they did not voluntarily offer themselves for sale if the note they secured was not paid. In reply to our questions he said that when a customer bought a child or person, the person was made at once the owner of the child, body and soul. No Chinaman would dispute the purchaser's right to do whatsoever he pleases with the human being he had paid for. The boys would make good servants, he said, and in the course of a few years be worth a fortune to the owner. The girls would make good "amers" (or nurses, as they are called in America). He would show us their physical beauty—would make them sing and play tricks if we thought of buying. How much would we give? The oldest girl he would sell for four hundred dollars; the next one for two hundred, the little six-year-old for fifty. The boys he could not sell until the girls were disposed of. We thought the price too high. The market was glutted with salable girls, and he must not think of getting over one hundred for the oldest and handsomest, while for the little one he must not expect ten dollars. He sneered at that, and said that Englishmen always talked that way when they wanted to buy.

While we were conversing a party of blue-robed Chinese aristocrats came up and began to inspect the family. They opened the mouth of the oldest girl, rapped on her white teeth to see if they were sound, pulled open her dress, thumped her ribs, laughed at her little feet, told her to show the whites of her eyes, ordered her to sing and to show them the trinkets which the fond mother had given her as a parting gift. All the while the salesman kept up a constant jabber, in which we took no interest. Time pressing, we passed on, leaving the parties disputing about the price and discussing probabilities of their running away if taken to Hong Kong. After making our call we returned the same way, to ascertain the result of the sale. Only the mother and the boys were left. The debt was only $300, and $50 of it still remained unpaid. I have been often told by residents in China that the parents would as soon sell their children as a cow or a pig. And I had begun to believe that such was the case upon passing the group the first time. But the scene had changed. The girls were gone, and now a boy must go also. The mother sat in the dirt with her arms around the youngest, wailing in the most piteous manner, and as Arr Hung said, cursing the men that sold her husband a ticket to America at $600, which cost them but $40.

The broker sat listlessly by, smoking his pipe, and twirling his cane, looking as if it was the smallest matter of business with him. The boys were crying, and seemed very much afraid of us now it was certain that one of them must go. But we passed on and left them in their misery. We never knew whether the boy was sold to a childless man to be treated as a son, to a Portuguese to be carried to the West Indies under a nominal contract, or to a native land owner to be his slave. But that one of them was sold into servitude for the sum of $50, there can be no doubt. The girls were doubtless purchased for the vilest of purposes, unless they had the rare luck to fall into the hands of some native in search of a legitimate wife. I am told that the price of girls has gone up within a few months, owing, perhaps, to the fact that a less number of emigrants have forfeited their bonds in California than was the case six months ago. I was shown four bright, plump, rose appearing girls, yesterday, who were purchased less than a year ago (the whole lot) for $80. Now they will sell readily for $300 each.

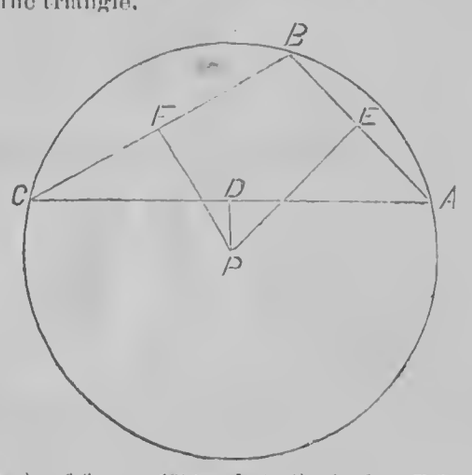
PROBLEM.—No. 4.

FROM a point without a triangle, equally distant from all of its angles, perpendiculars are drawn to the three sides, which measure respectively 3, 8 and 10 rods. Required, the sides of the triangle.



Scale of figure, 13⅓ rods to the inch. E P= 10 rods; F P=8 rods; D P=3 rods.

B. F. BURLESON.

☞ Answer in two weeks.

PUZZLE.—No. 6.

MY first, third and fourth are a Spanish lady's wrapper; my second and third make a musical sound; leave off my last, and I'll pass for a French coin; my third and fourth are a useful artical in England; my second, third and fourth are sometimes used in a flight. My whole is a monument of changed fortunes. What is it?

☞ Answer in two weeks.

GEOGRAPHICAL ENIGMA.—No. 1.

I AM composed of 42 letters:

My 1, 33, 9, 23, 6 is an island in Long Island Sound.
My 10, 40, 7, 20, 24, 36, 13, 17, 12, 22, 19 is a cape on the Western coast of the United States.
My 5, 9, 31 is a river in Europe.
My 36, 17, 4, 13 is a mountain in Italy.
My 18, 3, 39, 17, 6, 8 is an island belonging to Occanica.
My 37, 34, 13, 31, 1, 18 is a county in New York.
My 11, 25, 30, 16, 3, 7, 40 is a city in the United States.
My 25, 26, 14, 4 is a cape in one of the divisions of the Western Hemisphere.
My 32, 37, 29, 12, 6 is a lake in Ireland.
My 38, 14, 15, 4, 35, 22 is a grand division of Europe.
My 23, 17, 42, 33, 11, 30, 39 is a bay in Mississippi.
My 32, 28, 40, 2, 21, 5, 13 is one of the United States.
My 23, 15, 27, 21, 31, 35 is a county in Arkansas.
My whole is a grand maxim.

Saratoga, Wis. LIBBIE M. LINDSEY.

News of the Week.

CURRENT TOPICS.

Death of Rev. Peter Cartwright.

PETER CARTWRIGHT, the pioneer Methodist of Illinois died at his home near Pleasant Plains, Sangamon county, Ill., Sept. 25, 1872. At the time of his death he was the oldest ordained member of the Methodist Church in the United States, having been in the ministry over sixty years, dying at the age of eighty-seven. He was born Sept. 1, 1785, in Amherst County, Va. Soon after the United Colonies gained their independence his family removed to Logan Co., Ky. In 1801 he was converted, and in 1802 he was formally permitted to "exercise his gifts" as an exhorter. In 1806, he was ordained a deacon by Bishop Asbury; August 18, 1808, he married Frances Gaines. In October, 1808, he was ordained Elder by Bishop McKendree. In 1824 he removed to Illinois, where he has since resided. He was once elected to the Illinois Legislature, took an active part in politics, opposed Abraham Lincoln when he ran for Congress, but has always been devoted to the Methodist Church.

The Arraignment of the People.

ONE of the most humiliating features of the present political campaign is that in which the people are charged by political partisans with being corrupt—with being in the market for sale to the highest bidder! Each party charges the other with spending an awful lot of money to carry the election; each asserts if the other party wins it will be because that other party has had the most money, or has spent the most, to pay for votes or to induce the people to stay away from the polls. Are the people then so corrupt? If they are, is it wonderful that their representatives are corrupt? Such statements, when publicly made, ought to be crammed down the throats of men who utter them with a mop; or the people who are thus arraigned ought forever after to hold their peace with reference to official corruption. Officers come from, are elected by, and represent the people in this country, and such statements are indictments of venality against the people.

Emigrants as Steerage Passengers.

THE daily papers have sent reporters to Europe who engaged steerage passage on some of the first-class steamers with a view of experiencing the kindness and consideration to which this class of passengers are subject. The story is told in detail; but it may be summed up in the statement that the treatment emigrants receive on board the best steamers of the best lines is simply outrageous and disgraceful, not to say brutal. That men and women will brave the discomforts and perils of such a passage to reach this country proves their ignorance of what they must endure, or their willingness to endure it in order to escape from the thralldom society casts about them in the Old World to the freedom of the New.

What is Napoleon Doing?

A BERLIN telegram, dated Sept. 25th, says the German Government have stopped the transmission by telegraph of a cipher dispatch of four hundred words signed by Napoleon. This will scarcely prevent Napoleon communicating with whomever he will; but it illustrates the nervousness and distrust which his name occasions among existing governments in Europe.

NORTHERN PACIFIC RAILWAY.

GEN. GEO. W. CASS, the new President, with a number of the directors, has gone to the Western terminus of the Northern Pacific Railway, to make a personal inspection of the work, and thus aid, intelligently, in its completion. This is a wise step, which will give confidence. The road has passed its crisis, and is rapidly stretching across the continent. Over 500 miles are now completed, connecting with steamers on the Upper Missouri, creating the best route to Montana. The line from Columbia River to Puget Sound, 75 miles, is nearly completed. The company now owns the property of the Oregon Steam Navigation Co., which controls the waters of the Columbia River, to the head of navigation, giving them a line of steam transportation 400 miles in length. All of this will pay to operate within the next year. During the coming year the company will build 250 miles East from Wallala, and an equal distance West from the Missouri River to the Yellowstone Valley, which will leave only 500 miles through Montana, to complete this great road.

Large numbers of emigrants are settling on the company's lands, and branch roads are being built, leading into British America. The road will also be tapped from the South by the roads leading to St. Paul. During the coming season the company will be able to give transportation over 1,000 miles of line. All connected with the work manifest enthusiasm for its completion.

SEMI-BUSINESS PARAGRAPHS.

Merit is Its Own Success.—Superior merits and capabilities, cheapness in price, and ease of operation, have placed the New Wilson Under-Feed Sewing Machine far in advance of all other machines in the market. The public shows its approval of all that it is and does by purchasing the machines as fast as the Company can possibly manufacture them. There is no test of a sewing machine ever yet inaugurated but what has been used on the Improved Wilson, and in every case it has come off ahead of every other machine in use. No pains or expense is spared in the material used in it, or the workmanship of its construction, to make the Wilson every way the best and most pleasant, and most durable sewing machine in existence. It costs but $50, and is sold on easy payments. Salesroom at 707 Broadway, New York, and in all other cities in the United States. The Company want agents in country towns.

Watch No. 12012, Stem Winder—bearing Trade Mark "United States Watch Co., Marion, N. J."—manufactured by the United States Watch Co. (Giles, Wales & Co.), has been carried by me five months; its total variation from mean time being only twelve seconds.—GEO. LOVIS, Gen'l Eastern Passenger Agent, Toledo, Wabash & Western Railway.

The Engineering (London) of December 15, 1871, publishes the report of W. M. Tresca to the *Societe d' Encouragement* on "Tin-Lined Lead Pipe," from which we extract as follows: "Architects and proprietors have largely adopted the lining for service pipes, and it is generally admitted that this lining removes all danger from the dissolution of the lead, and its consequent sanitary dangers."

Facts for the Ladies.—Mrs. M. J. Monroe, New York, has used her Wheeler & Wilson Lock-Stitch Machine since 1858 on family sewing and general manufacture; has tried others, but would rather pay $500 for it than use any other machine; it is as good now as when bought. See the new Improvements and Woods' Lock-Stitch Ripper.

A Rare Chance for Dairymen and Capitalists—1,000 Acre Farm for Sale.—Springwater Farm, consisting of 1,000 acres, situated at Scugog Island, Ontario Co., Canada, three miles from Port Perry. For terms, see advertisement of WM. S. SEXTON, on page 230, this paper.

Advice.—Send for free Price List. JONES SCALE WORKS, Binghamton, N. Y.

THE MARKETS.

MONEY AND TRADE AFFAIRS.

NEW YORK, Monday, Sept. 30, 1872.

THERE was continued excitement in Wall Street through the past week, though less in Money affairs than on the Stock Exchange. The speculation in Erie and Pacific Mail Stocks was extremely spirited, and the results against the bearish clique who have been operating heavily on the *short* side of those and other Stocks. Both Stocks were practically cornered, or made so difficult to buy, even at the advance, as to compel large private settlements on Erie Stock and to force the party to pay an advance of 6@8 per cent. for Pacific in order to cover their contracts. The feeling in the New York and Western Roads, generally, was better at the close of the week than on our previous report.

In the general Fall trade of the city there is not much falling off, although a less business is usually looked for in Merchandise near the first of October. The Imports continue large, and the amount taken for consumption heavier than in September of last year. The Exports of Domestic Produce are on a liberal scale, and the Cotton receipts, a chief source of foreign exchange in the Fall and Winter months, are coming to market freely. Nearly 100,000 bales have already come in in excess of the crop of last year. The price has given way to 18½@20c. for the middling grades.

Money is in sharp demand from the Southern and Western Banks, to move the crops. These Banks rely upon their New York corresponding Banks to re-discount their Bills, receivable in the shape of drafts against Grain and Provisions and Cotton shipped to New York. They have drawn down their City balances very close, and our Banks here are unable to accommodate them in the usual way, because of the heavy falling off on their own Deposit lines as compared with last Fall. The movement is now nearly $33,000,000 less on Deposits and $29,000,000 on Loans and Discounts. The merchants are not pressing in their demands on their Banks for Discounts, though a considerable amount of paper finds its way to the Street at 8 to 12 per cent. per annum.

The price of Gold has been steady at 113⅝@114 per cent. The Exchange on England is greatly below the Gold shipping point, and Bills on London are selling at 107½@107⅝ per cent. The Stock market has a steady look to-day at the quotations below,

The following are the comparative movements of the City Banks for the past fortnight:

	Sept. 21.	Sep. 28.
Capital	$87,315,700	$87,315,700
Loans	280,845,300	272,205,800
Gold and Greenbacks	55,856,500	56,946,300
Deposits	201,127,800	195,450,000
Circulation	27,068,100	27,735,100

PRODUCE AND PROVISIONS.

NEW YORK, Monday, Sept. 30, 1872.

Receipts,—The receipts of the principal kinds of produce since our last are as follows:

Corn, bush		993,000	Meal, bbls		4,420
Oats, "		236,550	Flour, "		65,000
Wheat, "		661,000	Eggs, "		6,366
Rye, "		—	Cotton, bales		17,722
Barley, "		58,200	Hops, "		1,120
Malt, "		3,200	Wool "		1,622
Seed, "		1,520	Butter, pkgs		16,480
Beans, "		1,800	Cheese "		59,800
Meal, bags		630	Lard, "		2,559
Peanuts "		1,230	Dried fruits, pkgs		2,770
Pork, bbls		861	Cut Meats "		1,318

Beans and Peas,—No further changes in prices of mediums are reported. The arrivals are small with a moderate jobbing trade. Marrowfats are quiet. A small sale of new is reported at $2.90. Green peas are firm.

We quote Mediums, prime $2.70@2.75 per bushel; good do., $2.40@2.60; fair do., $2.00@2.25; prime marrowfats, $2.70@2.75; good do., $2.40@2.50; common and fair do., $2@2.25.

Beeswax,—There is a fair stock with small sales at 34@31½c. for Western and, 35@36c. for Southern.

Broom Corn,—The demand is small, with prices nominal. We quote at 3@5c. for red, 5@6c. for green, 7@8c. per hurl.

Butter,—The arrivals are quite heavy, and as we have only the ordinary Fall demand, stock is accumulating to a certain degree. None of the strictly-fine grades are left over, but there is still a large proportion of the supply exhibiting the effect of a hot Summer, and buyers are still very cautious in handling it. Pails are fairly firm and unchanged. Some early Fall Welsh is arriving and is marked up pretty close to choice half tubs. Shippers have taken only a small quantity. Exports past week, 370 firkins. We call the market firm for choice grades of table and steady for good market lines. Common and weather-damaged lots dull and very irregular.

Orange Co. pails, fine, 33@35c.; Penn. and N. J. pails, good to fine, 25@33c.; common, 15@18c.; selections, half tubs, 30@31c.; half tubs in lots, 27@29c.; good to prime firkins, 26@28c.; do. Welsh, Fall, 26@28c.; Welsh tubs, fair, 20@23c.; other grades of State, 18@22c.; Western Reserve, choice, 21@22c.; Western fair to good, 13@15c.; common, 10@11c.; grease butter, 7½@8½c.; Pa. and N. J. pails, medium to fine, 23@30c.; poor, 15@18c. State dairies, 26@28c. Western is in very light delivery.

Cotton,—The arrivals are fair and receivers are free sellers at further concessions. The demand is entirely from consumers and shippers.

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	15¾	15½	15¾	15¾
Good Ordinary	18	18	18⅛	18¼
Low Middling	18¾	18½	18¾	18⅞
Middling	18⅞	18⅞	19⅛	19⅛
Good Middling	19⅜	19⅜	20¼	20¾

For forward delivery the market is steady. Latest sales on the basis of low middling are at 18¾c. Oct.; 18⅝c. for Nov.; 18⅝c. for Dec.; 19¼c. for Jan.

Cheese,—The market has shown more animation with a firm feeling at an advance of about ½c. The cable quotes a higher market on the other side, and shippers have been looking around and making more confident bids, but the light amount of ocean room offering has prevented buying as liberally as desired. The trade have further been encouraged by a marked improvement in the home trade, a large number of lots being taken for shipments to the South. Exports for the week, 20,506 boxes.

We quote State factory, choice, 13¼@14c.; good to prime, 13@13⅜c.; fair, 12½@13c.; State dairy, 12½@13c. for good to prime, 11½@12c. for fair lots; Ohio factory, 12@13c. for good to prime.

Dried Fruits,—In apples very little business is reported. The low prices comparatively ruling throws more trade on the best qualities, and common stock is hard to move, unless at unprofitable figures. There is a very fair supply, and buyers are somewhat indifferent. Peeled peaches still meet with considerable attention; it is understood speculators are buying them up as fast as possible. One or two full lots of unpeeled peaches have been placed at about steady prices. Blackberries have a very light sale. Cherries are dull. Quotations are, for Southern apples, 3¼@6c.; do. sliced, 8@9c. Peeled peaches at 14@17c. for Ga., 12@14c. for Va., and 14@20c. for North Carolina. Unpeeled peaches at 5c. for quarters, and 6@6½c. for halves. Cherries, 22½c. Plums, 14@15c. Blackberries, 10@10½c. Plums, 14@15c.

Eggs,—The market advanced to 30c. for Western, but this price brought stock in from all points, and checked the demand to some extent, and at the close most parties were willing to sell at 29c. We quote at 29c for Western, and 30@31c. for State, Pennsylvania and Jersey.

Flour,—A further slight decline in prices is reported, but at the close a good home trade is going on, and although exporters refuse to buy to any extent, there is a firm feeling.

Superfine State	$6 15	@	6 60
Common extra do	7 25	@	7 40

Rye, common to fine	4 35	@	5 35
Corn meal, Western	3 40	@	3 75

Fresh Fruits,—Peaches have outlived their welcome, and quotations are nominal for the small, juiceless ends of orchards. Apples are still low, and most of them very little above the cider-mill prices of the country. Pears are in good supply, excluding Bartletts, which are about over commercially. A few of the latter sold during the week above $5 per bbl. Other fancy pears are selling quite briskly this season. Packers seem to have hit just the right idea of putting them up; we have never seen fancy stock so beautifully ripened in lots, and very many of the city retail stands now present a splendid pomological picture, while the reasonable rates permit ordinary buyers to arrange a dessert, thought in old times as only attainable from the most aristocratic French nurseries. Grapes abundant, Concords showing the heaviest, and prices have had a wide range. We have begun to receive stock in better order, and when the soft and cracked lots are used up prices will be steadier. The experiment of packing the late California invoice in cork-dust was not a success. The plan seems only to work well with the tough-skinned varities from Europe. Plums continue plenty, and do not advance materially. Cranberries are in fair demand. Apples, poor, per bbl. 50c@$1; do. fair to good, $1.25@1.50; do. fine, $1.75@2. Peaches, Delaware, baskets, 50c.@$1; do. extra, $1.25; do. Jersey, baskets, 25c.@$1. Pears, common, per bbl., $2@3; do. Duchess, $7@12; do. Seckel, $7@12; do. other fancy, $5@8. Plums, common, per bbl., $2.50@4; egg $6@8; do. damson, $7@8. Grapes, common, per lb., 2@4c.; do. good, Concord, 7@8c.; do. extra, 9@10c.; do, Catawba, 8@10c.; do. Delaware, 9@12c.; do. Iona, 10@12c. Cranberries, per crate, $2.50@3.25; do. bbls., $8@10. About 2,000 bbls. apples were exported last week.

Grain,—Wheat and spring grades are wanted by shippers, and higher prices are offered. Other grades are plenty and difficult to place, unless at concessions. We quote No. 2 Spring in store $1.50@1.53, No. 1 do. $1.62@1.73, Winter red Western $1.71@1.85 for new, amber Western $1.71@1.85, white do. $1.70@2.02. Rye is quiet at 80c. for Western in store. Corn is selling freely to shippers and the home trade, with prices a trifle better. Sales at 64½@65c. for steamer lots of Western mixed, 65½@66c. for sailing do. Oats are lower, but closed active and firm. Sales at 40@43c. for new Western mixed, 45@47c. for old do., 43@45c. for new white, 38c. for black.

Hay and Straw,—Shipping hay has been difficult to move to any extent, mainly owing to the scarcity of freight room, but there is a steady market. Straw is selling slowly, but the arrivals are moderate. We quote new shipping hay at $1@1.05; retail do., $1.35@1.60; salt, do., 55@80c.; clover, 75@80c. Straw at $1@1.05 for long rye, 75@85c. for short rye; 70@75c. for oat.

Hops,—Prices are about 7c. lower. Trade is very dull and the receipts have been fair. Brewers have been buying small lots only. Foreign are offering at low rates. We quote New York, growth 1872, at 28@30c. for choice, 26@28c. for good, 20c. for poor; Eastern do., 25@30c.; Western do., 25@27c. for prime, 20c. for common.

Poultry and Game,—Dressed poultry is in good demand, with moderate arrivals. Prices of live are in the seller's favor, with a good trade.

We quote:—Ducks at 75c.@$1 per pair. Geese at $2@2.50 for Western per pair; $2.50@$3 for Jersey do. Prairie chickens, 85c. per pair. Woodcock, $1.25. Partridges, $1.37@1.50. We quote dressed poultry at 21@22c. for prime State chickens; 19c. for fair lots do.; 20@21c. for prime State fowls; 18c. for fair do.; 23@24c. for prime turkeys; 19@21c. for common. Live poultry at 18@20c. for spring chickens, Western; 18@22c. for Jersey; 18@20c. for fowls; 19@22c. for Jersey turkeys; 19@20c. for Western.

Provisions,—There has been a good, healthy tone to pork, and the market closes firm at $11 for cash round lots or any early future month. An active jobbing demand has helped to strengthen the market and retail quotations in this way have been very steady at $11.15@14.20. Prime mess is in few hands and not quoted. Extra prime at $11.50. Bacon is quiet, buyers are well loaded up and spot long clear has declined to 8½@8¾c.; short clear is firm, having been bought so largely ahead at 9c. Future bacon dull, a late sale of short and long together 7¾c. for Jan. delivery. Beef is strong for good qualities, low grades neglected. We quote $5@7 for plain Western mess, $8@10 for extra do. Tierce beef at $13@16 for prime mess; $16@19 for India mess. Beef hams are in buyers' favor, $29@30 per bbl. Lard was "cornered" towards the close of the month and 9¾c. was at one time asked. A good many contracts were settled at 9c. and at the close 8¾c. is a full selling price. Stored lots are running very irregular, owing to the extreme hot weather of the past Summer. Some large parcels that were sold to go on contracts have been rejected by the 150 tes. City lard dull at 8¾c. for No. 1, 8¼@

8¾c. for steam and kettle. Cut meats firm, with a good local demand for smoked hams. No Western pickled meats are here. City smoked hams, 15@17c., do. pickled, 13@14c.

Seeds.—Some small amounts of grass are noted, and holders are willing sellers at the quotations. Timothy is selling at $3.75@4. Clover at 9¾c. for Ohio, 10¾c. for Indiana and Michigan, and 10¾ for State. Rough flax is selling at $2.05.

Sundries.—Small lots of honey quoted at 20@28c. for dark and 25@30c. for light, in glass boxes; mixed lots, 21c. Cider plentiful, at 6@10c. per gal. Feathers, live geese, new, fine, ₱ lb., 70@70c.; do. mixed, 10@50c.; hen, 7@9c.; vinegar, cider, ₱ gal., 20@25c.; do. manufactured, 15@20c.; newspapers, ₱ lb., 4@4½c.; white rags, 5@5¾c.

Tobacco.—There is a good consumptive demand for Kentucky leaf, and full rate prices are maintained. In seed leaf the business is slow at the moment, the recent full sales having almost supplied the wants of the home trade. Prices are firm. Foreign is selling freely to the home trade at full figures.

Vegetables.—Irish potatoes are in good supply and more in the buyer's favor. Sweets are declining, with a dull trade. Our quotations for potatoes are for bulk lots.

Early Rose, bbl., $1.50@2.12; Jackson White, $1.50@1.75. Peach Blows, $2.25@2.50. Tomatoes, 60@75c. Squash, per bbl., $1@1.50 white and yellow. Cabbages, $3@10. Onions, red, ₱ bbl., $2.50@2.75; yellow, $2.75@3. Sweet potatoes, $3@3.50. Pumpkins, $7@8. Garlic, per 100 bunches, $10@12. Russia turnips, ₱ bbl., $2@2.50.

Wool.—Holders have been compelled to name lower prices in fleeces. At the reduced figures trade continues very slow, and there is an unsettled feeling. Foreign is selling slowly, with prices rather more in the buyer's favor. We quote fleece at 50@55c. for New York and Michigan; 52@59c. for Ohio; 50@55c for Indiana and Wisconsin; 47@53c. for Illinois; 50@55c. for Texas, fine; 30@35c. for do. coarse. Pulled, 50@60c. for extra.

Whisky—Is lower, with a slow sale. Western is quoted at 92c.

COUNTRY CHEESE MARKETS.

Little Falls, N. Y., Sept. 28, 1872.

THE market at Little Falls for the week ending Sept. 28th was active, with large transactions. Farm dairies sold, in some instances, as high as factories, the rates running at 13, 13¼, 13⅜, and 13½c. The delivery by railroad and canal was over 1,200 boxes.

In factories the offerings were about 15,000 boxes, over 10,000 of which, it was estimated, changed hands. We give quotations of leading transactions as follows:

Avery & Ives	13¼	Herkimer Co. Union	13¼
Cook & Ives	13½	J. D. Ives	13⅜
Craine's Corners	13⅜	Manheim	13⅜
Danube Cold Spring	13⅜	Manheim Center	13⅜
Eatonville	13⅜	Manheim Turnpike	13⅜
Elm Dale	13	Mohawk Valley	12⅞
Fairfield Association	13½	Newville Ass'n	13⅜
North Fairfield	13⅜	Norway Ass'n	13⅜
Old Fairfield	13⅜	Osgood	12⅞
Fays	13	Reyder	13⅜
Freeman	13	Sand Hill	13⅜
Henderson Associat'n	13½	Sebor Lane	13
Herkimer	13⅜	Stratford & Salisbury	13⅜
Herkimer Co. Central	13⅜	Van Epps	13

A few packages of butter were delivered and sold at prices ranging from 24 to 26c., according to quality. We have advices from abroad for the second week in Sept. American cheese is active, and the quality shows an improvement. The best is quoted at 64@65s.; fine, 62@63s.; good, 56@60s. Other descriptions of cheese sell as follows:—English Cheddar, 76@84s.; Wiltshire double, 66@72s.; Cheshire medium, 56@60s.; fine, 76@80s.; Scotch, 66@74s. Dutch cheese:—Edams, 60@68s; Goudas, 50@56s.; Derby shade, 54@60s.

Butter is quiet but firm. Clonmells, 116@118s.; Corks, 122s.; Normandy, 126s.; Canadian, 50@80s. The corresponding prices last year were, for American cheese, 56s.; Clonmells butter, 130s.

The weather is warm and pleasant in Herkimer, N. Y., with no frost as yet to injure afterfeed.

LIVE STOCK MARKETS.

NEW YORK, Sept. 28, 1872.

WITH very large supplies of live stock following a heavy week, and a good deal of warm, rainy weather which compelled the butchers to sell off stocks which they had begun to accumulate, our markets could not well be in a worse condition. Taking the cost of cattle into account and the prices at which they were sold here, and we have seldom had so hard a market. And still the butchers have fared no better, for let them buy their stock ever so low, and in most cases it had to be sold still lower. Hot weather forced its sale even at 2@3c. ₱ lb. for carcases of Texan beef which cost 7@8c., so that losses were distributed all round.

RECEIPTS OF LIVE STOCK.

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.
Totals this week	10,111	68	2,941	38,486	43,184
" last week	10,610	60	2,723	28,612	40,312
Average last year	7,187	88	2,301	25,132	25,177

Beeves.—We have now had an extraordinary run for two weeks in succession, and that, too, when the weather was very unfavorable. After the hard close last Monday, with many cattle left over, stock continued to come forward, though it was not wanted and could not be sold even at ruinously low rates. Butchers had been losing heavily, and had a good many unkilled cattle still on hand, so nothing would tempt many of them to purchase at all. Those who did buy got stock fully 1c. below the rates of the previous week. There were more than 500 cattle left unsold last night, and Saturday is no market day. Not a few of the cattle sold for less than they cost in Chicago. One drove sold for $3 ₱ head under the price paid for them in Ohio, besides sinking all the freight and other expenses. This gave operators anything but a cheerful look, and not a few complained of being sick. Ordinary Texans sold at 7c., with pretty fair Illinois steers at 10¼c., some of them weighed clear down to 51 lbs. ₱ cwt. when they would really make 56 lbs. Of course we want few cattle for the coming week, and owners are ordering stock held back. The run of Texan cattle is very large. A few contracts have been made for fancy bullocks in the country at prices much above what anything sells for on the market. There is always a good deal of competition for such cattle.

The following are the closing prices for the week in comparison with what cattle brought one week ago, for net weight of beef:

	This week. Cents.	Last week. Cents.
Choice beeves, ₱ lb.	13 @ 13½	14 @ 14½
Good to prime	11½ @ 12½	12¾ @ 13½
Medium	10½ @ 11¾	11½ @ 12¾
Poorest grade	7 @ 10	7 @ 10
Average sales	11¼ @ —	11¾ @ 12

Milch Cows.—The low price of beef and late decline in milk combine to operate against the sale of new milch cows. Prices are not much lower, but sales are made with difficulty. It is very evident that the production of milk in and around the city is lessening each year. Its place is more than made good by that brought in on the railroads, both in its natural and condensed state. Cows range from $35@70 each.

Veal Calves.—The only change in veals is a little firmness in choice suckers, a few selling up to 10¼c., but 10c. is the fair market price for the best. Several hundred fine Bucks Co., 135@140 lbs., sold at 10c. Fair milk veals go at 9@9¾c., with common at 7@8c., and grass calves at 4@6c., one lot, very poor, selling at $3 per head.

Sheep and Lambs.—Arrivals larger, and still quite a good many have been stopped off on the way here and sold to farmers for stockers. The market is not good, the low price of beef injuring the mutton market. Some thin lots of sheep sold below 5c, and very few exceed 6¼c. In fact, it takes a fat lot to reach that price. A lot of hard, cull lambs went at 6¼c., but as a general thing thin lots sell at 6¼@7c.; fair at 8c., and good to prime, 8¼@8½c., a few choice going at 8¾c., but they were really fine 70 lb. State lambs. The average per head, for sheep and lambs, is from $5 to $5.50.

Hogs.—Arrivals are large and the market has been a fluctuating one, though the rise and fall has not been great, only a sort of saw-saw motion. The latest phase is ¼c., advance for dressed, the close being 6¾@7c., with live at 5@5¼c., two cars selling at 5¼c.

LATEST.—Monday, September 30, 4 P. M.—Beeves.—Arrivals to-day, 181 cars at Communipaw, 128 at 100th St., and 31 at Weekawken, making 5,894 for the present market. Trade very dull and prices still lower on all but prime stock, which is scarce. It is impossible to sell out. The market is completely overstocked.

Sheep and Lambs.—Arrivals for to-day's market, 13 car loads at Communipaw, 21 at 48th St., and 18 at 40th St., making 11,296 on sale. The only change is a lower ruling of lambs, the best selling at 8c.

Hogs.—Receipts to-day, Sunday included, 44 car loads at Communipaw and 56 at 40th St., making 11,026. The market closes strong and active at better prices, or 6¾c. for heavy, 6¾@7c. for medium and 7¼c. for pigs.

SPECIAL NOTICES.

RUPTURE CAN BE CURED

without suffering. ELASTIC TRUSSES are superseding all others. Before buying Metal Trusses or Supporters, send for a descriptive circular to the ELASTIC TRUSS CO., No. 683 Broadway, New York.

"FAMILY FAVORITE!"

THE

WEED. WEED.

The most perfect, reliable and generally useful machine in existence. For the family of the farmer or mechanic, where the work required of a sewing machine ranges from the heaviest garments of men's wear to the most delicate and ornamental fabrics for ladies and children, it has proved itself thoroughly efficient and entirely satisfactory. Of unequaled simplicity and compactness of construction, capable of being learned and operated with one-fourth the usual expenditure of time and labor, with a capacity for quantity, quality and variety of execution beyond its competitors, and a reputation for durability and reliability known and appreciated by thousands, it is offered to the people for the most critical inspection and comparison, with confidence that its obvious merits cannot fail to convince the careful examiner of its superiority. Manufactured by the

A FARM FOR SALE IN MISSOURI, 35 miles south of St. Louis. For particulars, address A. VREELAND, Hillsboro', Jefferson Co., Mo.

SOLDIERS Desiring to secure the benefits of the late Homestead Law, will learn something of advantage by addressing M. D. FLOWER, Adjutant-General of Minnesota, ST. PAUL, MINN.

HOMES.—The Eastern Shore of Maryland is settling up very rapidly. Great advantages over the West and Far South. Send for Catalogue. E. MANCHA & BRO., Ridgely, Md.

TO DAIRYMEN AND CAPITALISTS.

1,000 Acre Dairy Farm for Sale, with Stock, Implements, &c.

PRICE.....$40,000.

The subscriber offers for sale SPRINGWATER FARM, consisting of 1,000 acres, situated on Scugog Island, Ontario Co., Canada, and distant three miles from Port Perry, the terminus of the Whitby & Port Perry Railway, and close to the waters of Lake Scugog, where there is an abundance of fish and game.

This farm is specially adapted for dairy purposes, being watered with numerous springs, all the buildings being supplied with water from this source, conducted through pipes, as well as cattle yards, &c. There are on the place twelve houses for workmen, five large barns, horse and cattle stables, sheds, pens, &c., and one large dairy building, through which a stream of water constantly runs. The soil is first-class, never failing to produce heavy crops. There is a reserve of wood land in connection with it, sufficient to meet the requirements of the place. The farm would be sold in one, or two blocks of 500 acres each, the purchaser having the option to take cattle, stock, horses and implements at a fair valuation, made by disinterested parties.

TERMS OF SALE.—For the Land—$10,000 down, balance on mortgage for from 5 to 10 years, with interest at 7 per cent. per annum. For Stock, Implements, &c.—$5,000 down, balance in one year, without interest. Parties desiring to see the place, or to purchase, will please address WM. S. SEXTON, Port Perry P. O., Ontario, Canada.

JOHN N. LUCAS, Counselor at Law, President. Hon. L. L. HOLBROOK, General Manager.

South Platte & Republican Valley LAND COMPANY.

The U. S. Land Office, for the Southern and Western part of the State of Nebraska, recently located at Lowell, Kearney Co., contains the largest amount of good farming, unoccupied land of any Land District in the United States.

Homesteads selected and located for soldiers, under the late act of Congress, without their personal attendance at the U. S. Land Office.

Address, for particulars, either the President or General Manager, at Lowell, Kearney Co., Neb.

References:—The Register and Receiver, U. S. Land Office, Lowell, Kearney Co., Neb.; and Hon. P. W. HITCHCOCK and Hon. T. W. TIPTON, U. S. Senators; and Hon. JOHN TAFFE, M. C. from Neb.

A CHOICE FARM FOR SALE.—Situated 1¼ miles south of the County Seat, Girard, Crawford Co., Kansas. Mo. River, Fort Scott and Gulf R. R., runs on the east side of the farm, about 200 feet from the east line. Contains 160 acres, all under fence; 125 acres under cultivation; 1,300 apple trees; 200 standard pear trees; 500 peach trees; with house, good corn crib and granary, hog lots, &c. It is well watered, and I will sell it at $40 per acre; one-third down, the balance in one and two years. Apply to H. W. CONVERSE, Fort Scott, Kansas.

FARM FOR SALE.—A GOOD DAIRY Farm, situated 4 miles from the Erie Railroad Depot, at Friendship, N. Y., containing 350 acres. Well watered, good orchard, buildings, and stabling sufficient for 66 cows. For particulars, address BUTTS & McCLUMPHA Friendship, N. Y.

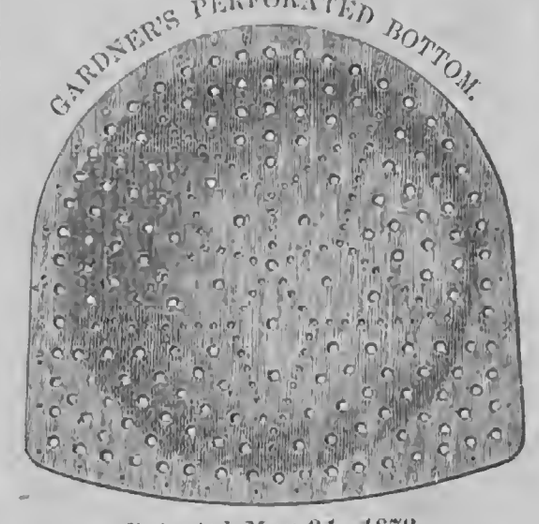
Address T. WILLIAM & CO., Publishers, Philadelphia.

Implements, Machinery, &c.

HALL'S PATENT HUSKING GLOVES.

The very best thing ever invented for husking corn. They protect the hands from the cold, or from becoming sore, and a person can husk from one-third to one-half faster with them. The Half Gloves cover the parts of the hands liable to become sore. Price, $1.25. The Full Gloves cover the whole of the hands. Price, $2.50. Both have claws attached for tearing off the husks, and are made for both right and left-handed persons. In ordering, state size—large, medium or small. For sale by dealers generally. Manufactured by the HALL HUSKING GLOVE CO., 143 South Clinton St., Chicago, Ill.



Patented May 21, 1872.

GREAT IMPROVEMENT IN CHAIR SEATS.

Various have been the efforts of men to produce a seat which should be comfortable, light, comely, durable, and also admit of universal application. The degrees of success have been as varied as the effort; but within the last year the long-sought was revealed to an observing, practical genius, and is hereby offered to the public, in full confidence of its instant appreciation.

The seat is composed of three layers of veneer (boards as thin as a knife blade), the grain of each lying in an opposite direction to its neighbor, all glued firmly together in a slightly dishing form, adapted to the person. The entire thickness slightly exceeds one-sixth of an inch. Withal have moderate cost, little weight, neatness, great beauty if desired, and a lasting quality which, in usual service, may properly be called eternal. *While it is especially adapted to reseating chairs by any one who can nail down a carpet*, it is coming rapidly into use for the better class of chairs for sumptuous apartments. The slightest observation will convince the most skeptical of its unequaled merits.

MARION

UNITED STATES WATCH CO'S WATCHES.

REPORT OF JUDGES
TO THE GENERAL COMMITTEE
CINCINNATI INDUSTRIAL EXPOSITION:

GENTLEMEN—The Judges appointed to examine into the merits of the articles contained in Class 10, beg leave to make the following report:

No. 1650 United States Watch Company, Marion, New Jersey. These watch movements, the result of American capital, skill and perseverance as specimens of this branch of science and manufacture, rival those of European make. The watches exhibited by this Company are of all grades, from that of the most exact timekeeper, to the cheaper kind for the million. All are excellent of the kind, and are too well known and appreciated by the people to need further comment. First Premium is awarded to the United States Watch Company.

E. L. Wayne
James Powell
William M. Davis
} Judges.

Price Lists furnished the Trade on application, inclosing business card. For sale by the Trade generally.

Ask your Jeweler to see the MARION

WATCHES.

BEWARE of worthless imitations with which the country is flooded. To avoid imposition, see that the words MARION, N. J., are engraved on the plate over the Main-Spring Barrel. All others are spurious.

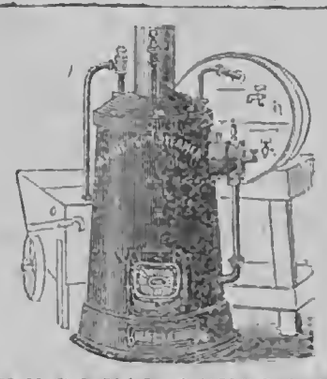
GILES, BRO. & CO. 83 & 85 State St., Chicago, Ill.

GILES, WALES & CO. No. 13 Maiden Lane, New York.



ANDERSON'S AGRICULTURAL STEAMER, for *Steaming* FEED FOR STOCK, Heating Cheese Vats, Tannery Vats, Conservatories, &c. This Steamer is made of Wrought Iron, thoroughly riveted and finished in good style. It has a reliable Automatic or self-regulating Water Feeder, Safety Valve, Vacuum Valve, Water Gauge Cocks, Whistle, &c., all complete. The boiler is peculiar in construction, being ONE COMPLETE HOUSE BOILER WITHIN ANOTHER, the two communicating one with the other. It has an extraordinary amount of fire space for the size of the boiler—No. 3, a medium size, having 3,853 square inches of fire surface; consequently, it requires but little fuel to run it. Either wood or coal may be used for fuel.

It will cook more feed, or heat more water, in a given time, than any other Steamer of the same size or cost. It is more durable than any other, for the reason that the fire-box is made of wrought iron, and is *entirely surrounded with water*. We are also manufacturing

Anderson's Low Pressure Steam Heater, for Heating *Private Dwellings, Stores, Churches, Conservatories, &c.* We manufacture for all the territory east of Illinois.

For further particulars, address

AGENTS Wanted.—Agents make more money at work for us than at anything else. Particulars free. G. STINSON & Co., Portland, Maine.

Miscellaneous Advertisements.

Hot. Everybody. WEEKLY!

THE FAMILY PAPER FOR THE COMING YEAR!

ONLY FOUR DOLLARS A YEAR IN ADVANCE.

The New Weekly will retain all the prominent features of the Present Monthly form, and combine with them the best of other Journals, making it emphatically **The Family Paper of America.**

Its Contents will be varied, and one aim is to secure the *best* efforts of Home writers, uniting with them the gems of other Countries. It will give more reading matter in a year than any Four Dollar Magazine or Paper.

Each Number will contain an Elegant Full Page Engraving on heavy toned paper, exceeding in value, any Chromos or Lithographs ever offered as premiums, but we place ourselves beyond competition, for, in addition, **Four Elegant Chromos will be given to Each Subscriber.** No steam Lithographs, or worn out plates, but full Chromos, made expressly, and can only be obtained by subscription. No Agent is authorized to collect subscriptions until the Chromos are delivered, so that *each subscriber gets what is paid for.* They can be Framed, or Bound in the Volumes, thus removing the objection raised by many; for no one objects to the elegance of a bound volume merely because others may have it.

No. 1. The French Canadian. A Character sketch from an original painting by Krieghoff, the eminent artist, whose "Lumbering in Canada" elicited universal admiration at the Paris Exposition, and was finally purchased by Emperor Louis Napoleon for Fifty Thousand francs.

No. 2. Daisy.—We do not claim this Design as original, but ours is the first Chromo. The original painting is by Kuaus, Du Berlin, and the Steel representation has become the most popular and commands the highest price of any of its size ever imported. The coloring for our Chromo is by the eminent Artist, Fahrendin, whose Crayon Portraits and Color Sketches are so well known in all the large cities. In adopting this as one of our Series, we only adhere to our rule of selecting the best wherever found.

No. 3. The First Commissioner of Excise.—This is a Companion piece to No. 1, and by the same Artist (Krieghoff). The two form the finest pair of *Dining Room Chromos* ever published.

No. 4. The Dip.—From a Photograph from life and colored in Oil. It will speak for itself, and every heart will warm toward the little Brunette of seven summers, whose sweet face and graceful "pose" form the subject. As a Companion for No. 2, they form a pair of Parlor Chromos "*too sweet for anything.*"

Title Pages. Two Elegant Engraved Title Pages will be furnished each year, for our interest is greatly advanced by the certainty that our paper will be preserved and bound.

Our Price.—Other Publishers said we could not afford a paper like our present Monthly for *Two Dollars a Year*, but our subscribers know that we *have* done so, and in spite of prediction that we certainly cannot retain its expensive features, and furnish more than four times as many numbers for only twice the price, we say we *will* do it, and the presentation of the Chromos in advance is evidence that we mean what we say.

Four Dollars a Year Payable in Advance. Send Three Cent Stamp for Sample Copy.

EXTRA INDUCEMENTS.—We will furnish FOR EVERYBODY and its Premiums and the RURAL NEW-YORKER with its Premiums for Only Five Dollars, if subscription is sent previous to November 1st.

AGENTS WANTED.

"EAGAN'S COMPOSITION."

(Patented March 5, 1867.)

Used in laying streets, roadways, sidewalks, in lining cellars, cisterns, vats, and in the manufacture of sewers and sewer-pipe, water-pipe, drain-pipe, gas-pipe, roofing and architectural ornaments.

STREETS.

Eagan's Improved Macadam pavement for streets is destined to take the place of all other forms of pavement, for the reasons, viz:

It is cheaper, more durable, more easily and perfectly repaired. Is impervious to water, and no atmospheric change will affect it.

It is free from mud and dust, and is noiseless.

It is smooth without being slippery, and has sufficient elasticity to make it the easiest pavement known for animals to travel over.

DURABILITY.

The reason a Macadam road does not last longer is because the stones are loose and rub and grind upon each other—dust and mud is the result. Eagan's Composition holds the rocks firmly together, thus completely remedying this evil, and confining the wear of the road to its surface.

SIDEWALKS.

Eagan's Composition is peculiarly adapted for sidewalks and lawn walks, private roadways, gutters, etc. It can be made into blocks and laid in squares or diamond form, or made one continuous sheet, covering arched work more perfectly than the largest flagstone, and at one-fourth the expense.

Walks made of it have a smooth, hard and even surface, pleasant to walk upon, always clean and free of ice, and of as great durability as if made of the best flagstone. Sidewalks made under Eagan's patent cost but little if any more than if made of plank, and are as durable as rock.

ROOFING,

Made of this composition, is far superior to the common felt roofs that are made of gravel, felt, coal-tar and pitch. The latter is liable to run in warm climates and to crack in cold. By the peculiar chemical combinations in this composition both of these objections are obviated, and a roof produced equal to slate, at a cost of about one-third as much per square.

CELLAR BOTTOMS AND SIDES,

Lined with this composition, from one to two inches thick, keep perfectly dry and warm in winter and cool in summer, and are rat and vermin proof.

FLOORS.

Floors made of it may be painted any color; and are as pleasant to tread upon as if made of wood.

CISTERNS AND VATS.

Eagan's Composition is impervious to water and insoluble in acids, making it just the thing for lining vats in breweries and manufactories of most kinds. It is equally well adapted for cisterns, much better than the best hydraulic cements, and not subject to decay from any cause.

PIPING.

Piping made of Eagan's Composition has been in use for five years in San Francisco, Cal., where it was first invented. It has given entire satisfaction, almost entirely superseding all other kinds of piping for sewers or drains. It is easily and cheaply made, and has the advantage of being made at any place without a great outlay of money for machinery, tools, buildings or materials.

Pipes can be made of any required size, are cheaper, and will sustain a greater external or internal pressure than any other kind of cement pipe.

CEMENT.

As a cement it is acknowledged, by scientific men who have examined it, to be the strongest known. A wall built of brick or stone, and this cement used as a mortar, would be perfectly solid as if made of a solid rock.

SEA WALLS.

Sea walls can be built with this material in combination with broken rock, more rapidly and cheaper than in any other way.

DIPLOMAS.

First premiums have been awarded to Eagan's Composition from the following Fairs:

California State Fair, at Sacramento, Cal., 1868.
Mechanics' Institute Fair, San Francisco, 1868.
Sonoma County Fair, at Petaluma, Cal., 1869.
St. Louis Agricultural and Mechanical Fair, at St. Louis, 1869.
New Jersey State Fair, 1870.
It has been exhibited at no other Fairs.

RECOMMENDATIONS.

OFFICE OF UNION RAILROAD COMPANY,
ST. LOUIS, Mo., 28th March, 1871.

This specimen of Pacific Concrete, (Eagan's Patent,) was taken from the Union Street Railroad of St. Louis, Mo., where it has been in use since December, 1869. Since that date the teams of the railroad have passed over that portion of the track where the concrete is used, 300 *times each day*, while that same portion of the track is constantly used by other trains and vehicles of the city. This pavement has received no repairs whatever, and shows but little wear after constant use for sixteen months (now 22 months). In summer it is free from dust, and in winter brings with it no inconvenience from snow and ice. The Macadamizing at either end of this block of concrete is renewed three times each year, is soft and wet when much water is used, and in all probability will require such renewing for several years to come before the concrete needs repairing. The block of Pacific Concrete in the track of the Union Railroad has given entire satisfaction. WM. STORK, Sup't.

This Company will take contracts in any city of the United States to make Macadamized Pavements, and will guarantee them to last twenty years, and keep them in repair for a small percentage. Will also supply orders for Drain, Sewer, Water and Gas Pipe. Roofing for sale.

TO INVESTORS.

To those who have funds to invest in large or small amounts, or who wish to increase their income from means already invested in other less profitable securities, we recommend, after full investigation, the Seven-Thirty Gold Bonds of the Northern Pacific Railroad Company. Bearing seven and three-tenths per cent. gold interest, (equal now to 8¼ currency,) and sold at par, they yield an income considerably more than one-third greater than U. S. 5-20s. They are Coupon and Registered, the lowest denomination being $100, the highest, $10,000.

Nearly one-third of the Main Line of the Road will be completed and in operation with a large business the present season. All the property and rights of the Company, including a most valuable Land Grant, averaging about **23,000** acres per mile of road, are pledged as security for the first mortgage bonds now offered.

All marketable stocks and bonds are received in exchange at current prices. Descriptive pamphlets and maps, showing Route of road, Connections, Tributary Country, &c., will be furnished on application.

JAY COOKE & CO.,
NEW YORK, PHILADELPHIA AND WASHINGTON,
Financial Agents N. P. R. R.

General Accident Policies of the TRAVELERS INSURANCE COMPANY *of Hartford, Conn., may be obtained without delay of any authorized agent, without the trouble of a rigid medical examination.*

They are written for the month or year.
They insure men of all occupations and professions.
They insure against general accidents.
They cost but a small sum.
Their cost is the same, all ages from 18 to 65.
They are valuable to all classes of men.
Every man should have one.

Fashions for Fall and Winter.

1170

GODIVA. This Polonaise is one of our latest Paris Novelties. It contains many new and very valuable features. Without looping it can be worn as a long tight-fitting basquine, or looped (as shown in cut) it is a most elegant Polonaise. The ornamental back piece passes over the shoulders and forms a neat bust cape in front and is "adjustable;" may be worn or not as fancy dictates, thus constituting two entirely different Polonaises in appearance. The back piece is sometimes made in velvet or satin, and richly trimmed, and completes a brilliant toilet when worn with a house dress. Besides its beautiful variations it is well adapted to any material. Takes six yards of 24 inch goods. Price of pattern with cloth model ONE DOLLAR. See PREMIUM OFFER below.

1165

NEW FALL WRAP, is a sacque and cape, with a thribble box-pleat laid on the under side in the back, and in place of the broad pleat of last season; just the three edges are visible from each side, giving the appearance of six round folds, the cape slopes gracefully to the back, and is left open to trim. The sacque has a large sleeve, which can be used or not, as weather or comfort demand.

We give this as one of the very best for fall and winter cloak made in either velvet or cloth. The original is of dark blue ladies' cloth. Scolloped and bound with velvet and velvet buttons. Takes three yards of ladies' cloth. Pattern, with cloth model, 50 cents. *See premium offer below.*

762

PRESTO. Chemise for lady. Its great success in leading all other styles is owing to its perfect fitting band and sleeve. The curved arm-size is an improvement of *much* value, as it will not *cut* the shoulder or *bind* the arm, and also avoids the homely, perplexing gusset. Takes three yards linen for medium-size. Pattern, with cloth model, 25 cents. See Premium below.

We give a CLOTH MODEL with each pattern which SHOWS every seam, plait, gather, loop, etc., how to put the garment together by the pattern, and how it will look when completed. By the use of our Cloth Models any person who can sew can FINISH the most difficult garment as easily as the plainest. They are PERFECT GUIDES.

Premium Offer!

If you write the following, viz.:

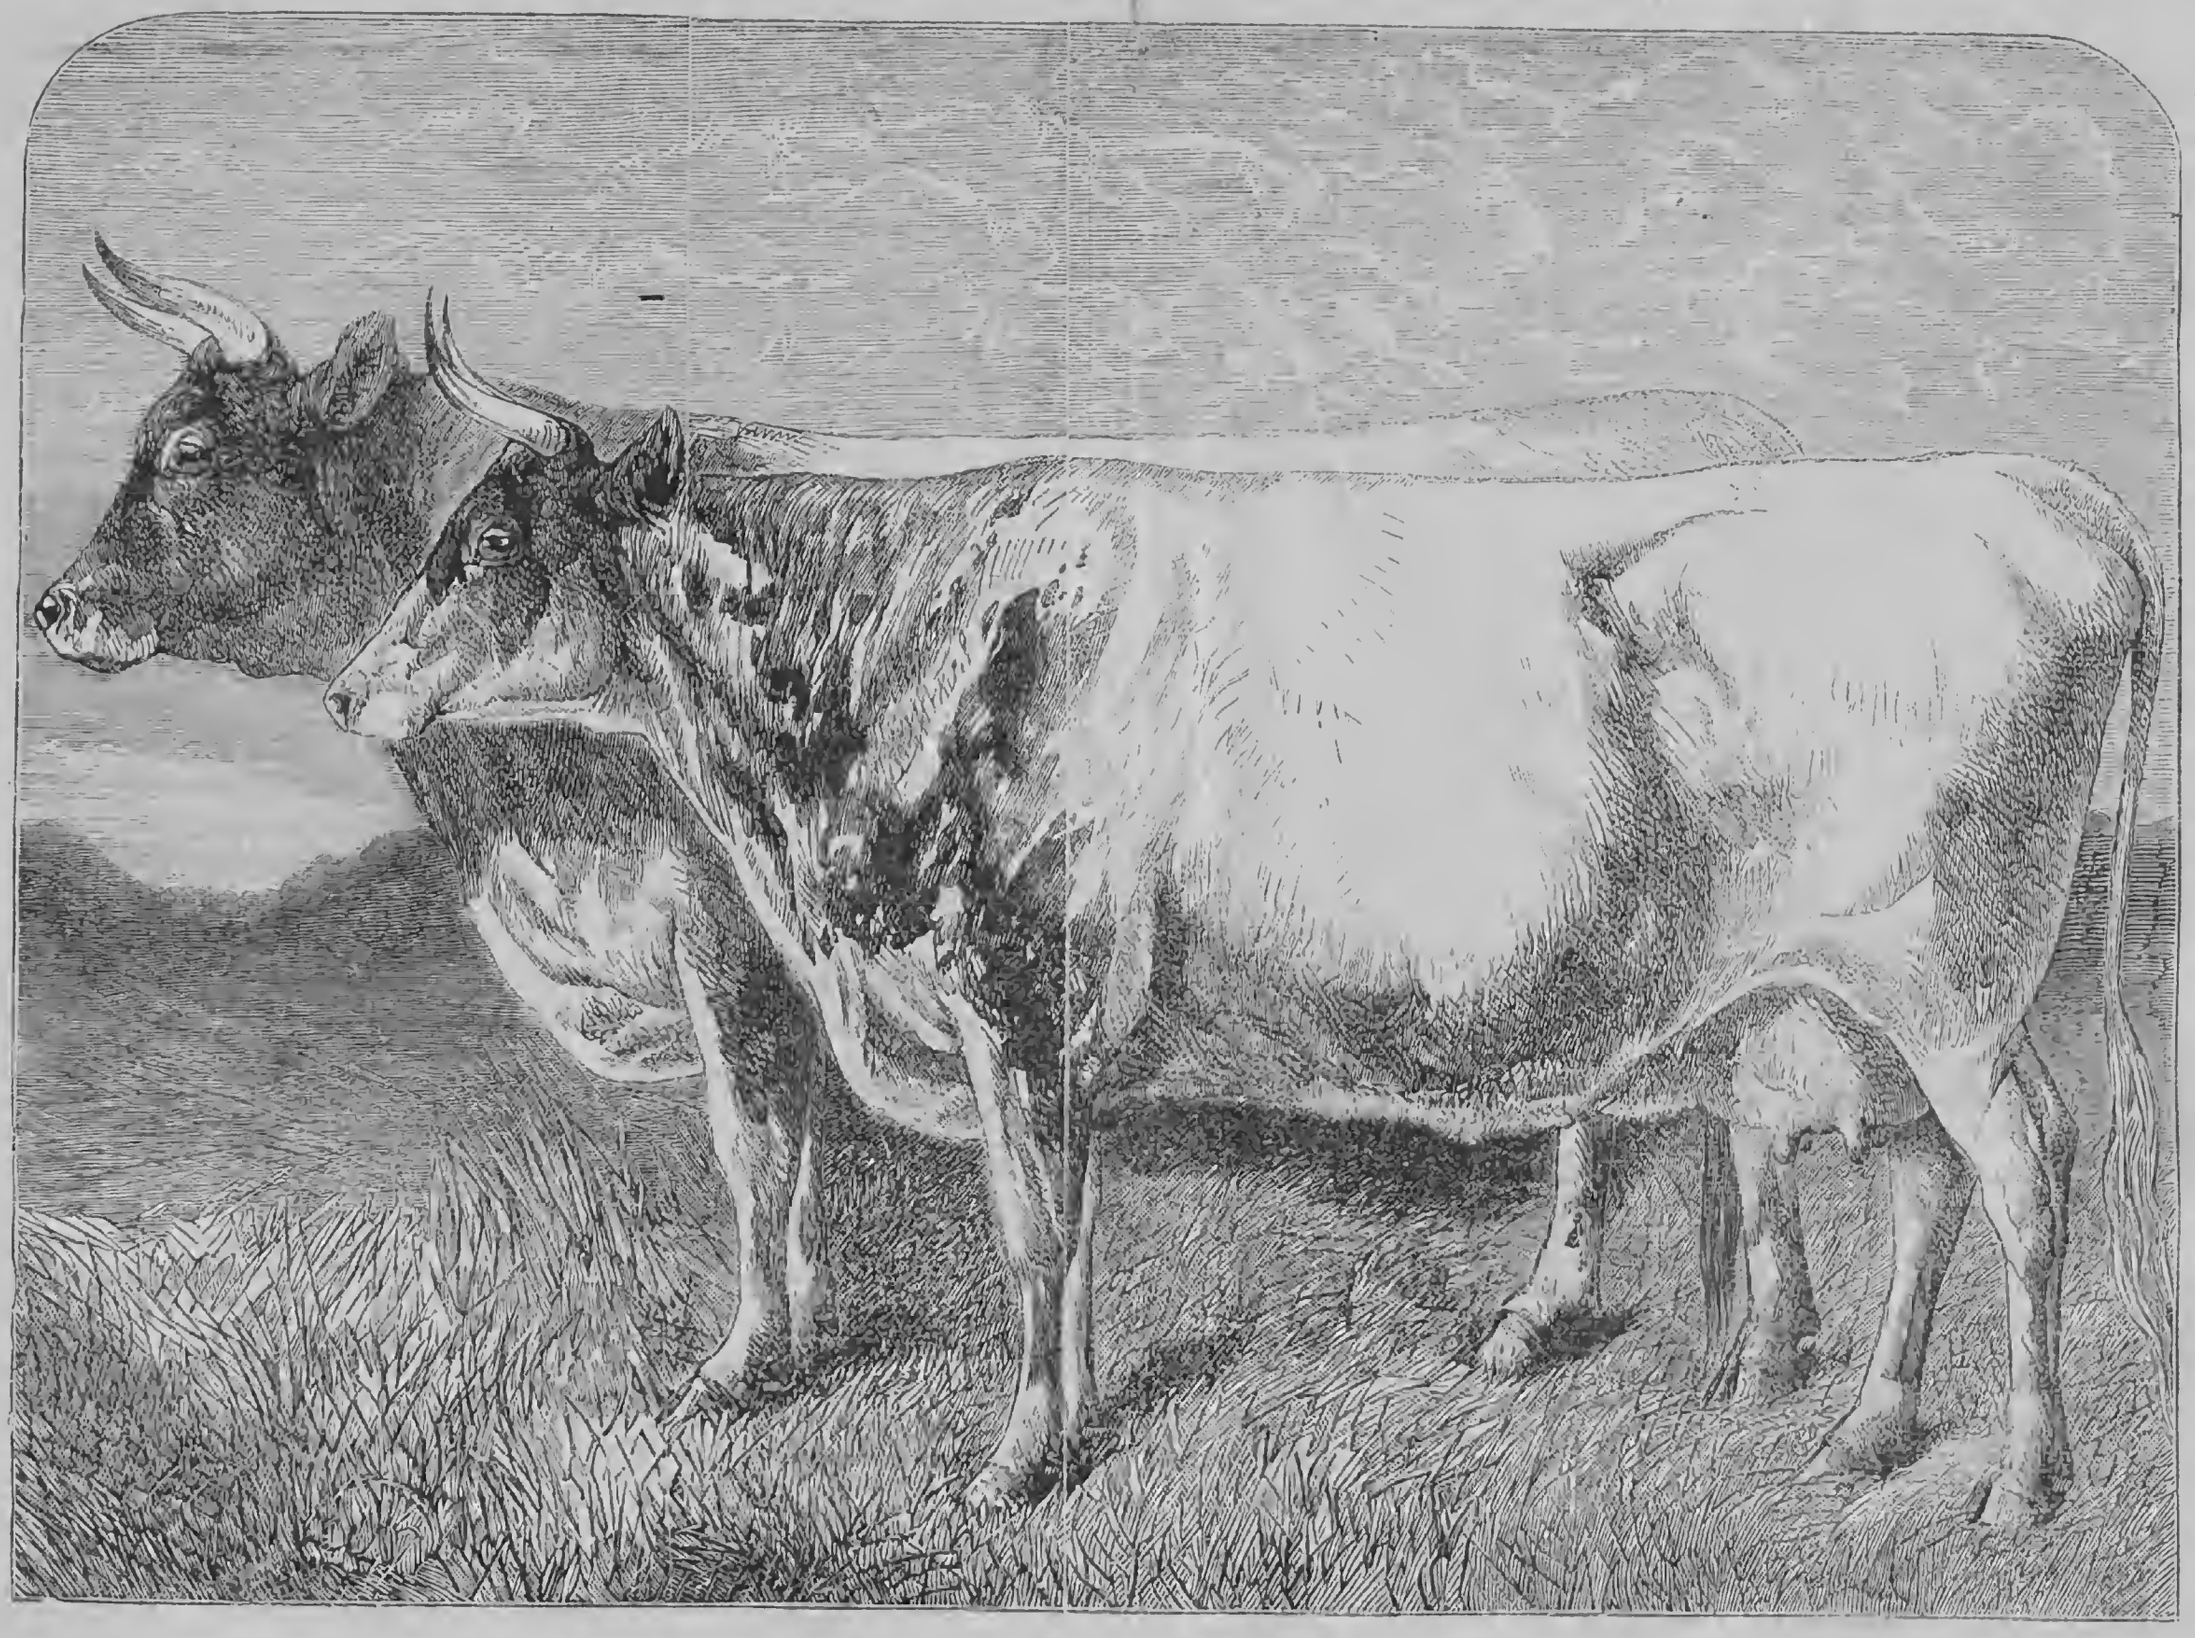
The Herdsman.

AYRSHIRE CATTLE.

HEREWITH we present an illustration of the modern English type of Ayrshire cattle, from drawings by HARRISON WEIR. This breed originated in the County of Ayr, Scotland, which consists of three districts—Carrick, Kyle, and Cunningham. The latter district claims to be the cradle of the improved Ayrshire dairy breed, of cattle. The Aryshire cattle, in 1780, in the district of Cunningham, were then of small stature and badly fed; they were mostly black, with white spots on their faces, back, and other parts of their bodies; the cows had high-standing crooked horns, marked with very deep ringlets at their base, a true indication of their meager fare. GILBERT MURRAY writes to the London Field that the improvement of the Ayrshire breed dates from about the year 1780, first by a cross with a stranger breed, combined with a better system of feeding. AITON, who wrote a survey of the county, and who was himself a farmer in the district of Cunningham, could well recollect the appearance and condition of the cows in that district as far back as 1766. After great pains taken to inquire into the origin of the present celebrated breed, he was of opinion that they are descended from the native stock of the district, changed in their color, and partly in their shapes and qualities, by being crossed with the Teeswater or Dutch breeds. However valuable the breed has now become, it is said the first offspring of the cross was far from being of the best shape. The race was chiefly propagated by coupling bulls of the stranger with cows of the native races, and, as the former were far superior in size to the latter, as might naturally be expected, the progeny had at first an ill-shaped, mongrel appearance, with bones large and prominent; but these cattle soon toned down, accommodating themselves to the state of the pastures; and the improvements that began about that time to be made on the soil of the Western counties rendered the pastures capable of supporting much heavier stocks.

The most desirable quality of dairy cows, of any breed, is that they should yield a large quantity of milk in proportion to the quantity of food they consume, and that when dry they should fatten quickly. The pure-bred Ayrshire certainly excels all other in the former, and as to the latter she is no way inferior to many of the best established breeds. Of the quantity of milk which an average Ayrshire dairy cow yields it is difficult to speak with precision; there is not only a great diversity between some of those animals and others, but the quantity and quality of the food, the size, age, and habit of the animal, distance from or to the time of calving, all exercise a marked influence on the quantity of milk yielded at any given time. Whatever is said on the subject is open to contradiction by such as are disposed to cavil. AITON says that some of the dairy cows in Ayrshire yield for a time from five to six gallons of milk per day. Such returns are, however, rare; yet many, when in their best plight and well fed, will yield four gallons per day for three months, and during the season produce a total of 800 to 900 gallons per cow. Many will, however, not yield more than half that quantity, and probably 600 gallons per cow during the year may be taken as a fair average of the Ayrshire dairy stock. AITON goes on to say that since the publication of his survey the farmers have satisfied him that he has underrated the produce of their cattle, and that they have furnished him with satisfactory proofs of various cows having produced from six to seven gallons per day for several weeks; these, he remarks, are, no doubt, extraordinary returns.

The most approved points of the Ayrshire cow are:—Head small, but rather long, and



AYRSHIRE CATTLE.

narrow at the muzzle; eye small, but quick and lively; horns small, clear and crooked, and placed wide apart at their base; neck long and slender, tapering toward the head, with no loose skin below; shoulders thin; fore-quarters light; hind-quarters deep and large; back straight, and broad behind; the joints rather loose and open; carcass deep; pelvis capacious, and wide over the hips, with round, fleshy buttocks; tail long and thin; legs small and short, with well-bent joints; udder capacious, broad, and square, stretching well forward, but neither fleshy, low hung, nor loose; the milk veins large and prominent; teats short, and all pointing outward, and at considerable distance from each other; skin thin and loose, and the hair soft and woolly; the head, horns, and all those parts of least value, should be small, and the general figure compact and well proportioned.

The Ayrshire farmers prefer their dairy bulls to possess the feminine aspect in their heads, necks, and fore-quarters, with broad hock bones and hips, and full in the flanks; they likewise pay particular attention to the formation of the small teats of the bull, and also to the color of the scrotum. If this were of any other color than white, though the animal might otherwise be possessed of great merit, he would immediately be rejected by the best breeders.

The farmers of Ayrshire have long devoted great attention to the improvement of their dairy cows. When cows are kept solely for the dairy, and are profitable in proportion to the quantity of milk they yield, self-interest would stimulate the farmer to acquire the most correct knowledge of cultivating the desirable qualities in his stock. If one cow excelled in milking, they would look out for others in which the leading characteristics were fully developed; they reared the calves of the best milkers, knowing that they would, to some extent, inherit the good qualities of their dams. It has been chiefly by these means, and not by changing the stock or crossing with bulls of other breeds, that the Ayrshire dairy stock of the present day has attained its unrivaled perfection.

The Naturalist.

NOTES FOR NATURALISTS.

The French Rat-Tamer.—The most popular of the shows of the season at St. Cloud fair has been *l' homme aux rats*. The name of this Rarey of the rat-race is ANTOINE LEONARD. His sole theatre is a sort of perch, which he sticks into the ground, and then he takes his *corps de ballet* out of his pocket. At his word of command the rats run up and down the perch, hang on their legs, then on two, stand on their head, and, in fact, go through a series of gymnastic exercises that would put BLONDIN himself to the blush. His crack actor is a gray rat he has had in his troupe for eleven years; this old fellow not only obeys LEONARD, but is personally attached to him. It is a curious sight to see LEONARD put him on the ground and then walk away. The creature runs after him, and invariably catches him, however many turns he may make to avoid him. An Englishman offered 50f. for him about two years ago, but LEONARD would not separate from his "old and attached friend."

Snake's Rattles.—I send you a fine specimen of a snake's rattles. The rattlesnake was five feet long, and around its greatest diameter four inches. It was killed just after it had bitten a large dog. Strange to say, the dog survived. Your paper always meets with a hearty welcome, and I wish that it would fall into the hands of every Southern planter. You ignore politics and attend to your legitimate business. Wishing you abundant success, I am—I. ALLEN DUNCAN, *Barnwell, S. C.*

We are much obliged for the specimen, for it is an old saying that "all are fish that come into a Naturalist's net." When a boy we used to suppose that the age of a rattlesnake could be told by the number of rattles on its tail; but this, like many other things learned in youth, have had to be unlearned; for sometimes more than one rattle is added in a year; then again, one or more is lost. The rattles you send are thirteen in number, and we presume they are those of the Diamond Rattlesnake (*Crotalus adamanteus*, BEAUV), which is found from the Carolinas southward. They are sometimes found fully eight feet long.

Ants on Peach Trees.—A writer in the Boston Cultivator says that in his experience he has been led to look upon the black ant as his best friend in the peach orchard, his only object in traveling up and down the tree being to destroy lice, which frequently cover the young and tender leaves of the peach tree.

Field Crops.

WHEAT IN DELAWARE.

T. B. COURSEY recently read a paper on "Wheat Culture in Delaware," before the Farmers' and Mechanics' Club of Harrington, Del., from which we make the following extracts:

I remarked a while ago that the falling off in our crop was attributable to the deterioration in seed. I will now try to show what has caused this deterioration. I think that our soil and climate are not perfectly adapted to the wheat plant. If they were, we would find it growing wild, as in California and Oregon. But the main cause of degeneracy is caused by fly. The habits of wheat necessitate such late seeding that the plants have not time to get a vigorous start to carry them through the Winter; especially when it happens as last Winter—very cold, with an insufficiency of snow to cover it. It maintains a sickly existence, and is poorly prepared to resist the ravages of fly in the Spring, and passing through a similar ordeal year after year, must of necessity reduce its vitality, and, as a consequence, become an easy prey to all enemies of the crop.

It may be proper here to inquire when is the best time to sow with the best chance of escaping those enemies. This is difficult to determine, for there seems to be no time of universal application. What may be the proper time for one locality may not be best for another. But from an observation of many years, I am induced to believe that the first week in October is the safest time in this county, taking a series of years together. Earlier than this would be safest against rust and sun blight, but more risk from fly. I have rarely known an entire failure when seeded at that time. I have known many failures when seeded earlier. Especially was this the case with the crop just harvested. I know of several fields seeded in September, which the fly nearly ruined, while others seeded only one week later entirely escaped its ravages. The next question is,

What Variety Will Best Stand the Fly and Climate?

The Mediterranean seemed to stand our climate longer than most others, but it, too, had to succumb to the enemies of the crop. When first imported it would stand the fly with an early seeding, but after a series of years, became, like other varieties, an easy prey. To prove this, I will give a case under my own observation, which I think fully demonstrates the necessity of renewing our seed-wheat frequently:—Mr. H., on an adjoining farm, renewed his seed from wheat but a few years from importation. In sowing his field he fell short a gallon or so from finishing the field. He sent to his barn and got enough to finish, which was done immediately, and received the same treatment as the rest of the field, no part of which escaped the fly, but that part from renewed seed served to resist its attacks, and growed on vigorously. But not so with that from seed of his own production (though both were of the Mediterranean variety); his was literally eaten up; even the grains that scattered over on the other land were eaten. And while this from renewed seed made over twenty bushels per acre, the other was barely worth harvesting. This, to my mind, shows the importance and necessity of renewing our seed wheat every few years directly from the wheat-growing countries of Europe, and from that section the growth of which has proved best adapted to our climate.

Bringing seed from other sections of the United States may, in some cases, prove benelicial, but, in my opinion, is not to be relied on, as I have proved to my own satisfaction. I sent, a few years ago, to Rochester, New York, and, at considerable expense, procured twelve bushels of a variety highly recommended there, and sowed it on the same field with wheat of my own growing, and found, at harvest, that I had gained nothing by way of improvement. I have made several attempts to change the character of our seed-wheat by renewing from neighboring States, and from far-off California, but with very little success, except from late importation. It is, therefore, in my opinion, essential to our success that we have fresh importations from abroad every few years. And I know of no better way to get a genuine article than for your club to raise a fund by subscription, and authorize your President to order a few barrels from some port on the Mediterranean, where can be had the variety last introduced here (the blue stem Mediterranean). These few barrels, sowed thin, on highly improved land, would soon furnish enough to supply your entire club with seed, and soon sell enough, at an advance, to pay the expense of importation, or raise a fund for renewal every few years, so that when you once get a start it would pay its way and give you fresh seed as often as needed.

I would here remark, that none but varieties known to succeed here should be purchased, except in trifling amounts. I bought of a new and beautiful variety, a few years ago, at ten dollars per bushel, and put it on the best land in the field, and dressed it with as good phosphate as there is in market, at 500 pounds per acre, and that was the last of it. I did not reap a sheaf, and have no desire for any more of the kind.

But renewing the seed is not all that is necessary to insure success. The land, if not already rich, must be improved and put in the best possible condition to receive the seed.

In sections of country well adapted to the wheat plant, the virgin soil may be sufficient in itself to produce a good crop of wheat without manure, and I have no doubt that our old land, with a good clover lay, would produce a good crop if we could sow in August or early September. For a crop of clover equal to 2½ tons to the acre, would permit more than enough of all substances, both organic and inorganic, for a crop of 25 bushels of wheat to the acre. According to analysis it would furnish an excess of potash 53 lbs., of lime 54 lbs., magnum 5 lbs., sulphuric acid 5 lbs., phosphoric acid 1 lb., chlorine 6 lbs., being largely in excess of the wants of the crop. But the ravages of the fly compel us to sow later than Aug. or Sept., as some of us have found to our cost the present season, consequently the clover crop could not be assimilated or prepared for assimilation in time to give the wheat plants a vigorous start and prepare them to resist our Winters, which, though not so cold as further North, are subject to longer periods of freezing and thawing with an insufficiency of snow to cover it. This late sowing necessitates the liberal use of manure of some kind, and that kind which can be most expeditiously applied and most readily assimilated by the plant, would prove most successful. Barn-yard manure contains all the elements necessary to the perfection of the wheat plant. But it is bulky, and requires too much labor in its distribution for a wheat crop, and withal, is not as readily assimilated by plants as some of the commercial manures.

It would therefore seem to be wise economy to use good commercial manures on wheat, and use barn-yard manure on land intended for corn, by applying in the Fall, Winter and early Spring before the ground is done freezing and thawing.

But, say some, "It takes all my surplus wheat to pay for the fertilizers I bought; how are we to stand that kind of farming?" That is bad, but remember that you had but half a crop, a full crop would have made a difference in the financial account. But suppose you had never used any commercial manure, where would your clover and corn crop be? Just a little poorer than 20 years ago—a few nubbins and no clover. A single crop does not exhaust all the fertilizing elements in a dressing of good commercial manure. It is seen in after crops for several years, and if properly followed with grass and lime, makes a permanent improvement. In proof of this I will give two or three cases with which I am familiar, not presuming that these are the greatest in the county, I give them because I know the facts and figures.

A gentlemen of my acquaintance bought a farm near Leipsic in this county in 1863. The corn crop was then 400 bushels. The same amount of land in 1871 produced 2,100 bushels. The average wheat crop where he bought it was 60 bush. The average crop now is over 500 bush.—quite a change in the product; and this was brought about by the use of concentrated manure, except about 200 loads of compost bought at the town near by at $2 per load. I know another who bought a farm in 1860. It paid, as rent, 80 baskets of nubbins. The same farm last year produced over 1,400 bushels shelled corn, and this crop had no concentrated or other manure applied to it, as most of the barn-yard manure was applied to potatoes and other truck, and there has not been a single load of compost manure bought for this farm since 1860; consequently the increase in the corn crop is entirely attributable to former dressings of commercial manure on wheat. If this proves anything, it is evidently to the interest of the agriculturist to use, liberally, *good* commercial manures, even though they be high priced, too high priced to give the farmer a chance with other classes. But even high as they are, it is better to use them than not to use them, and as I have no interest in any in the market, am not disposed to advertise any article, will only say that if you get a good article at a fair price you will not lose your money.

NUT-GRASS COFFEE.

PLEASE find inclosed a—something for name. Some of these kernels were sold last year to a neighbor for a kind of coffee, said to grow South. It is very thrifty in growth. One of these kernels planted will produce nearly a pint. They are attached to the roots and all under ground. Is the article fit for coffee use or drinking? Please answer in paper.—CHAS. H. FUAREY, *Rockdale Mills, Mass.*

THIS plant was introduced from China about twenty years ago, under the name of Chufa, or Earth Almond. Its botanical name is *Cyperus esculentus*, or edible cyperus. It is closely allied to those great pests of the Southern States, *C. phymatodes* and *C. rotundus*. A variety of the last is the well known Nut-Grass, or Coco-Grass, which almost every planter will tell you cannot be exterminated from land when it once gets a foothold. Now, the edible foreign species is quite tender in the North; at least we have never been able to save it in the open ground through Winter, therefore there is no danger of its becoming a pest here; but whether it is a good substitute for coffee or not we are unable to say, never having tried it or heard of its being used for that purpose. The nut-like roots being rich in saccharine matter, we should think they would be excellent for feeding hogs, if good for nothing else.

IN this box is a plant sold to be used for coffee. Will you tell us, through the RURAL, its name and its virtue?—M. J. T.

THE coffee plant peddlers must have had a good time in selling the people, as well as selling their wares, judging from the letters and specimens received. Now, this plant has been advertised and sold by all our seedsmen for the past fifteen years, and still there are traveling louts who can make folks believe that they have something new to offer in this same root. Will our people ever learn that no traveling peddler ever did carry for sale a thing of value that could not be obtained cheaper elsewhere? In other words, men who perambulate over the country offering new and wonderful plants, seeds, medicines and nostrums of all kinds are, as a class, the meanest and lowest kind of vagabond swindlers. Of course we except agents of respectable merchants and nurserymen; but such men always carry proof of their respectability, and if this is not shown let them alone, no matter what firm they pretend to represent.

FIELD NOTES AND QUERIES.

The Colored People and Cotton.—A Missouri correspondent who has visited Mississippi writes the RURAL NEW-YORKER:—I hope the RURAL will be spread more and more in the South, though during my trip I showed it several times to some first-class planters and it was thrown back at me with, "We want no such Yankee humbug among us; nor Yankee school teachers. The niggers are too smart now." The fact is, the poor darkey, if he makes, thirty, forty or fifty bales of cotton comes out just as much in debt as though he made but seven, eight or ten bales. Why? Because he cannot read and figure, and so he gets some one to ship his cotton, and that is the last he ever sees of it or of the money. Thousands of them are no better off to-day than they were the first year after the war, and for the reasons herein given.

The Potato Disease.—Dr. KUHN has shown that the fungus which causes the potato disease, (*Botrytis* or *Perenospora infestans*), only propagates itself while the potato plant is living. Therefore the potato tuber receives its infection from the haulm or stems, and one potato cannot communicate disease to another.

Selection of Seed.—WRIGHT B. HOLCOMB is informed that we have met farmers who have a local reputation for producing the best wheat, rye, oats, corn and potatoes, who have gained and maintained it by a careful selection and use of the best seed these respective crops produced from year to year. Some of them have secured what are regarded distinct varieties, by watching their fields and selecting such stalks of grain as showed remarkable growth and perfectness of development. Any farmer, with care, can do the same thing.

Dairy Husbandry.

BAD MILK.

I AM the foreman of two cheese factories. I have charge of as much milk as any one man that I know, and it comes in all conditions to the factory—milk that is diluted to milk that is thick with putrefaction. I have kept up a good reputation for five years, and my cheese command the very highest market price. But, for the last ten days, I have had at the factories milk that when taken, to all appearance, is good, but on standing for an hour or two it becomes thick, but still sweet, having a bad taint. Sometimes during this time the weather has been dark, warm and rainy. I am at a loss to tell where the trouble comes from. I know that it is not through my neglect, and it makes my heart sink and I grow sick of the factory business. Our milk is made up twice a day. If you think this worthy of your notice, I would be glad to hear from you.—M. H. BOOTH, *Summit Co., O.*

THE past Summer has been a very trying one for factorymen in all parts of the country. We hear of a great many cases like that detailed by our correspondent, and the trouble, no doubt, comes from neglect or carelessness on the part of patrons in the care of milk before it reaches the factory.

We have, from time to time, discussed in these columns the leading causes which are productive of bad milk, and have suggested the means for avoiding the difficulty. Farmers do not seem to appreciate the importance of preserving milk in good order until it reaches the manufacturers' hands. They seem to think so long as milk may be kept from *souring* the whole work is accomplished and all responsibility is at an end on their part.

This apathy or unprogressive spirit on the part of farmers leads to the most serious losses every year, and more especially is this the case during extremely hot weather like that which we have had during the past Summer. The troubles which the cheese makers have to meet do not come altogether, or for the most part, from sour milk or from its liability of souring; it is rather from a putrid decomposition, some of the forms of which are like that described by our correspondent. This trouble could be avoided in a large number of cases simply by cooling and aerating the milk at the farm before it is started for the factory.

But what is most remarkable in all this is that when factorymen and patrons have been made acquainted with the cause of tainted milk, and the remedy for its prevention, means are not at once taken to avoid the trouble. One would naturally suppose that patrons would be eager to adopt any feasible plan for increasing the value of their product; and why they should go on losing a penny a pound, or more, on their cheese, simply from gross neglect in the care and treatment of milk, it is not easy to see. The various factory associations should have a meeting of all their patrons at the commencement of the season, and agree upon a set of rules in respect to the treatment and care of milk from the time it is drawn from the cow to its delivery at the factory. In respect to the treatment of tainted milk in the hands of the manufacturer, we must refer our correspondent to Practical Dairy Husbandry, pages 431 to 437. The experience of the most successful cheese makers are here given as to the treatment of putrid milk in the cheese vats and the factory.

TESTING MILK WITH THE HALIMETER.

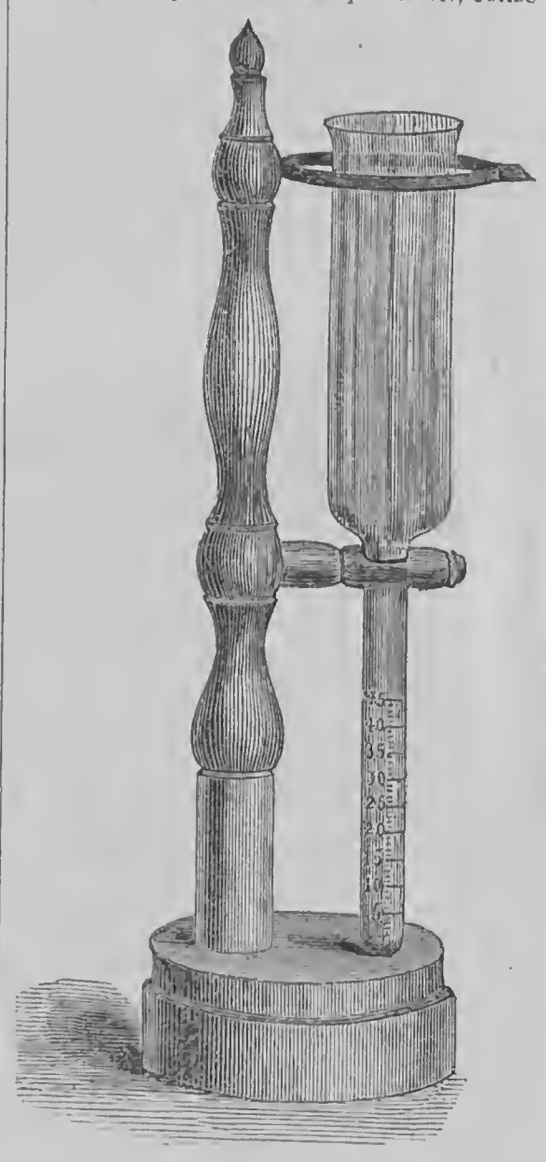
REICHELT of Ansbach, has used the Halimetrical Probe of Fox for determining the amount of water in milk. The method is founded on the supposition that 100 parts of water will dissolve 36 parts of pure table salt. It is useful also in determining how much salt there is in any known fluid, the water of which is in condition to dissolve the salt, and hence from this the water may also be computed.

For this purpose Fox has constructed a Halimeter which is open at the upper end (see figure) the lower part terminating in a tube or graduated glass scale, the lines of which correspond in grains with the old Prussian medicinal weights by which the quantity of undissolved salt remaining in the fluid may be seen and the amount determined from the scale.

In testing milk the process is as follows: From any given sample of milk to be examined, 1,000 grains are taken and mixed with 324 grains of common salt and 240 grains of litmus tincture saturated with salt—the whole being at a temperature of 25° or 30° Reaumer. The mixture is then well shaken together and poured into the Halimeter, care being taken that no undissolved salt is left remaining in the vessel. The mixture is again well shaken in the Halimeter and when left at rest the quantity of undissolved salt may be read off on the graduated scale. The quantity of water in the milk may then be reckoned from the grains of dissolved salt. This equals n.—according to the proportion 36:100=n:x.

The addition of the litmus tincture is only for the purpose of making it more easy to determine the limit of the remaining salt, partly by the coloring which it imparts and partly by the thinness of the milk.

In a trial of milk by this method, the remaining salt came to 4 grains. The 1,000 grains of milk therefore dissolves 320 grains of salt, corresponding to 888.89 grains of water or 111.11 grains of dry substance. The determination of the dry substance of the same milk through evaporation, with the addition of crystalized quartz, the drying being at a temperature of 100° to 110° Centigrade, yielded 11.033 per cent., consequently a difference of 0.078 per cent. In an examination of cream the Halimeter essay gave 14.306 per cent. of dry substance, while the evaporation essay gave 14.696 per cent.—a difference of only 0.390 per cent.



FOX'S HALIMETER.

In another trial, milk containing 10 per cent. of dry substance was thinned with 2 per cent. weight of water. The Halimetrical essay of this thinned milk yielded 9.722 per cent. dry substance, while according to the computation there should be 9.804 per cent., a difference of 0.082 per cent.

Prof. B. MARTINY, who figures and describes the Halimeter in German, and from whose work we have translated the above, is of the opinion that this method of testing milk to determine its dilution with water can be made useful on account of its simplicity, and the ease with which it is effected. As the method will be new to many of our dairymen who are desirous of other tests than that of the cream gauge and Lactometer, we introduce it to notice.

Stagnant Water for Cows Productive of Typhoid Fever.—Out of 140 families supplied with milk from a dairy in Islington, England, seventy suffered from typhoid fever. One hundred and sixty-eight individual cases occurred within ten weeks, and thirty died. An investigation showed that the cows drank water from an old underground tank, built of wood, and much decayed. The milk cans were washed in the same water, and in all probability the water was also mixed with the milk. As the fever attacked only such parties in that district as used the milk, the water in the rotten tank must have been the cause. This is only one more evidence of the danger of using foul water and giving it to animals. It has been shown that stagnant water acts as a slow poison to animals as well as men, and it is a matter of the first importance to all dairymen and stock raisers, as well as families, to use only pure, fresh water.

The Apiarian.

DYSENTERY IN BEES.

AT a recent meeting of the Michigan Bee Keepers' Association the following paper was read by Dr. BOHRER, Alexandria, Ind. on the above subject. He said:—Gentlemen—At the request of your Secretary I would submit the following, in regard to the prevalence of dysentery among bees during the past Winter. The general causes giving rise to this affection among bees are sufficiently well understood by a large majority of apiarians, to render it unnecessary for me to give a description of them at this time, farther than to mention them in detail, if required, in demonstrating ordinary causes from which this malady is known to spring, had but little if anything to do with its origin among bees during the past Winter in the United States and Canada; for it is well known that thousands of colonies, populous in numbers, well supplied with honey and in good Winter quarters, perished despite every effort that could be brought to bear by the most experienced, most skillful and most industrious bee keepers of the country.

I am fully aware that it has been asserted by some that the recent great mortality among bees was due to the carelessness on the part of the bee keeper in not putting them to Winter quarters at the proper season and in a proper manner. But inasmuch as I have conversed and corresponded with many relative to this matter, who have formerly been not only very attentive to the wants of their bees, but had also been eminently successful in wintering them, I think I have good grounds furnished me for concluding that such statements are (to us a new expression) simply too thin.

Others have been disposed to attribute it to the extraordinary severity of Winter; but when we come to consider that the mercury often sinks lower in Canada than it did in this part of Indiana during last Winter, and that bees nevertheless winter well even on the Summer stand in that country, without any other protection than that furnished by the hive, we are at once lost in attempting to account for the late ravage of this disease in this way, as bees perished here, and even as far South as Tennessee, in large numbers. True, the apiaries in Southern districts were not as nearly depopulated as they were here and in other districts of the North. But the inhabitants of each colony were reduced in numbers much below what they commonly have been, thus proving two things, first, that there was from some cause more than ordinary predisposition to dysentery, this being the universal complaint; and, secondly, that owing to the frequent opportunities afforded bees in Southern climates of flying out and discharging their excrement, this malady proved less fatal there than it did in sections where the excessive cold weather confined them to the hive for periods of time altogether beyond what they could endure in a diseased condition. From this standpoint it will be seen that cold weather had but one effect, which was that of rendering dysentery more fatal by confining the bees to the hive.

It will be out of the question to attribute the origin of this disease to an excess of atmospheric moisture, as it never was known to be dryer than it was last Winter throughout the United States. Neither can we come out and occupy the ground that bees were put up into Winter quarters without a proper amount of ventilation, for in this particular they fared as usual. But after searching in every quarter for the cause, I find nothing more than has heretofore been common until I came to examine the honey, which last Fall presented no external evidence of its unfitness for bees to winter upon successfully. But as time progressed a portion of it granulated and left a watery substance which ran out of the cells, and down upon the bottom board, where it soured in many instances. Just what kind of honey it was I am not fully prepared to say, but as there were no flowers from which bees could collect honey last Winter in one section, I suppose it to be honey-dew they were collecting, as they came in heavily loaded every day for a week or more, yet I did not take it upon myself to search for this substance in the forests, and may have been mistaken, but don't think I was.

After I saw it in the condition above described, I almost concluded that it was collected from grapes, but as there were not enough grapes in our parts to furnish so much honey, I fell back to honey-dew. I have made inquiry of several persons who claimed to be acquainted with this substance, and find them laboring under the impression that bees will not winter well when confined to this material as food. I have also learned that honey dew last season was quite common in all sections where dysentery prevailed as an epidemic. If this information be correct, I think we have found out the true cause of this disease as it prevailed last Winter, and would therefore recommend to bee keepers the custom of emptying their combs with the extractor in September, and feeding sugar sirup in all cases where it is known that the hive is stored with honey-dew. It will, however, be advisable to make haste slowly by ascertaining as we go along, whether or not my conjectures are correct as to honey-dew being unfit for bees to subsist on over Winter. A few colonies out of a large number set aside will be sufficient to test the matter in any one apiary.

The Garden.

GARDENERS' NOTES.

Tomatoes in Pots in Winter.—Have any of your readers any experience in producing tomatoes in pots or boxes in sunny living-rooms or the kitchen in Winter, where an equable heat is kept up. We, back here in the country, away from markets, like tomatoes fresh; and if we can get them in this manner it will be worth trying.—MARY P.

WE have seen them so grown in living rooms. They cannot be sown too soon for Winter fruiting.

Early Spring Lettuce.—I sow my lettuce seed in cold frames, in November, and get plants very early in Spring. If it is sown in open ground this Fall, too late for it to germinate before Winter sets in—after the ground is properly prepared, and then early in Spring after frost is out, some fresh horse manure put on between the rows, very early and excellent lettuce can be obtained. —C. C. HOOKS.

Tomatoes for Shipping.—My experience is that the Tilden is the best shipping tomato, and I have tried various sorts. I should like the experience of others also. I do not mean that it is of the best quality, but the most productive and profitable. It has not rotted with me, though I have heard such complaints concerning it.—NEWTON MCCOMBER.

Carter's St. Osy the Best.—This was recommended to me by a gardener last Spring, but we do not find it desirable. It has ornamental foliage, but the root is tapering, divided frequently, and skin and flesh red. It is unsatisfactory, and I write you to prevent others being disappointed as I have been in it.—R. P. S., *Salem, Mass.*

Cut Worms and Cabbages.—It is too late to be of much use this season, but if your readers will remember it they can save their cabbages next season by winding a piece of paper around the cabbage stalk from the roots to the leaves at the time of transplanting and the cut worm will not cut them.—E.

The Swine-Yard.

PIG-PEN PAPERS.

Brewery Mash as Food for Swine.—Can some of your readers inform me whether the mash from a brewery is valuable for feeding pigs? Is not the husk of the grain indigestible? I can get a good supply of it; but fear to make any preparation to feed it until I have some information from experienced persons in regard to its value.—H. H., *Crawfordsville, Ind.*

Guinea Pigs.—Will some of your readers give me any information as to breeding, rearing, wintering, and general management of Guinea pigs, and greatly oblige—L. H. MYERS.

OUR friend, Col. F. D. CURTIS, has large experience, and we hope he will respond—or any one else who has practical experience.

Spaying Sow Pigs.—A correspondent asks if any of our subscribers can give him instructions how to spay sow pigs.

Swine in Iowa, according to a State law, are not to be permitted to run at large after Oct. 1, 1872.

Diary of a Ruralist.

DAILY RURAL LIFE.

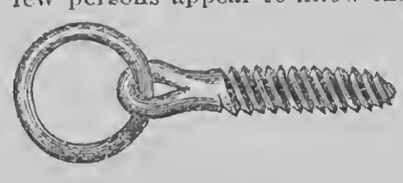
FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

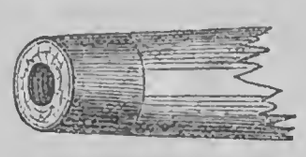
Long-Lived Beetles.—*Sept.* 25.—Last Spring I received some grape vine cuttings from a correspondent in Nebraska, which contained a number of the small cylindrical beetles known as *Bostrichus bicaudatus* of SAY; but probably better known among persons not familiar with entomological works, as the apple twig borer, as they often infest apple trees, eating into the small twigs, entering just above a bud, and after reaching the pith, boring lengthwise, making a long, cylindrical excavation. This little beetle is about three-eighths of an inch long and a sixteenth in diameter; dark, brownish-black color, the male having two little thorns projecting from the posterior end of his body. This beetle has long been known as infesting the apple tree; but I never heard of it being injurious to the grape vine until last Spring, at which time I received a number of letters from my cor-

FIG. 1.

respondents in Kansas, Missouri, and Nebraska, complaining of the damage done to their grape vines by this insect. The RURAL NEW-YORKER, June 15, page 390, advised those having infested vines to collect all the cuttings and burn them, as a sure method of preventing the increase of this pest. That, I think, was good advice, judging from what I have since learned of the habits of this beetle. I put four specimens of those received last Spring into a vial containing a section of grape vine three inches long; they immediately made an attack upon the wood, and have been feeding upon it ever since, and at this time there is nothing left of the vine but one small piece of bark; the beetles, however, are still alive, and endeavoring to make an end of the last fragment. For five months these beetles have been confined in a small vial, corked tight, and are as lively to-day, as when first put into their glass prison. To me this seems to be a most remarkable instance of longevity, for most of the beetles that are injurious to vegetation live only a few days, or weeks at most, the larva, and not the perfect insect (imago) doing the most injury. If this twig-borer lives six months, or more, as it appears to, and feeds continually during the time, it is certainly capable of doing an immense amount of injury to our vineyards and orchards. It appears to be very abundant in the States I have named, and fruit growers and farmers should do all in their power to prevent its increase, even if it cannot be wholly exterminated.

Transplanting Currants.—*Sept.* 26.—Very few persons appear to know that the





FIGS. 2 AND 3.

Fall is the best time to transplant currant and gooseberry bushes. Of course I refer to the Middle States, or wherever the currant drops its leaves before frosts occur, as it does in the latitude of New York City and southward. If the bushes are transplanted as soon as the leaves fall, new roots will be produced before cold weather, and a much stronger growth secured the following season than if this operation is deferred until Spring. Currant cuttings made and planted in early Fall will produce roots in a few days, or weeks at most, while the leaves will remain entirely dormant, and if slightly protected when the ground begins to freeze, they will not only pass through the Winter uninjured but be in the best possible condition for making a rapid growth the following season. I have tried both Fall and Spring planting of currant bushes and cuttings, the result always being greatly in favor of the former.

Sending Plants by Mail.—*Sept.* 27.—I have been packing plants to-day for some friends in California and Montana. I send them by mail, as they are small things, such as strawberries, raspberries, currants and gooseberries. Strawberry plants are probably the most delicate of all this class, still, by careful packing, they may be sent through the mails to California or Oregon, and arrive safely at destination. To pack such things that have to be inclosed in damp moss, one needs good, strong oiled paper, which can be purchased of those who make a business of manufacturing it; but the home-made article will answer just as well, and can be made for about one-half the market price. Purchase good, strong Manilla wrapping paper, in sheets 24 by 36, and give these a good coat of boiled linseed oil, then hang up where they will dry thoroughly before wanted for use, and you will

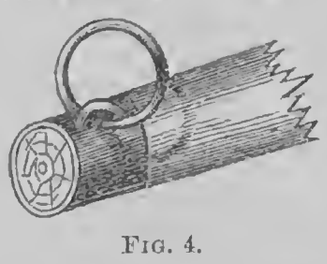


FIG. 4.

have a first-rate article in which to pack plants. I usually make up several dozen sheets at a time, hanging them upon wires stretched overhead in my workshop, where they remain until wanted for use.

I have found this oil paper a very handy article for many other purposes besides packing plants. If one is sending off any article that would be injured by moisture, inclose it in oil paper before putting it into a box, and if one is traveling a few sheets of this paper will often come into play for bringing home specimens of plants, shell fish, fruits and other things containing too much water to be safely packed among one's wardrobe. It improves with age, and is much better when two or three months old, or when well seasoned, than when first made; and this is why I endeavor to keep a supply on hand. There are some persons who think that this packing of plants to go a long distance, by mail or otherwise, is a kind of secret among dealers in such articles; but this is a great mistake, although it must be acknowledged that "practice makes perfect," and those who pay most attention to this business succeed best; that is about all there is about it of a secret nature. My mode of packing strawberry plants to go a long distance by mail is as follows:—Select the strongest and best rooted young plants, cutting off all but one or two of the smallest leaves; then take a piece of oil paper of sufficient size, a half sheet being large enough for fifty plants, which is as many as should go in one package; put a little damp moss upon the paper; upon this place a layer of the plants, then more moss, and so on in alternate layers, until all the plants are in; then roll up the package having the upper end of the plants near one edge so that they can be seen when the package is finished; for in sending plants by mail the law requires that they must be packed in such a manner that the postmasters may examine them if they choose to do so, therefore one end of the package must be left open. It is much the best way to pack strawberry plants upon which any leaves are allowed to remain, for they would soon decay if entirely excluded from the air. After inclosing the plants in oiled paper I put another wrapper of strong brown paper over all except the one end before mentioned. The address and stamp may be put upon this outside wrapper or placed upon small tags made for this purpose.

If the package is going South, the moss used should be but slightly moist, because, if too wet, the plants will soon decay. The same precaution should be used in sending out soft, succulent plants of all kinds in very warm weather. All that is required is just moisture enough to prevent wilting. Small currant, gooseberry, raspberry, and similar woody plants, can be safely sent by mail packed in the same manner. Nuts, and tree seeds of all kinds may be sent in small cloth bags, holding a pint or quart, tied with strong twine, and to this affix an ordinary paper tag, upon which put the address and postage stamps, and not try to write or affix stamps upon the cloth, as I have often seen it done, but with very poor success. There are thousands of families in the East who have friends and relatives in the far West to whom they could send many valuable plants and seeds by mail, packed in the manner I have described. From the superabundance of our gardens the pioneers in new countries should be supplied, and the cheap postage on plants makes it a very simple and easy thing to do.

Farm Economy.

NECK YOKES.

NECK yokes are constructed in various forms and from different material, suitable to the business for which they are intended. The list herewith shown and described contains all the various forms and styles deemed worthy of notice, or that I would recommend for general use, especially for the farmer.

In Fig. 1 is shown a neck yoke complete; the position of the various rings are as they appear when in actual use. Through the

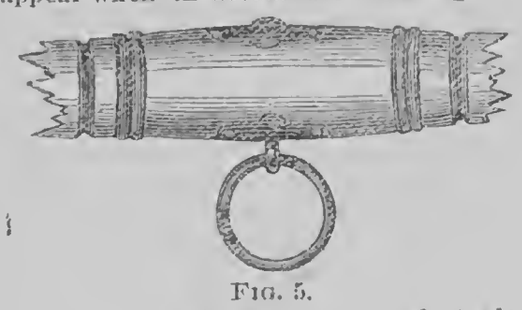

FIG. 5.

center of the yoke pass two eyed staples, riveted at their upper part as shown; in each of said eyes is a welded ring, and also through these is passed and welded a larger one, or what is denominated the tongue ring, from three to five and a-half inches in diameter. The end, or breast-strap rings, wear against the lower side of the ferrules encompassing the outer end of the yoke, as a prevention against splitting or checking by use or the elements. The

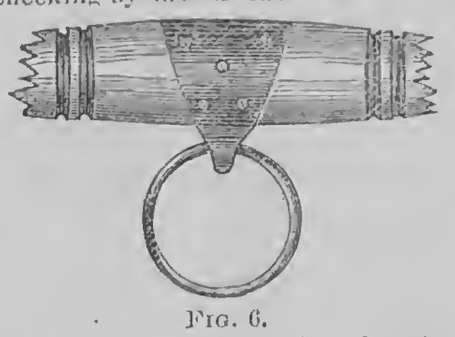

FIG. 6.

ferrules are retained in place by staples holding the rings substantially as shown. This is a very good and neat style, although somewhat complicated at its center portion; it is strong and durable.

Fig. 2 represents a threaded iron staple with ring attached; the portion with thread cut on is eight inches in length. It is screwed into the ferruled end of the yoke in Fig. 3. The advantages gained are, when one side of the staple becomes worn by the action of the ring while in use, it may be revolved one-half and the opposite side worn.

Fig. 4 also illustrates the method of attaching the breast-ring. A strip of iron is

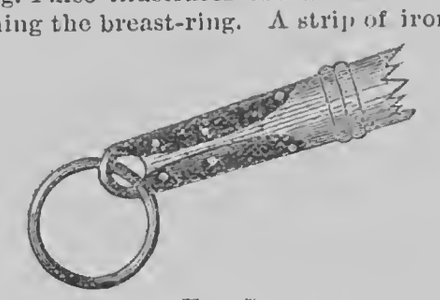

FIG. 7.

welded upon one side of the ferrule as shown; should it, by use, become worn, it can, by readjusting the ferrule, be used as in Fig. 1.

Fig. 5 exhibits another plan of attaching the tongue ring; but one staple passes through the yoke, with proper wear plates for the same, attached by nailing or with screws as is shown. It is self evident that this staple should be larger than that in Fig. 1; also should be loose enough to re-

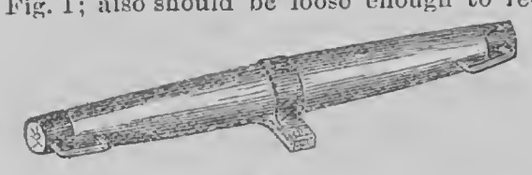

FIG. 8.

volve, as the position it will sometimes occupy will necessitate.

In Fig. 6 is shown the simplest possible plan or form of attaching the center or tongue ring. It is simply an iron clasp of a size corresponding with the dimensions of the center of the yoke over which it passes and is secured by screws; with this arrangement the wood part of the neck yoke may be small and not open to the liability of breaking as are those with a staple or staples passing through the most vital part—the center. The manner of screwing the breast-strap ring, designed especially to accompany the part shown in Fig. 6, is shown in Fig. 7. It is so clearly shown as to render a description unnecessary.

In Fig. 8 is shown a neck yoke designed especially for use upon light or pleasure vehicles. Around the center is made a groove two inches wide and one-eighth of an inch in depth, around which is placed a strip of leather, the ends connected together by sowing or riveting, and provided with a hole for the reception of the end of the tongue, or iron on end of the same. Staples are inserted at the side near each end, between which and the yoke passes a strap which, when buckled, is of a length sufficient to allow of the passage of the breast-strap; or the strap first mentioned is buckled around the lower part of the horse-collar, dispensing entirely with breast-strap.

In the foregoing I have, as far as practicable, avoided giving the size in feet and inches, the omission of which some may regret. If the exact size was here laid down for every part, and upon constructing one after that formula one should find it too small or too large and bungling to suit the particular tastes and desires, the writer would then be blamed; hence I have only given forms and mode of construction, leaving the dimensions as to size, etc., to the good judgment of the reader. L. D. S.

Industrial Machinery.

FARM IMPLEMENTS AT THE STATE FAIR.

THERE was a large number of exhibitors of farm implements at the State Fair at Elmira. We have seen larger exhibitions; but most of the latest improved farm machinery was represented. Our reporter hands us the following notes:

Horse Powers and Threshing Machines were well represented by WHEELER, MELICK & Co. of Albany, with their Ryo Thresher, Two-Horse Tread Power and Separator, etc. The St. Johnsville Ag'l Works exhibited their Bronze Medal Clover Huller and Cleaner. G. WESTINGHOUSE & Co., Schenectady, made a large display of Threshers and Horse Powers.

Mowing and Reaping Machines were represented as follows:—The Buckeye, by ADRIANCE, PLATT & Co., New York; the Clipper Mower, by the Clipper Mowing Machine Co., New York; Kirby Mower and Burdick combined, by D. M. OSBORNE & Co., Auburn, N. Y.; the Dodge, by DODGE, STEVENSON & Co., Auburn, N. Y.; Johnston Self-Raker, by Johnston Harvester Co., Brockport, N. Y.; the Young Eagle, by H. J. HERRINGTON & Co., Valley Falls; the Wood, by Walter A. Wood M. M. Co., Hoosick Falls; the Union, by NASH BROS, New York; the Sweepstakes, by C. C. BRADLEY & SON, Syracuse, N. Y.

D. M. OSBORNE & Co. exhibited their new Baltimore Self-Rake; the principal points claimed for it are the manner of striking the grain on the platform, which square at the front of the guards, operating like a reel—very simple and durable.

Hay Tedders were represented as follows:—The American, by the Ames Plow Co., Boston, Mass; the Bullard, by NASH BROS., New York; the Superior, by New York Plow Co., New York.

Miscellaneous.—Messrs. P. P. MAST & Co. exhibited their new Anderson Steamer for steaming food for stock and running light power. It is made of triple thickness of iron, and capable of bearing a pressure of from 50 to 75 pounds to the square inch. They also had on the Grounds their Buckeye Cider and Wine Press and Buckeye Grain Drill. The Phillips Corn Husker was shown by HILLS & HOAG, New York. The New Jersey Apple Grinder, by R. BUTTERWORTH, Trenton, N. J. JONES & Co., Binghamton, N. Y., exhibited their celebrated 4-Ton Platform Scale. OSGOOD & Co., Binghamton, N. Y., 4-Ton, do., with self-adjustable improvement. The Chadborn & Caldwell Mfg Co., Newburg, N. Y., brought out, for the first time, their new Pony Excelsior Lawn Mower; they also had a very fine display of hand and horse machines. The Eagle Food Steamer and Cauldron was exhibited by E. E. SILL, Rochester, N. Y. The Taylor Hay Rake, by B. C. TAYLOR, Dayton, Ohio; the Wisner Horse Hay Rake, self-dumper, by J. E. WISNER, Friendship, N. Y.; the Nishwitz Pulverizing Harrow, by J. B. NORTON, Waterville, N. Y.; the Planet Seed Drills and New Planet Cultivator (which hoes both side of the row at once), by S. L. ALLEN & Co., Philadelphia, Pa.

The Ames Plow Co. of Boston, Mass., made a fine show, exhibiting the Burt Hay Rakes, Perry Mower, Little Giant Wheel Jack, Herrington Seed Sower and Cultivator, Knox's Gang Cultivator, Boston Horse Hoe, and a fine selection of Knox's Patent Hard Steel and Cast Iron Swivel and Land Side Plows. They also showed their new Cider Mill and Press, called the National. This machine facilitates the getting out of the juice, and getting more cider from the same amount of pomace, by crushing instead of grating the apples.

The Farmer's Favorite Grain Drill was ably represented by S. N. GALLUP, Gen'l Agent for BICKFORD & HUFFMAN, Macedon, N. Y. The Coates Lock-Lever Horse Hay Rake, by NASH & BROS., New York; Bradley's Shovel Plow, Scotch Harrow, Horse Hoe, and Carhart's Pulverizing Cultivator, by C. C. BRADLEY & SON, Syracuse, N. Y.; the Double Harpoon Horse Hay Fork, by the Pennock Manufacturing Co., Kennett Square, Pa.; Gifford's Swinging Cattle Stanchion, by W. C. GIFFORD, Jamestown, N. Y. F. F. HOLBROOK & Co. exhibited their National Prize Swivel Plows, Holbrook's Drill and Cultivator, etc. J. W. MOUNT, Medina, N. Y., had a good show of Power Apple Presses and Grinders. GEO. CHAMBERLAIN & SON, Olean, N. Y., had their Stump Puller in full operation; they also exhibited their new Ditching Plow. H. J. KENT, Palmyra, N. Y., had his new Patent Sulky Potato Planter on the Grounds.

Entomological.

A RARE BEETLE WANTED.

We have received from the readers of the Rural New-Yorker who reside in the far West and Southwest many specimens of insects during the past year that were valuable additions to our cabinet. In return for these favors we have endeavored to give some interesting facts in relation to the history of these insects, and hope, with the aid of our correspondents and readers, to make the Entomological Department still more valuable in the future. There is, however, one native beetle that has not, as yet, come into our net; and for this reason we are quite anxious to obtain it. We give herewith an illustration of this insect,

natural size, in order that those who may feel inclined to aid us may be able to recognize the same if found. It is far from being a new insect to science or entomologists, for Thomas Say described it in a paper read before the Academy of Natural Science, Philadelphia, October 22, 1823. Its name is *Amblychila cylindriformis*, Say. Its body is a dark chestnut-brown, impunctured; head, blackish; mandibles very strongly toothed; elytra joined at the suture, rather paler than the thorax; irregularly marked with unequal punctures. It cannot fly, but runs rapidly along the ground.

WHERE FOUND.

Mr. Say's specimen was found in Arkansas, and it is said to occur at various places along the base of the Rocky Mountains. Capt. Pope found one on the Llano Estocado, a few years since, and Dr. Wm. A. Hammond, U. S. A., found another on the Platte River, about 100 miles above Fort Kearney. Others have been found in California; therefore it is likely to be picked up in Western Texas, Arkansas, New Mexico, or California. We have been informed that it often seeks shelter under dry buffalo droppings, and probably under flat stones, bark, or loose sods.

AN OFFER.

Any person who will send us a perfect specimen, in good order, shall receive the Rural New-Yorker for 1873, *free*. This offer will remain open until we have received fifty specimens; therefore, our readers in the regions where this beetle is likely to be found, need not fear of being too late, no matter when they send the beetle, if they happen to find one or more.

HOW TO SEND.

As soon as a beetle is caught, it should be put into alcohol or whisky, and kept there until forwarded. Then take out the specimen or specimens, and pack carefully in fine sawdust, and in a tin box; or a hole bored in a small block of wood will answer. Wrap with strong paper, and forward by mail. Other beetles from the regions of country named will also be very acceptable; therefore, persons looking for the *Amblychila* may do us a favor by collecting anything and everything in the way of insects.

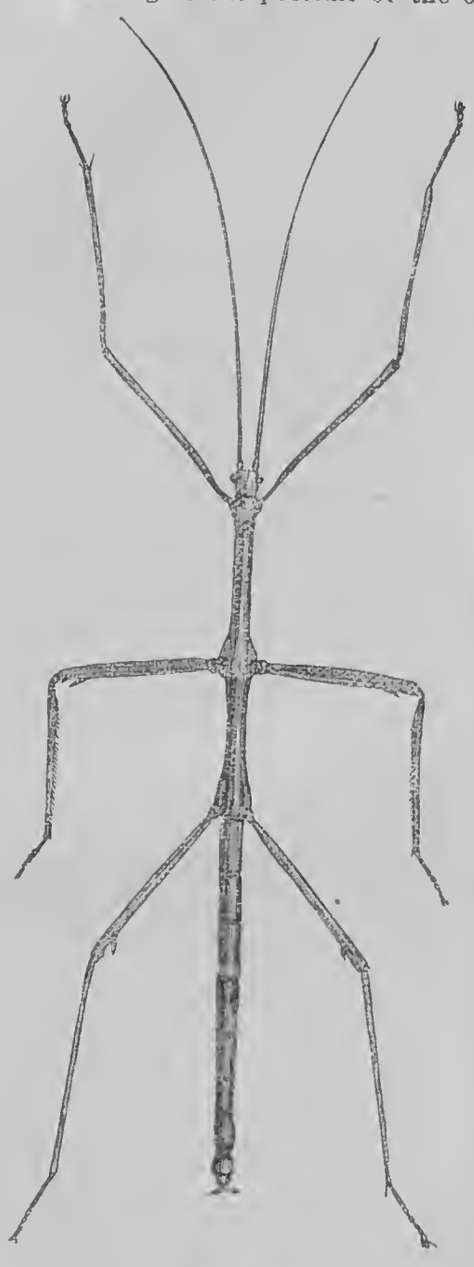
ENTOMOLOGICAL NOTES.

Butterfly Chrysalis.—Inclosed find a *little animal*, which please name. The golden spots have faded some since it was first found.—Geo. N. Thompson, *Leasburgh, N. C.*

The little animal which you send is the chrysalis of our common Archippus butterfly (*Danais Archippus*). The caterpillars live on the milkweed (*Asclepias*), and you can find them in abundance wherever this weed is common. The chrysalis is certainly one of the most beautiful things imaginable, being deep green, ornamented with golden spots and stripes of black and gold. The butterfly is very abundant and extends over a wide range of country.

Walking Stick.—The inclosed specimen I found on the bark of a Basswood tree. What is it and its name?—E. S., *Harbor Creek, Pa.*

We have received such numbers of this curious insect in the past few weeks that we herewith give the portrait of the one



you send, in order that others may recognize it and save postage, as they are far too plentiful to be of any value for our cabinet. Its name is *Diapheromera femorata*, although usually known as the "Walking Stick." Its color is green, and the common name is quite appropriate. It is perfectly harmless, except to the small insects upon which it feeds.

S. J. C., La Porte, Ind.—The insect sent is the same as the one mentioned above.

Rural Architecture.

OCTAGON DWELLING.

In the Rural New-Yorker of Aug. 17th S. H. Moon submits plans of an octagon house for improvement, and in reply I beg leave to offer the inclosed for his consideration. I have drawn plans for a house of the same size on foundation, and have endeavored to secure the following improvements upon J. H. M.'s plans, viz:—1, larger rooms and more of them; 2, more light; 3, better ventilation throughout; 4, a better outside general appearance; 5, more convenience; 6, an easier and much more convenient passage through the house from front to rear.

The roof I would build either a Mansard or nearly flat. The piazza and back stoop I would build outside of the octagon, and for these two reason, viz:—1, in order to secure more room in the house, and, 2, to improve the appearance of the same; for the house would look very much like a dove-cote on a

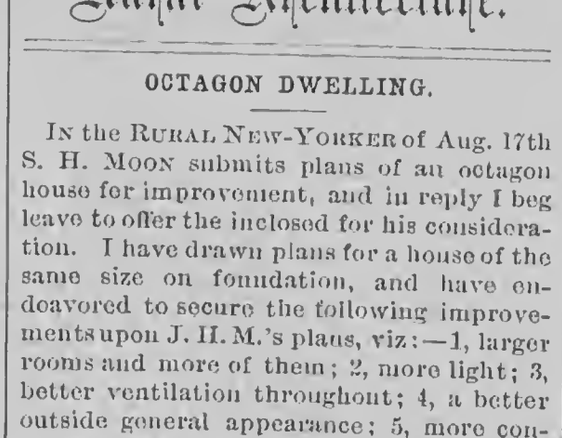


Fig. 1.—Piazza.

large scale, without something built outside of the octagon to relieve the very plain appearance it would otherwise have. The piazza may be built on one side only, or on three sides, as in the plan; but it should in any case be built light and airy—I would suggest as Fig. 1. The back stoop to be a little more than one-half inclosed, and a pantry partitioned off, leaving a stairway between pantry and the main house, as shown in plan, and thereby leaving one end and a part of the front open; to be built in same style as piazza.

There are two entrances to the cellar—one from the dining room, under the hall stairs, and one from off the back stoop. If two cellarways are not required, the one under the hall stairs could be dispensed with, and a very nice closet made in its place, opening into the dining-room. If preferable, the dining-room could be furnished as a parlor, and the parlor and back parlor used as a sitting-room and bedroom, if a bedroom

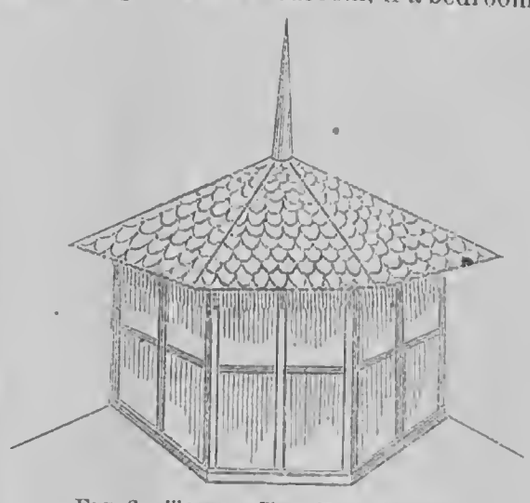

Fig. 2.—Tower, Two Feet High.

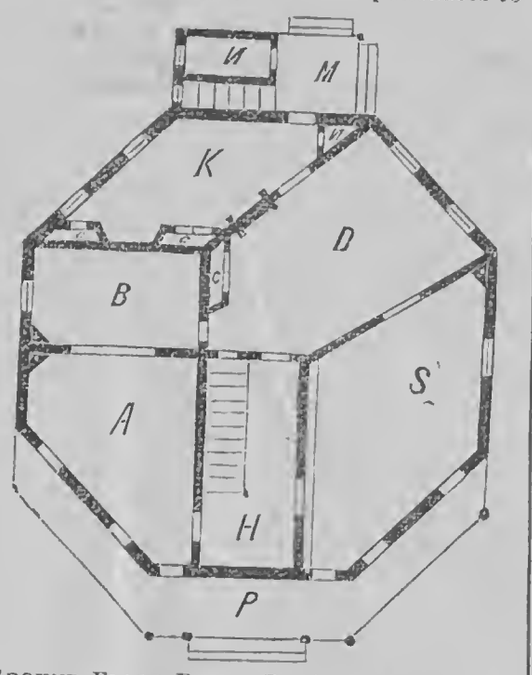
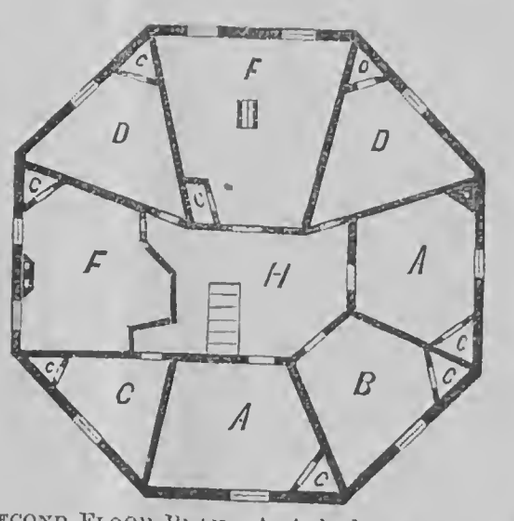
on the ground floor is desirable. A bay window could be built in the room marked parlor, which would add to it very much.

I have three chimneys, giving five flues and two fireplaces—one in the kitchen and one in the dining-room. The hall on the second floor I would light and ventilate in two ways:—First, by building over the center of the roof a bottomless tower, three feet high, with same style roof as the house, and containing windows to open and close (see Fig. 2); second, by placing a long sash over each door on the second floor, to be balanced, in order to open and close them. By these two ways, two indispensables to



Ground Floor Plan.—P, piazza, 6 ft. wide; A, front parlor, 14 by 17 ft.; B, back parlor, 8 by 15 ft.; H, hall, 6 by 17 ft.; S, sitting room, 15 by 19 ft.; D, dining room, 13 by 19 ft.; K, kitchen, 12 by 15 ft.; c, c, c, closets; M, back stoop; N, N, pantries.



Second Floor Plan.—A, A, bedrooms, 11 by 12 ft.; B, bedroom, 12 by 12 ft.; D, D, bedrooms, 10 by 12 ft.; E, bedroom, 12 by 16 ft.; F, bedroom, 12 by 13 ft.; G, clothes room, 8 by 11 ft.; H, hall, 10 by 12 ft.; C, s, closet.

health are secured—namely, light, and thorough ventilation throughout.

Any of the rooms on the second floor may be connected with doors, if desirable; and, although I have marked all but one as bedrooms, one of them could be fitted up as a bath and water-closet; another as a store-room, as might be deemed desirable or convenient. I will not trouble you with any further descriptions or suggestions at this time, and I think you will find the plans submitted sufficiently comprehensible.

W. R. S.

NOTES FOR BUILDERS.

Floors in Fire-proof Buildings.—An architect says:—"If you will have wood floors and stairs, lay a flooring of the thickest sheet iron over the joist, and your wood upon that, and sheath the stairs with the same material. A floor will not burn without a supply of air under it. Throw a dry board upon a flat pavement and kindle it as it lies, if you can. Prevent drafts, and though there will be fires, no houses will be consumed."

Land Department.

VIRGINIA ITEMS.

As the Rural New-Yorker purports to be a paper adapted to the wants of the American people, and a specialty to the farming interests thereof, items pertaining to Southern wants and resources may be acceptable to your readers. For health's sake, I have turned my face towards the South. Many, both from the North and West, would, if thoroughly informed of the climate, soil, and society of Virginia, be glad to locate here.

Virginia has unbounded facilities for mixed farming. The general face of the country is undulating. The land along the Potomac rises in a succession of ridges, affording delightful sites for residences. The bottom lands are adapted to grass, corn, etc. Timothy grown here attains a marvelous hight. Over that part of Virginia where we have traveled tilling is not difficult, nor heavy grading for highways necessary.

The destruction of timber is, to many, a very serious objection. It is truly deplorable; but all these old wood lots are set with a new growth of timber, with which some farmers are now making a good, durable post and pole fence—posts Red Cedar and poles White Oak. An enterprising farmer here says he would not have a fence on his farm. He calls fences nuisances, and says he can soil his cattle on one-half the land required to graze them.

I have never seen a country so blessed with pure, soft water. On every hill side may be found the never failing fountain bubling through the valleys below, and forming some of the finest streams in which may be seen the beautiful gold fish that adorn our aquariums in New York.

These streams ought to be thickly dotted with mills and factories to give employment to the surplus help of the poor. I know of several fine mill privileges within five miles of Washington, one with fifty acres of land with a race, can be bought for less than the race cost. There are many chances to buy valuable mill powers where the buildings have been destroyed. Some farmers secure two crops of potatoes from the same ground. Gardeners tell us they raise three crops of peas in succession yearly; this is often done in New York State, is it not?

Mr. Wm Herrington of "Bellfont," near Alexandria, Va., (formerly of Richfield, N. Y.,) seeded down twelve acre of rye to Timothy seed, and, without any fertilizing, cut the following season thirty-two tons of first-class Timothy hay. In April, 1871, he harrowed a field of Winter wheat and rye and sowed twelve quarts of clover seed per acre, and now this field is a complete mass of clover. When the wheat was sowed he used 150 lbs of bone dust to the acre. Timothy and clover attain a wonderful growth here. May not the poorest land be redeemed by seeding freely with clover?

H. M. L.

The Shenandoah Valley.—Can you inform me anything about the Shenandoah Valley in Virginia?—of its climate, soil, fruit, location and people? If so, it will greatly oblige—W. H. C., *East Gainsville, N. Y.*

It is a beautiful valley, excellent soil, and when we were there last (in 1856) we thought it one of the most beautiful regions on the continent. Will not some of our readers there respond to the above inquiry?

Soil of Washington Territory at Walla Walla.—"We have stiff, clay subsoil, covered with a black loam, light, ashy land, rich black loam, with no clay subsoil, and gravelly land, all perhaps on one acre of land, and each requires different treatment."

Domestic Economy.

ODDS AND ENDS.

Pumpkin Pies.—Will some of the RURAL's readers tell me how to make good pumpkin pies. I have tried, but they fail to please my husband. Please tell and oblige—A YOUNG HOUSEKEEPER, *Ossian, New York.*

IN response to the above we print the following, which we have just received from Mrs. B. R. SIMPSON, who says "it is an excellent recipe, for I have tried it:"—Cut the pumpkins into small pieces; take out the seeds and inside, but do not pare it. It must be a well grown and thoroughly ripened pumpkin, and not watery. Put the pieces into a saucepan, with only a few spoonfuls of water—not more than four; cover close, and let it cook gently, so as not to scorch, until the water has all evaporated, and the pumpkin has cooked quite dry, and of a rich, dark orange color. While hot, sift it through a course sieve. Season only as much as you are needing for the day. For one large pie—one egg, one tablespoonful of molasses, four tablespoonfuls of condensed milk, and enough of new milk to make it as thin as you wish—or if you have it—half milk and half cream, instead of condensed milk; sugar and spice to suit the taste. Ginger and cinnamon are very nice. Bake till a clear, rich brown, but not blister nor scorch.

To Dry Pears and Grapes.—The Hearth and Home has the following:—Take pears that are good for steaming, but too acid for eating, while uncooked; pare, quarter, and put into deep dishes, and sprinkle over with sugar—about a teacupful of sugar to a quart of fruit. Leave for twelve or fourteen hours, by which time there will be a good deal of juice in the dishes; then put them in your sweetmeat kettle and stew until nearly clear; then remove and spread upon dishes to dry in a warm but not hot oven. The juice must be poured over them.

Acid grapes are excellent treated in nearly the same way, only instead of standing over night in sugar, they must be put in the kettle to scald at first. As soon as they boil the skins will burst and the seeds rise to the top; they must then be skimmed immediately, or they will sink again among the grapes. After skimming, remove from the fire, and stir in the same preparation of sugar as for pears; spread on dishes and dry. When done, pack in stone jars.

Preserved Orange Peel.—Clean carefully; cut in thin strips; stew in water until the bitterness is extracted; drain off the water and stew again for half an hour in a sirup of sugar and water, allowing half pint of water and a pound of sugar to each pound of peel. Put it aside in jars, and keep it in a cool place. If desired, a little cinnamon and ginger may be stewed with the peel, but it is more delicate cooked simply with sugar. Lemon peel may be prepared in the same manner, either alone or mixed with orange peel. These form pleasant "relishes" eaten with cake or bread, or if chopped finely when prepared they form excellent flavoring for puddings and pies. —B. M. P.

To Clean Gold Chains.—EMMA G. CUSHING asks the RURAL NEW-YORKER how to clean gold chains the best way. We do not know the "best" way, but we know the following to be a good way, because we have tried it:—Put the chain in a small glass bottle, with warm water, a little tooth powder and some soap. Cork the bottle and shake it for a minute violently. The friction against the glass polishes the gold, and the soap and chalk extract every particle of grease and dirt from the interstices of a chain of the most intricate pattern; rinse it in clear cold water, wipe with a towel, and the polish will surprise you.

How to Cook Raisins.—Some time ago MARY G. F. asked the best way to cook raisins. This is my method:—I steam them by pouring a small quantity of boiling water among them in a tightly-closing dish, allowing them plenty of time to cook before opening the dish. For pies, cakes, puddings, etc., they should be prepared in this way. They are plumper and do not affect one's digestion.—RACHEL BARKER.

To Make Grape Jelly.—Can any of your readers tell me the *best way* to make grape jelly?—MOLLIE.

HERE is a way that is recommended as good:—Put the grapes in a jelly pan with a very little water; simmer on the fire till quite soft; then strain through a colander or flannel bag; when the juice is all run out, measure, and allow fully one pound of loaf sugar to every pint of juice; boil till it jellies; when it has boiled twenty minutes, try a little in a saucer. It should be watched for fear of boiling over. Common sugar may be used, but the jelly will not keep so long.

Rythmical Rules.—A rhymester thus verifies some rules in regard to cookery, which many cooks might commit to memory to advantage:

Roast pork, *sans* apple sauce, past doubt,
Is "Hamlet" with the Prince left out.

Broil lightly your beefsteak—to fry it
Argues contempt for Christian diet.

It gives true epicures the vapors
To see boiled mutton *minus* capers.

The cook deserves a hearty cuffing
Who serves roast fowls with tasteless stuffing.

Grate Gruyer cheese on macaroni;
Make the top crisp, but not too bony.

Floating Island.—Beat four yolks of eggs with two tablespoons of sugar; 1 teaspoon of flour; then stir into 1 quart milk and bring it to a boil, stirring it all the time; have the whites beat nicely and slip it on the top of the milk, dipping a little of it on to cook the egg; then grate nutmeg over the top; let it cool, and it is ready for the table.—M. E. S.

Domestic Inquiries.—EDNA SKINNER asks how many pounds of dried cherries can be made from one bushel of Early Richmond, with and without sugar. . . Will some of your readers give a recipe for making chow-chow?—JULIA A. POWELL.

Pomological.

POMOLOGICAL GOSSIP.

Naked-Limbed Greening of Maine.—A correspondent of the Maine Farmer says this apple has been known in Monroe, Me., forty years. It was first obtained of a man by the name of GOODALE of Ovington, or Brewer, Me. It was generally considered a New York apple, and until within a few years has borne the name of "New York Greening," and is sometimes called "Limber-twig Greening." It has also been called the "New York Pippin." The tree is described as pretty, bark very bright and smooth, limbs long, slender, and give the tree a weeping appearance; very productive. Fruit large to very large, flattish, round, rather long; stem slim; color pale green in Fall and a beautiful golden yellow in Winter. Some specimens have a red cheek in the sun, and now and then one with a russet cheek. Flavor, sub-acid, very crisp and juicy, fine-grained, with small core; splendid for eating or cooking; early Winter apple.

Princess of Wales Peach.—This is one of the many seedlings raised by that veteran pomologist of England, Mr. THOMAS RIVERS. It might appear like bringing "coals to Newcastle," to think of introducing new varieties of the peach into this country from England; but Mr. RIVERS has produced some superior sorts that do well here and compare favorably with our best varieties, as we have had not only ocular demonstration, but the testimony of our palate, for we have received from Mr. JAMES H. RICKETTS of Newburgh several specimens of Mr. RIVERS' Princess of Wales peach that are not only superb in appearance but exquisite in flavor. We think it is a variety worthy of the attention of our fruit growers.

The Mt. Vernon Pear, Major FREAS says, "turns out to come short of the glory claimed for it. In the first place it is said to possess a 'peculiar flavor which may not suit all tastes,' and that it is an early Winter, not a late Winter sort. Ripens generally in November."

Apples in Southern Minnesota.—WM. ECKELS, near Eyota, Minn., has 150 young apple trees in bearing, the orchard being surrounded on all sides by a close belt of trees. Mr. ECKLES commends the following varieties:—St. Lawrence, White Pippin, Red Astrachan, Yellow Bellflower, Sops of Wine, Perry Russet, and Fameuse.

Raspberries Bearing September 16.—PERMELIA GRISWOLD is informed that it is not at all uncommon for raspberry bushes to be in full fruit as late as October,

The Poultry Yard.

LICE ON PIGEONS.

WOULD you oblige by sending me a recipe to kill lice on pigeons? I have some very fine varieties, and they are full of lice. During the past week, seven of my finest birds became droopy, and remained so for several days, and then died. The lice is the only way I can account for their death. I was informed that grease would kill the lice, and put some on several this morning; do you think that will do any good?

Also, can you inform me where I can obtain a pair of "Satinette" pigeons, and about what would be the cost of them? Is there a book published treating of pigeons? If there is, can you inform me where it can be obtained in Baltimore?—LA FAYETTE STEWART, *Baltimore, Md.*

THE lice may be destroyed by dusting sulphur under the feathers. A little paraffin oil, or vegetable or mineral turpentine, poured on the perches, soon expels them. We cannot inform you where you can obtain the Satinettes. There is an English work on pigeons, by TEGETMIER, with colored plates of the different varieties, which we can forward you on receipt of $5. We do not know where it can be obtained in Baltimore.

POULTRY NOTES AND QUERIES.

Fattening Fowls for Market.—"Young America," wishing information as to the best mode of fattening fowls for market, I will give my plan, which is simple and effective. The fowls to be fattened should be shut up in flocks of twelve, in a light airy pen, 5 by 6 feet; feed them three times a day all they will eat (no more) on scalded horse feed. Mix with this plenty of powdered charcoal. At night throw them all the corn they will pick up. Furnish plenty of gravel and pure water, and in one week they will do for market. The yellow legged fowls will always look best when fat.—W. P. Y., *Union Co., N. J.*

African Bantams.—Master REED, Pittsburgh, Pa., writes the RURAL NEW-YORKER that he has some imported African Bantams, which he thinks "are the prettiest kind there is. They are just as black as coal, have rose combs and white ears; otherwise they look a good deal like partridges. They have even been thought to be prettier than the prettiest of our flowers. Unless the plants are very small, or the seeds are planted in newly dug up soil, they do scarcely any injury to the garden. In fact they are just the things to keep out grubs, etc."

Scientific and Useful.

SCIENTIFIC AND USEFUL NOTES.

Cistern Building.—I wish to build a cistern 16 feet deep by 10 feet across. I did intend to wall it with brick, but men here who have had some experience in cistern building tell me flat stones are better than brick. As I was about ready to go to hauling stone for it another man tells me brick is the cheapest and best—that in using flat stone it will require so much more cement and labor. Now I wish you or some one of your numerous readers, who has had long experience in that business, would tell me what to do. I can get plenty of that stone from the creek on or near my place, costing nothing but hauling. The brick will cost $7 or $8 per M., five miles from my place. I want a good, substantial cistern, cost what it will.—G. W. PORTER.

WE have used stone, and should think it cheaper, under the circumstances you give, than brick. If well laid and cemented, the cistern will be just as good (and we think better) than if brick are used.

A Hydraulic Inquiry.—I have a well 160 feet from my side-hill barn. I have put in a cement pipe, with a short piece of inch iron pipe at the well, and also at the pump. The pipe is laid on a gradual rise of about six feet in the first hundred feet, and then falls about one and a-half feet in sixty feet, to the pump, in order to get the valves below the frost. The pump passes up through the lower story to second floor. The rise in all, from water in well to the pump spout is not over twenty-one feet. I can pump the water up, but it runs back out of the pipe, from the top of the rise, to the well. Is the pipe defective? or will not water stay in an inclined pipe with that amount of rise—more than thirty-three feet—when the air is exhausted? I would like to hear, through your paper, or otherwise, from those who have experience.—G. O. S.

How to Make a Horse-Power.—Will some of the many readers of the RURAL NEW-YORKER inform me through its columns as to the best and cheapest mode of constructing a small horse-power for one or two horses, for turning a grind-stone, fanning mill, turning lathe, churning, etc.? power for running one of these machines at a time is all that is wanted.—M. N. W., *Perry, N. Y.*

"To Soften Old Putty," H. M. G. says "apply soft soap."

The Vineyard.

GRAPES IN NEW JERSEY.

IN the RURAL NEW-YORKER of Aug. 31st T. S. HUBBARD writes about the grape crop of the present season; also gives some hints about the future prospects of grape growing in Western New York. Now, I would advise persons in that vicinity who have any relish for the business (but feel somewhat discouraged) to come down here, a little below the middle of the State, where they can find a climate and soil suitable for the business and the season long enough for any of the late varieties to ripen. Concords were ripe and in the market here the 25th of August. The yield was heavy, quality and richness of flavor all that any one could reasonably desire. I have lived in Western New York 25 years; have not been here as long, but long enough to see grapes planted out and come into bearing. They have a sweet, rich flavor, I think, far superior to those grown up there. Why pay $200 an acre, more or less, for the rugged side hills of crooked Seneca and Canandaigua lakes, or along Lake Erie's boistrous shore, when you can buy land here from $25 to $40 per acre without buildings, or $30 to $70 with buildings, that will beat it all to pieces for grape growing and the work of cultivating not half what it is there, besides the pleasure of enjoying this mild climate with your families and shunning the cold, snowy winters of Western New York? The land is smooth, level or gently rolling, warm, dry soil; needs no draining. Peaches, pears and the smaller fruits do well here. Melons and sweet potatoes are raised in great abundance.

Should any think I misrepresent anything, I would like to have them come down and see for themselves. There are small vineyards in this vicinity, from one to ten acres, in bearing; one man in this county has thirty acres, I think about half in bearing. As to market, if cities make good markets, then this location must be good, being about midway between the two largest cities in the United States, with access to both by rail or water. L. S.

Tom's River, Ocean Co., N. J.

RICKETTS' SEEDLING GRAPES.

WE have frequently had occasion to refer to the many new varieties of grapes raised by JAMES A. RICKETTS of Newburgh, N. Y., and are again placed under obligations to the gentleman for a number of fine specimens, among which we notice particularly the following:

Ricketts' No. 1. A.—Hybrid between the Israella and Muscat Hamburgh; a large and handsome variety, similar in color and quality to Black Hamburgh.

No. 99. A.—Hybrid between Concord and Muscat Hamburgh. Bunch large; grape medium to large, globular, light, amber color; flavor sprightly, with some tough pulp at center, but good; a very showy variety.

No. 12. A.—Hybrid of Hartford Prolific and Muscat Hamburgh. Bunch small and loose; berry oval, and about the same size and color as Concord; flesh tender, sweet, and exceedingly rich, with a delicious, perfumed flavor.

No. 13. A.—Hybrid of Clinton and Muscat. Bunch medium, compact; berry small, round, green, becoming amber in the sun; flesh tender, sweet, and rich. A superb variety.

No. 72. B.—Hybrid of Hartford of Leuingham Muscat. Bunch small, loose; berry medium, round, black; pulp somewhat tough at the center, but in quality we consider it good to very good.

Mr. RICKETTS has certainly won laurels for himself in producing so many excellent hybrids, and we hope he will obtain something more substantial than fame as a reward for his labors.

Modes and Manners.

ARRANGING THE HAIR.

A WRITER in St. Pauls has furnished the following hints and opinions upon this important subject to ladies:—We are often annoyed by the incapacity to see what is becoming to the face, or the reverse, as well as the utter disregard of anatomy, evinced by the *perruquiers* and their pitiably blind and thoughtless victim. Worse than the stupid sheep that lights to follow its fellows to the slaughter-house, when a means of escape offers itself in another direction, is the woman who, never having studied any rules of art, wastes or deforms the personal advantages nature may have bestowed upon her, by following a fashion which is unsuited to her, because it is the fashion. When the style, beautiful and simple in itself, but usually most trying to the English face, of wearing all the hair scraped back, and bound into a circle of close plaits behind, came in, ten years ago, every woman discarded the slovenly net that had been ruining the backs of her dresses for two years, and scraped her hair tight to her skull. She was right to discard the net; but she was mad to force the classic style upon herself, *bon gre, mal gre.* The consequence was obvious; hardly one woman in ten looked fit to be seen; for the head must be exceptionally fine, the features exceptionally regular, that can stand this treatment. Let every woman study her face before she dresses her hair, as she studies her feet before she buys her boots.

If she finds her forehead narrowing above the cheek bone, let her never fail to insert pads in her hair at the side. If it be a broad forehead, while her face is narrow, let her avoid this style rigidly, whatever be the fashion. If her head is slightly flat, plaits across it, or the hair turned over a cushion, are the only alternatives; but if naturally too high, let her give the fullness of hair to other parts. If the head be perfect in shape, still let her disregard the fashion, and make a point of showing a charm that is exceedingly rare. It would be simply waste and ruin to pad it into all sorts of shape.

One word against the huge bundles of false hair now worn. Far be it from me to over-condemn the practice of wearing false hair. This fashion will never go out while hair is considered a "glory" to a woman, and while, through age and other causes, the glory is liable to become "Ichabod," and to fall off.

Moreover, there are cases (since caps are not in use) in which a few bands of extra tresses are more than an improvement, even a necessity; witness a very scanty supply of hair, or hair in patches, on a young head. And the practice is *not* a dirty one, as has been unjustly asserted, any more than wearing one's own hair. Besides, if one is careful and patient enough to collect it, one need never wear anything but one's own hair.

But, O, woman! beware of piling on your head a greater mass of hair than a human head is able to grow. The huge plaits of three, stuffed and padded, which are so *obviously* artificial; the mighty cables, half as thick as one's arm, that rise up aloft, and swell out behind, till the effect of them, merely as a burden, not a beauty, is quite painful to the eye, in addition to rows of ringlets, which, in themselves, would require the whole head of hair to form them; these debased fashions are a few of the many that detract from the beauty of the head and face, instead of enhancing it, imposed by foolish women on themselves. The eye soon becomes vitiated, and does not perceive, in fact, the vulgar and painful effect that is instantly apparent to another.

QUESTION OF ETIQUETTE.

"A YOUNG READER" asks the following questions:

1. "When one meets an elderly gentleman or lady from 45 to 70 years old, is it one's place to speak or bow, or is it theirs?"

It is always proper and polite to bow deferentially to a man or woman older than yourself, without waiting for recognition; but it is etiquette to wait for such persons to speak first unless one has a special message to communicate, or is very intimately acquainted.

2. "When a gentleman takes a young lady to supper, which arm should he give her—the right or left?"

The left is usually given; but it is not an important point in etiquette. If the gentleman happens to be deaf in his left ear, he should give her his right arm; also if the lady's right eye is imperfect. There is no rule which circumstances do not modify.

3. "When at the table and one is requested to pass anything, should it be to the right or the left?"

If the host or hostess does not specify to whom the article should be passed, the gentleman should serve first the lady who accompanies him; in the absence of any such companion, to the lady nearest him, whether to the right or left.

4. "When one meets a young lady, is it or is it not the gentleman's place to speak first?"

It is the lady's place to give the gentleman recognition before he speaks, unless she should happen to be an intimate friend, when he may presume to speak on the strength of such friendship. But where there is only a formal acquaintance it is regarded as politely deferential to await recognition and speech by the lady before speaking to her.

Fashions for Fall and Winter.

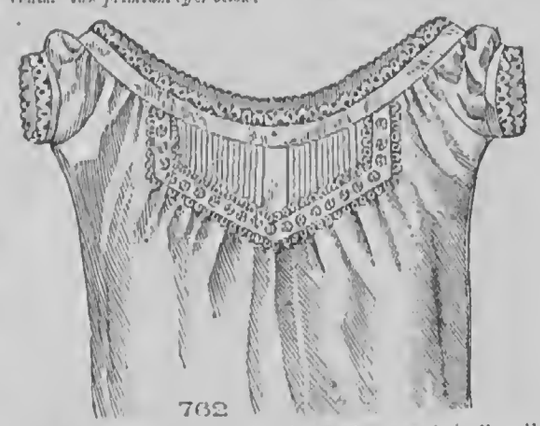
1170

GODIVA. This Polonaise is one of our latest Paris Novelties. It contains many new and very valuable features. Without looping it can be worn as a long light duster basquine, or looped (as shown in cut) it is a most elegant Polonaise. The ornamental back piece passes over the shoulders and forms a neat vest cape in front and is "adjustable;" may be worn or not as fancy dictates, thus constituting two entirely different Polonaise in appearance. The back piece is sometimes made in velvet or satin, and richly trimmed, and completes a brilliant toilet when worn with a house dress. Besides its beautiful variations it is well adapted to any material. Takes six yards of 24 inch goods. Price of pattern with cloth model ONE DOLLAR. See PREMIUM OFFER below.

1163

NEW FALL WRAP, is a sacque and cape, with a thibble box-pleat laid on the under side to the back, and in place of the broad plait of last season; just the three edges are visible from each side, giving the appearance of six round folds, the cape slopes gracefully to the back, and is left open to trim. The sacque has a large sleeve, which can be used or not, as weather or comfort demand.

We give this as one of the very best for fall and winter cloak made in either velvet or cloth. The original is of dark blue ladies' cloth. Scolloped and bound with velvet and velvet buttons. Takes three yards of ladies' cloth. Pattern, with cloth model, 50 cents. *See premium offer below.*



762

PRESTO. Chemise for lady. Its great success in leading all other styles is owing to its perfect fitting hand and sleeve. The curved arm-size is an improvement of *much* value, as it will not *cut* the shoulder or *bend* the arm, and also avoids the homely, perplexing gusset. Takes three yards linen for medium-size. Pattern, with cloth model, 25 cents. See Premium below.

We give a CLOTH MODEL with each pattern which SHOWS every seam, pleat, gather, loop, etc., how to put the garment together by the pattern, and how it will look when completed. By the use of our Cloth Models any person who can sew can FINISH the most difficult garment as easily as the plainest. They are PERFECT GUIDES.

Premium Offer!

If you write the following, viz.:

[RURAL, 1170, 1163, 762,]

RURAL NOTES AND QUERIES.

The New York State Fair at Elmira, last week—was fairly creditable; not remarkable as an exhibition. And it seems to have attracted the attention of the people to only a moderate extent as compared with previous Fairs, the receipts reaching between $14,000 and $15,000 only. It may have fully met the expectations of the managers, however, for we have heard no complaint. Elsewhere we refer to Agricultural Implements and Machinery exhibited. The exhibition of Fruits and Flowers was quite up to the average; of Cattle, Sheep and Swine, excellent, as usual; of Poultry, poor; and there was the usual exhibition of miscellaneous articles—just such as everybody has seen these twenty years, and of which want of space forbids us to talk further about.

Assorting Farm Products.—N. R. G., a young farmer who writes that he "wants to begin right in the marketing of what he produces," and asks for advice, is urged to adopt the following rules:

1. Grade all products sold as of first, second and third quality.

2. Sell for first quality only that which is "A No. 1;" and strive to make all your products reach that grade.

3. Put your name and address on all packages, so that if they are found just as represented your name will be associated with them. This will help make for you a reputation.

4. Never allow a poor article to go off your farm with your name attached, unless with a true statement of its quality.

5. Remember that it is cheaper to buy the best, do all things in the best way, and profitable to be known as producing and selling the best—that it is just as valuable to you that a customer finds that what you say is second or third class is so, as to find you tell the truth when you brand your produce as first class. Labor to get an honest name in market, and, that gained, you will have a passport to prosperity and wealth, provided you are strictly vigilant in guarding it.

"Pleasure and Profits of Industry."—On page 32, RURAL NEW-YORKER, July 13, under this head, we stated what one man had done on a small place, and the amount of money he had expended upon it, all *earned* (aided, of course, by that of men whom he employed and paid) by his own labor." Now, a correspondent writes concerning our statement, that when it was read to others "it was decided to be 'untruthful,' 'impossible,' 'don't believe it,' etc." And he would like "to have the gentleman explain how he made, upon such a small place, in eight years, with only $75 in cash, $25,000." This inquiry indicates how carelessly some people read, and how recklessly they draw inferences. We did not say this man had made $25,000 on his place; we said he had *expended* it, and had *earned* it by his own labor! The story of *how* he earned it would be a long and very interesting one, if he chose to tell it, which we doubt if he would do. We may summarize his method briefly:—1. He was industrious; 2, he turned everything to the utmost account; 3, he made his place produce the largest amount possible of that which would sell quickest and for the most money—plants, fruits, flowers, evergreens, vegetables, bulbs, etc.; 4, he never hired anything done which he could do better and cheaper himself, whether it was cutting stone, building outbuildings, painting them, potting plants, grafting, budding, transplanting, etc.; 5, he earned a good round sum every year by writing of what he knew for books and papers; 6, he lived well, but within his means; 7, he minded his own business, watched over it, and kept it moving and accumulating. In this way he earned all he expended on his place, and has a fair bank account to-day. We did not write a word that was untruthful, nor state a fact that is impossible; whether our readers believe it or not is another matter. They can do as they choose about it. We may add that the gentleman referred to never made a dollar (he says) in his life by speculation—he earned it.

The Kentucky State Convention of Short-Horn Breeders has approved the National Convention of Short-Horn Breeders called at Indianapolis, Nov. 27, and have appointed the following delegates thereto:

Wm. Warfield, Wm. H. Richardson, W. T. Hughes, J. G. Kinnaird, and C. W. Innes, of Fayette county; L. D. Offutt, W. H. Graves and M. Polk, of Scott county; E. G. Bedford, James Hall, G. M. Bedford, B. F. Bedford, B. J. Clay and J. E. Suddath of Bourbon; J. W. Prewitt, A. Vanmeter, Lewis Hampton, Ben. F. Vanmeter, of Clarke county; A. J. Alexander, Jno. M. Vanmeter, of Woodford county; T. J. McGibbon, Gen. L. Desha, Levi Patterson of Harrison county; Johnson Young and James Biggerstaff, of Montgomery county; Henry Smoot and W. W. Baldwin, of Mason county; W. H. Hall, W. L. Waddy, of Shelby county; Wm. Tarleton, of Oldham county; J. C. Jenkins and Lewis Conor, of Boone county; Walter Handy, Jessamine; W. W. Goddard, of Mercer county; J. B. Briggs, Russellville, Ky.; E. L. Davidson, of Washington county; Geo. Phillips, of Marion county; J. P. Fisher and John Owsley, of Boyle county; W. O. Chenault and W. M. Irvine, of Madison county, and all other Short-Horn breeders of this State who may find it convenient to attend.

The following resolutions were also adopted by the Convention:

Resolved, That we would urge upon the attention of the National Convention the great importance of a thorough reformation in the present American Herd Book, and that such action shall be taken as will lead either to that result or the publication of a new work.

Resolved, That we would suggest the propriety of a permanent organization of breeders, to meet annually, and that standing committees be appointed whose duty it shall be to look into all matters connected with the great interests with which we are connected.

Baby Shows at Fairs.—Too late to give answer to the important question propounded, comes to our notice a letter from Canada asserting that they propose a baby show at a Fair (Oct. 1 and 2), and asking how the babies shall be classified. We are sorry we could not have made the valuable information in our possession available to our correspondent. But, lest we may be again asked for similar information, we place our classification on record:—1st. Babies less than six months old; over six months and under one year; over one and under two years. 2d. Healthy babies and babies that are not healthy. 3d. Babies that cry least and those that cry most and loudest. 4th. The homeliest babes of good-looking mothers. 5th. The handsomest babes of homely mothers. 6th. The babes that require the least care. 7th. The babe which exacts or attracts the most attention. 8th. The babe that never wants to touch anything. 9th. A sweepstakes premium for the babe of any age, size or sex that receives the most kisses from the first 100 mothers who may pass before the competitors. We think this classification complete enough, although it might be much extended.

Emigration of English Laborers.—There is an effort making on the part of the Agricultural Laborers' Union of Great Britain to "initiate measures for the systematic emigration of the surplus population" of that country—not simply to the United States, but to the "colonial dependencies" of the British Government. It is proposed to provide laborers with a free passage to the colonies. Lord WALSINGHAM, who has recently returned to England from the United States, is reported as deprecating "rash emigration on the part of agricultural laborers, although he admitted that every workingman had a right to dispose of his labor to the best advantage." So it seems that agricultural laborers in England regard it a benefit to get rid of the surplus of labor which now depreciates the rate of wages there; the employers doubtless have not the same zeal in this direction. But the colonial dependencies and the United States can give such surplus work enough, if they will devote their attention to agriculture.

A New Illinois Industrial School.—Some years ago we met Mr. THOMAS JUDD of Sugar Grove, Ill., the owner of a beautiful farm in one of the finest counties of that beautiful State. He was then full of progressive notions about agricultural schools; and we saw that those notions would sometime crystalize into something practical. We see now that it is announced that he has nearly completed arrangements for opening next Spring an Industrial College in his town, the course of study to include agriculture, horticulture, geology, botany, zoology, chemistry, etc. The school is to be open to women, and will embrace in its course the science of cookery, and such studies as will fit the woman for the management of the household.

Ohio Delegates to the National Swine-Breeders' Convention.—At the recent Ohio State Fair the Ohio Swine-breeders named the following delegates to attend the National Swine-breeders' Convention, at Indianapolis, Nov. 20:

On Berkshires, G. W. BYERS, Nevada, Wyandot county; on Chester White, D. MCCLINTOCK, Solon, Cuyohoga county; Poland China, J. S. MARSHALL, Monroe, Butler county; short-faced Lancashires, Suffolks and other small white English breeds, M. H. CRYER, Salem, Columbiana county; and Yorkshires, Lancashires and other large English breeds, J. W. WILCOX, Salem, Columbiana county. Delegate at large, J. M. MILLIKIN, Butler county. It was on motion decided that in case any delegate should be unable to attend the Convention he shall have the power to appoint a substitute.

New York Delegates to the National Swine Breeder's Convention.—A Convention of Swine-breeders was held at Elmira during the State Fair and the following delegates to the National Swine Breeder's Convention at Indianapolis, Nov. 20, were chosen:

Delegates were chosen as follows: Wm. Crozier, Northport, N. Y., Berkshire; A. C. Clark, Brookfield Mission, Improved Cheshire; Joseph Harris, Rochester, Essex; Col. M. C. Weld, 187 Water street, New York, Neopolitan; Geo. Collins, Henderson, N. Y., Poland China; Wm. B. Dinsmore, Staatsburg, N. Y., Suffolk; J. F. Converse, Woodville, N. Y., Yorkshire; G. G. Maxon, Schenectady, Victoria; F. D. Curtis, Delegate-at-Large, Charlton, N. Y.

Road Convention in Baltimore.—We notice that a Road Convention of land owners, farmers, property holders, and other persons interested in the improvement of public roads, is called at Baltimore, Oct. 10. We mention it not because this notice will reach any one in time for him to attend the Convention, but to call the attention of our readers in other States to the importance and usefulness of such conventions as a means of permanently enhancing the value of landed property by systematic road improvements.

Horse Thieving in the Hudson River Counties, notwithstanding the existence of Anti-Horse-Thieving Associations, continues and is increasing. We do not advocate mob-law where there is any effective enforcement of existing laws; but we have known excellent results to follow wholesome hanging of horse thieves by Vigilance Committees. We wonder how it would work on the Hudson river?

AMONG THE OHIO FAIRS.

I SPENT all the month of September among the principal Agricultural Exhibitions in Ohio, and now that they are over I have taken the course of the Summer birds to the southward and made my first stopping place at the great Industrial Exhibition in Cincinnati—intending to go on to Louisville, Nashville and Atlanta.

In my way across the State of Ohio, I noticed the great crop of corn which has ripened for the harvest—the largest and best, I think, which the State has ever produced. Throughout all the clover-producing regions there is now being gathered a very large crop of seed clover. Apples are superabundant, and potatoes are not plenty. In the lower valley of the Miami a large crop of tobacco has been gathered and is now safely under the sheds in process of drying.

Speaking of the Agricultural Fairs, this Fall—every week in September had its rain storm—a sort of intermittent equinoctial, which damped off the Fairs considerably, otherwise they were of average interest; but I am sorry to feel obliged to say that the interest is mainly in the *social* benefits to be derived from such opportunities. In some of the local exhibitions there was a fair show of agricultural products, and in the larger State and District Fairs the enterprising mechanics and manufacturers advertised themselves by the exhibition of their implements, which is very right; but at all our Fairs it is only an agricultural horse trot that can beget a genuine enthusiasm!

The Local Fairs do good, any how, by bringing the people together and cultivating the graces of social intercourse. I wish the other lessons to be learned there were of equal benefit. But as to the great State Exhibitions, which are attended with so much expense and discomfort, it is a serious question in my mind whether they pay.

The Cincinnati Industrial Exhibition has been in progress a month, and closes this week. I told you what a big thing it was last year; this time it is a good deal bigger thing than it was then. Four acres under cover, and every table, stand, shelf, alcove, gallery, wall, garden plot, nook and corner filled with the choicest productions of the mineral, vegetable, mechanical and manufacturing world—showing the genius of industry, skill, art and invention in all departments of life and occupation. Thousands upon thousands of delighted visitors have thronged these beautiful and instructive walks, every day where they can be safe from storms, and with ease and comfort can come and go at their leisure and see everything at best advantage. For a complete, harmonious and popular exhibition, nothing on this Continent compares with this one at Cincinnati. S. D. H.

RURAL BREVITIES.

A CONVENTION of Farmers' Clubs is to be held at Kewanee, Ill., Oct. 16.

THE Kansas Farmer says there are plenty of gypsum beds in that State.

THE bee keepers of Michigan have resolved to petition the State Legislature for the appointment of a State Entomologist.

C. H. ASKS some one to inform him where a "thribble-joyed broom press" can be obtained—one that makes an oval flat broom.

A READER, Norwich, Ohio, is informed that the paper he names is published in London, Eng. We do not know the exact address.

IT is now Spring time in Australia. It began August 20. Summer begins November 20; Autumn, February 20; Winter, May 20.

JULIA A. POWELL is informed that the firms about which she inquires have, each of them, a good business reputation, and are deemed reliable.

OUR correspondent who asks us to name the best text-book on astronomy, is informed that we cannot, because we do not know which is "best."

The Traveler.

OUR EUROPEAN LETTER.

Crossing the English Channel.

Poissy, France, Sept. 7, 1872.

If the English Channel were a thousand times wider than it is, the difference between the inhabitants of England and France could hardly be greater than now. Nature herself in this dividing gulf, seems to protest in one endless flow of angry, turbulent speech, against a fraternal bond between the two lands. The channel, spiteful and revengeful, seems to have imbibed the rancor, hate and envy of centuries. Cross it when you may, you will not be apt to write the record in red letters. We crossed from New Haven to Dieppe in the night, and had a smooth voyage of six hours. But whether from total depravity or a sense of marine duty, every inmate of the ladies' saloon became "deathly sea-sick" before we were half way over—except myself. But sea-sickness would hardly have been worse than the torture I endured from sights and sounds and smells. My only salvation was a port-hole, and that played me false. It invited the sea to come in, and it came and embraced me with a barrel or so of tears.

In Dieppe.

We reached Dieppe at the unpoetical hour of 4 o'clock in the morning. Upon reaching the steamer's deck, whom should we find complacently regarding the harbor through the mist, but an American acquaintance, wearing the conventional stove pipe hat, which all Americans abroad wear from fear of being taken for a "Commercial Traveler." Our cultivated countryman, speaking French "like a native," and being, fortunately for us, one of the few men who are a help and a comfort instead of the reverse, proved a most agreeable addition to our party of two damsels in doing Dieppe.

Fresh from the brilliancy and neatness of Brighton, we found the antiquity, filth and somberness of Dieppe too much of a change to be specially enjoyed. I do not object to quaint old things, but I have an ineradicable antipathy to dirt, and especially to French dirt. Sewers ran through the narrow, stone-paved streets, and mold and moss draped the roofs and walls of the gray stone buildings. Every other shop we found to be a place for the sale of ivory articles, carved in the most exquisite manner. The Cathedral, old as Methusaleh, was ornate with "flying buttresses." As flying buttresses still keep us company, and are a perpetual source of wonder and astonishment, I shall not be content to pass them by without a special description. And yet, alas! they cannot be described. But imagine, if you can, beams of stone protruding from the various sides of a church roof, the projections carved in forms to simulate the most demonish "beast or woman, ghoul or human," with angry mouths snapping at you, and yet with an attitude and expression as if the beasts were in the agonies of colic, and you may form a crude opinion of ecclesiastical architecture in France.

Everybody who visits Dieppe is supposed to do so for the sake of sea bathing; and the bathing neighborhood is the pleasantest part of the town. The streets near it are clean, the hotels bright and wholesome, the shops attractive, and the accommodations for lounging excellent. The bath houses are small frames covered with linen canvas. The occupant is carried in them to the water's edge and back if desired, and men bathers are abundant who look after the women and children in the surf.

At Rouen.

We left Dieppe in time to spend Sunday in Rouen, which city we found to be the incarnation of greatness and elegance. A statue of Corneille reminded us that it was his birth place; a street and boulevard named for Jeanne D'Arc recalled the unhappy fact of the city being also the place of her martyrdom. One might live forever in Rouen and be happy, if sea and river, gardens, flowers, magnificent churches, and the wholesome hum of industry yield content. But the Sabbath in France and the same day in America are widely different. Here shops are open, looms spin and weave, traffic and trade are indulged in the same as upon any other day. Sunday is just like Monday. People go to church, say mass, cross themselves with "holy water" and return to their shops. The churches are always open—as indeed they should be everywhere—so that upon any and every day, and at any hour one can enter for worship or prayer. The supreme feature of that Sunday at Rouen was the ascent of a balloon which gave the city the appearance of the Judgment Day The long bridge over the Seine, the streets and the river shore were black with people gazing heavenward.

INFANCY—FROM THE PICTURE BY SIR JOSHUA REYNOLDS.

A Frenchman's Views.

During my stay in Rouen I was attacked, conversationally, by a French gentleman of marked intelligence, who spoke English tolerably well, and who was a brother-in-law to one of the most delightful, as well as profound French authors. He declared Victor Hugo to be a snob, an inciter of disturbances, and Louis Blanc a man without brains. He said the general opinion of Americans in France was that the former always went armed, and that if any one dared to histle or do anything offensive, he was at once brought *vis a vis* to a revolver and requested to stop or yield his life. His opinion of American politics and politicians was equally amusing. An American politician he fancied to be a man without moral principle, without social position, possessing a low sort of cunning, and who accepted an election to Congress as the natural result of his depraved condition—an opinion which I was forced to confess was not far from the truth. He confessed to liking Americans very much, but thought of all the wild things in the world, the fact of two unattended young women "doing" Europe was the wildest, as Europe was not America; and of all the Lord's creation the one thing to be guarded against was a Frenchman! I expressed surprise at his opinion of his countrymen, but he only reiterated his statement which, coupled with what I have been told by others, would, if I were not the strongest minded and strongest hearted of women, fill me with fear and incline me to flee this villainous land at once. But as yet I have no such intention; and as I usually go armed with an umbrella, Sally Brass fashion, and have sufficient command of one tongue and two languages to rid myself of everything animate, except French fleas, my faith remains unabated.

Poissy

Is a very old town, of four or five thousand inhabitants. It is an hour's ride or less from Paris, and the people are entirely composed of the peasant and middle classes. We have been here nearly a fortnight, resting, studying and observing the habits and manners of the domestic life of the people about us. As it is thoroughly French in all of its characteristics, and its nearness to Paris giving it relative importance, a picture of Poissy gives one a correct view of life everywhere in Normandy. Upon arriving here we went at once to the best hotel, kept by a woman. French women, by the way, are vastly ahead of their American sisters in filling business offices. We buy railway tickets, dry goods, boots and shoes, crockery, hardware, groceries, farm produce, etc., of women, settle hotel bills with, and send telegrams and letters through offices, manned by women. We found our landlady a handsome young woman with an air of the most perfect taste and neatness, from her stylishly coiffured hair to the ends of her French slippers, including her snowy petticoat with its border of fluted cambric. She showed us one apartment after another, all filthy beyond anything I have ever seen in America. As we could do no better that night, we concluded to choose the least evil of the evils. We went down to dinner, found small tables, snowy napery, immense damask napkins, a most polite attendant, and a very good dinner.

Cost of Living.

The next day we investigated the town for clean apartments and had the guidance of Providence. We engaged a suite of three rooms, completely furnished for two francs (forty cts.) a day. The floors are of painted brick, with a large mat in the center, and other smaller ones in front of large pieces of furniture. One room is a complete kitchen with all arrangements for the cuisine, and had we need of fire we should do our own cooking. As it is, our hostess sends up our breakfast, we furnish our own luncheon and go to the hotel for dinner. Everywhere in France we pay for what we have, except at the *table d'hote*, which is a dinner of eight or ten courses, beginning at a fixed hour, with the people seated about long tables. Here at Poissy, which is a town too small for *table d'hote*, we pay for bread, 8 cents; bottle of wine, 20 cents; butter, 10 cents; vegetables, (potatoes or beans) 16 cents; artichoke, 10 cents; fried fish, (tiny fish, about the size of one's little finger, eaten head and tail,) 60 cents; mutton cutlet, 30 cents; roast beef, 40 cents; soup, 12 cents; mushrooms, 16 cents; salad, 12 cents—the foregoing for two. An excellent peach or pear costs four or five cents; a quart of milk four cents.

A French lady laughed heartily upon being told of what an American breakfast consists. The French have two breakfasts, one soon after rising, and the other at noon, which is the *dijeuner a' la fourchette* (breakfast with fork) and consists of a moderate repast of eggs, or meat and vegetables. The early breakfast consists of coffee, or chocolate and bread, and may be partaken of in one's sleeping room, in the garden or dining room. A gill of coffee, which is black as ink, but perfectly clear, suffices for a number of persons. From a large pitcher one pours hot, cooked milk into bowls, which are supplied with table spoons. To this is added a little of the black coffee, which is cold, sugar if you like, and which constitutes *cafe'-au-lait*. The sugar, made of beets, is manufactured in oblong pieces and is very nice. Bread in shape of the American loaf is quite unknown. There are the long loaves, a yard long and but three or four inches in diameter, and the short, slender loaf, or the small, round loaf, large enough to constitute a breakfast for one person. Butter comes to market entirely fresh, and one adds salt to suit the taste as he eats it. It is made fresh every day or two.

The French Dinner.

The meal of the day, is served late, from six to nine o'clock. At this meal wine is the only beverage. Everybody drinks it. To drink a glass of water is an event. Ice water is unknown. Butter is rarely used at early breakfast or dinner. Bread is broken instead of being cut—broken with the fingers into size suitable for the mouth—dispensing with the habit of biting it off with the teeth. I never ate in America fried potatoes equal to such as we have here. During a fete held here a few days ago I observed the process in one of the bazaars. There were pots of fat (lard) intensely hot, hanging over fire; near by sat a man peeling and slicing potatoes. These slices, the thickness of ordinary pasteboard, were thrown in the fat, and presently skimmed out as light and fluffy as French pastry; of course eaten hot. The secret, if any, lies in the hotness of the fat.

French Buildings and Gardens.

As everything in France is built of stone, and built for all time, the majority of the houses are old, and, externally, present a gray, and rather forbidding aspect. One sees nothing of the liveliness and freshness of white houses with green blinds, and gardens smiling through open fences. Here the house and garden are everywhere inclosed in high stone walls of solid masonry. A gate of iron bars affords you the only glimpse of the interior. This makes every village a walled town. But forbidding as the outside may be, or tantalizing as it may be, with the luxurious vines tumbling over streetward, the inside is glorious. So everybody lives in the garden, eats, reads, sews and receives her friend in her garden. Thus far I have desired nothing so much as to show every American farmer or land owner the beauty, and especially the use of the French garden. One is as retired in the garden as the house. The parlor opens into it. There are tables of painted iron; footstools, chairs and benches the rain cannot damage. There is a well in the center. At one side a house for garden tools. Studios of brick have been built in the corners to gratify the use or fancy of various members of the family. There are a few large trees, which, with the wall and house, always furnish abundant shade. On the wall are trained not only ornamental vines and grape vines, but peach, pear and plum trees—now loaded with fruit. The garden comprises everything—all kinds of fruit, beds of vegetables, garden sauce, flower beds bordered with Box, Violets or Polyanthus; there are clumps of Lilacs, mounds of snowy Clematis, spikes of scarlet Gladiolus, rose trees full of Roses, boxes of house plants, vases of Asters or Cacti. Of course such a garden is not made in a day, but as I sit in one as I write—an earthly Paradise—I feel like exclaiming with the Methodist preachers in a revival, "Oh! why longer delay!"

Let me take you into the parlor. It is a small room. Everything is neighborly. The floor of inlaid wood is waxed. There are bright mats here and there. The seats are low—no two alike. The upholstering is in Summer attire, all under snow-white linen covers, with narrow ruffles at the seams, which the laundress has fluted. In the Winter the covering is gaily-flowered chintz. There is a cabinet (upright) piano. I have not seen a square piano in France. There are a few prints on the wall, but you hardly observe anything but the quantities of flowers everywhere. On the center table are Asters in luxuriant bloom. The pot in which they grow is placed inside a large ornamental vase, and the space between is filled around with clumps of cut flowers. Oblong boxes of Asters, Zinnias, Begonias, or Pansies, sheathed in clean paper cases, or hidden in ornamental boxes, stand on mantels, tables, or brackets, or hang in the windows. Magnificent boquets of Dahlias, double Hollyhocks and double Sunflowers are massed in their bold beauty in a corner. There are no satin sofas, velvet carpets or tawdry pictures. But the place is heavenly, and but few too poor to have one like it. Wherever one turns, no matter how dirty the street or alley, or poor and dirty the houses, the windows will be full of flowers, flowers everywhere. The French have no Sabbath—God pity them! but they have flowers—God bless them!

French Farming

has its peculiarities. From Rouen to Poissy the country, agriculturally, is magnificent. France has not the stiffness and primness of England. Everything seems done with a view to effect. Forests are trimmed. Trees are left standing or are planted in rows. For miles a fence was not to be seen, save the hedge rows each side of

the railway. There would be sections, usually in the shape of a parallelogram, not large, of wheat, of oats, of beans, potatoes, etc., and in such correct outline that in the distance the land had the appearance of patch work, like our grandmothers' bedquilts. If a cow or a mule was being pastured, a stake and a rope defined its sphere. Yet, with all the regularity, everything has a picturesque expression. The weather has been cool and delightful, with but little rain. I am told that grains and fruits of all kinds are abundant in France this year, which must be most grateful to this war-taxed people. One sees altogether too many soldiers here for a Republic. Among the taxed articles one finds letters. The postage on a single letter, so thin you can almost see through it, to any part of France, is five cents. On the same to America it is twenty-five cents. On the same from America here it is ten cents. Of all sorts of taxes, a postal tax is the most to be condemned. It should be a matter of humiliation to Americans that the English are ahead of them in having a penny post.

French Women.

I do not find the French women nearly so ugly as they have been represented. There are few fair-haired ones. In shape they are most attractive, straight, plump, finely developed and symmetrical. I have yet to see one untidy in person or poorly dressed. Black is the universal color worn in the street, while gray is occasionally seen. The peasant women wear black dresses, white aprons, and invariably a white cap, often much ornamented with embroidery, but always clean. The ambitious American girl with her expansive crinoline, her cotton lace, her dresses of red, of green or blue, her "Milton" jewelry, and her jute structures, has no synonym here. The material of the French woman's dress is always good. If she can afford to trim it appropriately she does it, if not she wears it untrimmed, save with a neat fold or two. She seems to know how to dress herself instinctively, and she makes up in grace and politeness what she may lack in beauty.

The Frenchmen

dress equally well, and whether peasant or tradesman, is always so very neat and clean. I cannot in any way harmonize the neatness of the people and the too frequent untidiness of their dwellings.

The Usual Age at which French Girls Marry

is sixteen. Ask them why they marry so young, they shrug their shoulders and proceed to explain that a French girl has no liberty until she is married, after which she can do anything she pleases. While a maiden she never can see a gentleman alone, go to church or appear anywhere in public, even for a walk in the street, without her mother or some suitable companion. Consequently our advent and tarry in this small town is a matter of constant and continuous surprise to the inhabitants. They hang out of the windows, stand in the open doors, gather in groups in the streets, and stare from every nook and corner whenever we appear in the streets. Sometimes we laugh and sometimes are vexed. Only yesterday I spent a couple of hours on the banks of the Seine making a sketch, and so horrified a gentleman who passed in my neighborhood that he caught his toes and nearly fell in the river.

"And you went *alone*?" exclaimed a French lady.

"Yes, all entirely, completely alone; I still live, I am an American. It is the land of liberty."

"Ah, it must be delightful to be an American," she sighed. "You do not have to marry then to be free, there."

MARY A. E. WAGER.

TOO LATE FOR EXPLANATION.

LORD MARK KERR, who distinguished himself at the battle of Fontenoy, was a good but eccentric officer, and a terrible duelist. His debut was remarkable. He was a kind of slight, effeminate appearance, apparently void of spirit. His father, the Marquis of Lothian, when he brought him to London to join his regiment—the Coldstream Guards—requested the Colonel, who was his particular friend, to watch over him, and see that he submitted to no improper liberties, and to instruct him in the way he should go, in case he had the misfortune to be insulted.

Those were the days of hard drinking, "prodigious swearing," and brutal manners. This pacific young scion of nobility soon became a butt at mess, a stop-peg to hang practical jokes on, until at last a captain of a year's standing threw a glass of wine in his face. He still said nothing, but wiped his face with his handkerchief, and took no further notice of the insult he had received.

The Colonel thought it was high time to interfere, and invited him to breakfast, *tete-a-tete*, on the following morning at 9 o'clock. Lord Mark arrived punctually, ate his breakfast with perfect composure, and spoke but little. At length the commanding officer broke ground.

"Lord Mark," said he, "I must speak to you on rather a delicate subject, but, as your father's friend, I am compelled to waive ceremony. Captain L.—, yesterday morning, publicly passed an affront on you, which both your honor and the credit of the regiment require you to notice."

"What do you think, sir, I ought to do?" inquired Lord Mark.

"Call on him for an explanation," rejoined the Colonel.

"It is, I fear, too late for that," replied the young ensign, "I shot him at eight this morning, and if you take the trouble to look out of the front window, you will see him on a shutter."

FOREVER.

BY L. BURDICK.

WHOEVER smites the wrong, the right upholding,
In spite of error's clamoring cries;
Whoe'er uproots the false, the truth unfolding
Along the paths where ignorance lies;
Whoe'er, opposing vice, is nobly giving
To virtue's cause his best endeavor;
However lowly life he lives, is living
A life to be forgotten never.

Whoever lifts his hand against oppression,
Where'or the blighting curse may fall;
Whoever makes his life a sweet expression
Of love of equal rights for all;
Whoe'er, the work of hand or brain bestowing,
Assists the tyrant's chains to sever;
Though humble deeds he does, some seed is sowing,
Whose fruit will gladden hearts forever.

Whoe'er, to an afflicted brother, needing,
Extends the hand of charity;
Whoe'er binds up a heart that's broken, bleeding,
With bonds of love and sympathy;
Whoe'er, by kindly word or act bestowing,
Binds human hearts more close together;
His deeds, through rolling years, in beauty growing,
Shall live in memory forever.

Whoe'er, from sin and shame and degradation,
Assists an erring one to rise;
Whoe'er with life itself upholds the nation,
When freedom needs the sacrifice;
Whoe'er lives not for selfish ends and glory,
The law of love forgetting never;
His name, though written not in song and story,
Will live in human hearts forever.

Our Story-Teller.

OUR ABORIGINES.

BY DORA WHEELOCK.

A RELATIVE of mine, a Wisconsin woman, was visiting in Ohio, at a friend's house, one afternoon, where she met a number of ladies. The conversation turned upon our Western country and Western people, and at length, in a pause in the conversation, one lady eagerly, and almost under her breath, asked:—"Did you ever see an Indian?"

"Yes," I replied.

"Did you?" chorused the others, breathlessly.

That was *too* funny. One might with almost as much propriety ask a Southern woman if she ever saw a Negro. Indians camp in our woods, frequent our towns, beg at our doors and along our country roads are always to be met, singly, in pairs, squads and droves—more respectable in numbers than reputation. Especially is our little village—and the lake region about—favored (?) with the presence of these noble "sons of the forest," and daughters as well, to say nothing of the swarms of red infantile humanity.

Our Indians are "wanderers upon the face of the earth." They camp now here, now there. First at Packwaukee, then at Montello; now at Kilbourn, and now at the Portage; in Winnebago, and down below Berlin, and, again, the shores of our own beautiful lake; Puckaway will be their resting place. Their wigwams dot its banks, and their canoes its bosom, and, even while here they cannot stay long in one place. Like many a family man I wot of, their mania for "pulling up stakes" comes upon them about once in "so often," and immediately they move. A little while they linger near the "old camping ground," then they are found on Big Island, and soon again on Squaw Island. And so they rove, Ishmaelites indeed, in whom there is much guile.

Taken as a class, they are a dirty, lazy, shiftless set of beings, much more inclined to beg than to work. But among them are many redeeming characteristics. With all their dirt and laziness, and disagreeableness generally, I have always had much charity for the Indian. I think there may be some excuse for their laziness when they can obtain so little for anything they may have to sell. For cranberries, huckleberries, game, furs and feathers, and the really handsome mats made of the rushes of our lake, dried and dyed, and woven together with cords of bark—the white people will give but half price, and that, perhaps, in poor pork and poorer molasses. I think there has been some improvement in this respect in the last few years, and there is still room. Those who have hired Indians in the harvest field have been well satisfied with their work. Oh! if some "one who loves his fellow men" would devote himself to the work of improving and uplifting this neglected part of God's creatures, what gratifying results might be his reward. Much might be hoped for, with a good prospect that hope would end in fruition.

In their tramps the women and ponies carry the burdens, and it is really pitiful to see them loaded down as they sometimes are. Colts a year old may be seen with a load, and perhaps a young Indian on the top of that. The babies are carried on the backs of the squaws, wrapped in the blanket. "Do their children ever cry?" I have been asked. An Indian and a squaw trudged along very unconcernedly one very hot day, while a wee baby in the blanket rolled its little uncovered head from side to side and cried at the top of its little voice, as the hot sun beat down upon it. Last winter a little pappoose became separated from the rest of the party. I assure you he cried quite as lustily as one of our own boys might if he had "lost himself."

There are many original characters among the Aborigines which we may style "ours"—those who stay most of the year upon our lake shore. And first let me tell you of HINOCKER and his squaw, MARY; for he is something of a chief among his people. In form and feature like any other Indian, he has yet much good humor beaming in his eyes, and is really fine-looking. His black hair is combed (?) straight back from his face, with two or three wee little braids at the crown, each tied with a bit of bright ribbon. He almost always carries a small round looking-glass, set in a frame studded with brass-headed nails, and held by a long handle. His wife is a good-looking squaw, quiet and pleasant. She never came begging to me but once, and then in company with old MOLLY—of whom more hereafter—who did all the talking. I visited HINOCKER and lady once in their own home. MARY and the pappooses were languidly reclining (on their stomachs) in the door of their wigwam, along with the dogs and other things. They were quite talkative and entertaining till HINOCKER was stricken with a sudden fit of work. With alacrity he brought out a draw shave, and running down to the bank of the lake, began to smooth a pole he was preparing for a wigwam. So we left him.

The Indians are great beggars. They go around to the back door and knock, or, if they find a window handy, peek in at that with their rough "Bazhoo" (How do?). Then it is, "give me piece bread," or pork or flour or salt; or, perhaps a dirty paper is extended in silence, whereon you read that the bearer is a good Indian, doesn't drink whisky nor steal, has a family of six children, or is sick himself, and imploring, as you are a Christian, to aid him. Signed, "A Friend," or with the name of some white man. When the paper is worn out, some one is requested to write it over. A rough joke was played on one of them by a young fellow who wrote a "paper" for him. The unsuspecting Indian presented it to several persons, who read:—"This is a great lazy coot of an Indian. If he comes begging, give him a kick, and tell him to *Puckaway*."

I think an exchange is sometimes made, or the paper given a friend, for I one day received a call from a boy about twelve years old, whose paper stated that he was "the grandmother of four children, depending on her for support. Anything you may have to give will be acceptable. GOD loveth a cheerful giver." I could have cheerfully given the young male grandmother a piece of my mind, but I didn't. I gave him a piece of bread, and told him to *puckaway*.

One day, as I was at work, the room seemed suddenly to grow dark, and a faint "oh, mumma!" from my three year old boy, caused me to look quickly around. Close up to the window stood a fat squaw and a boy, looking in very composedly. I confess that for an instant my heart stopped—I was so startled. GENIE, who was always afraid of Indians, ran into the bedroom. I went to the door, and found they had "pish" to sell; but, having no desire for the stiff, dry things, I did not buy. It is this silent stealing in that always so startles me, while I am not frightened. Another day, while sitting at work with my back to the door, I felt, suddenly, a presence, and with cheeks aflame and my heart in my throat, I turned quickly. There stood HINOCKER—painted, tall and, for the moment, terrible. But he laughed, and said he come in to warm a little; and I felt perfectly secure, though I could not still the beatings of my heart for some minutes.

Marquette, Wis.

LET ME TACKLE HIM.

IN a case in which Jeffrey and Cockburn, when barristers, were engaged, a question arose as to the sanity of one of the parties concerned.

"Is the defendant, in your opinion, perfectly sane?" said Jeffrey, interrogating one of the witnesses, a plain, stupid-looking countryman.

The witness gazed in bewilderment at the questioner, but gave no answer. Jeffrey repeated the inquiry, altering his words to "Do you think the defendant capable of managing his own affairs?"

Still in vain.

"I ask you," said Jeffrey, "do you consider the man perfectly rational?"

No answer yet.

"Let me tackle him," said Cockburn. Then, assuming his broadest Scotch tone, and turning to the obdurate witness, he began:

"Hae ye your mull wi' ye?"

"Ou, ay" said the awkward Cimon, stretching out his snuff-horn.

"Noo, hoo long hae ye kent John Sampson?" said Cockburn taking a pinch.

"Ever sen he was that high," was the ready reply, the witness indicating with his hand the alleged altitude.

"An' d'ye think noo, atween you an' me," said the barrister, in his most insinuating Scotch manner, "that there's onything intil the cratur?"

"I wudna lippen him wi' a bull calf," (I would not trust him with the guardianship of a bull calf,) was the instant and brilliant rejoinder.

The end was attained, amid the convulsions of the court.

Some editors take the aurora very bad. This is how it affected one in Illinois:—"Here we lean over the verge of the infinite, longing to grasp its mysteries, lost in the profundities of immensity."

Sabbath Reading.

GOD REIGNS.

BY EMMA BURT.

A CLOUD came rolling up my sky, to-day,
Trailing its robes of wrath. It heavy hung
With hidden bolts; yet muttered not a threat.
The air grew strangely dark; and all was mute.
"It comes! It comes!" I cried, then shrank to earth,
And shut my eyes, and held my coward breath.
Instead of flash, and crash, and shock, and death,
There came a voice so sweet—so wondrous sweet!—
I think it must forever echo, tossed
From point to point, adown the years.
Op'ning my wond'ring eyes—Behold a bird!
Poised on a laurel twig. All tremulous,
It swayed the bough with ecstasy of song.
The cloud was broken, and a shaft of light
Lay down across the Earth. A song of trust—
A molten pathway up from Earth to Heaven!

OTHER PEOPLE'S JUDGMENTS.

DR. DEEMS says:—There is nothing so good that it may not appear evil; to the evil, all, even best things, seem evil; you can always make your act good, but you cannot always make it "appear" good to another; the character of the act depends upon you, the "appearance" of the act on him. Was there ever a virtue that did not seem a vice to a man's enemy? Does not his liberality appear prodigality, his economy parsimony, his cheerfulness foolish levity, his high conscientiousness puritanism, his temperance asceticism, his courage foolhardiness, his devotion hypocrisy? How is it possible to avoid such judgments as these unless a man could have the whole world for his friends? Can the Heavenly Father demand more of you than that you really be true and faithful and pure? Must you also fritter your strength away in striving to make your good life seem good in the eyes of perverse men? No, my brother, there is no such foolish requisition in all GOD'S holy word. Your life must be essentially good.

THE TELESCOPIC FACULTIES.

MEN'S faculties are telescopic. Used in their lower state, they are, as it were, undrawn out. They are capable of being brought to a condition in which they will be a hundred times more than they are in their ordinary and spiritually undeveloped condition. It is the proper state of the Christian to rise higher than this common, ordinary, and, if you please so to call it, normal state of faculty. The consciousness of this transcends all other evidences of the divine life. While some men are perpetually seeking to measure themselves, to know whether they are in the faith, there are those all around about them who scarcely ever propose the question to themselves. For they are lifted up into that region of moral consciousness which abounds and superabounds with the evidence that they are the Lord's.

THOUGHTS FOR THINKERS.

Who are to be Pitied?

BEECHER says:—"There are persons who look upon all that are seeking a religious life as pitiable, because they do not have liberty; because they are tied up; because they cannot enjoy the world as worldlings do. But I affirm the contrary—that no man can or does enjoy so much of this world as that man who is aiming to prepare himself for the kingdom of GOD'S glory. The religion of JESUS CHRIST is not ascetic, nor sour, nor gloomy, nor circumscribing. It is full of sweetness in the present, and in promise; and the only suffering which it entails is such suffering as the liar experiences in learning to tell the truth."

The Universe our Study.

DANIEL WEBSTER once said:—"GOD seems to have proposed His material Universe as a standing, perpetual study to his intelligent creatures; where, ever learning, they can yet never learn all; and if that material universe shall last till man shall have discovered all that is unknown, but which by the progressive improvement of his faculties, he is capable of knowing, it will remain through a duration beyond human measurement and beyond human comprehension."

No Loss of Time in Prayer.

"'*A whet is no let*'—saith the proverb; mowers lose not any time which they spend in whetting or grinding their scythes. Our prayer to GOD in the morning before we enter on any business doth not hinder us in our day's work, but rather whets it, sharpens it, sets an edge on our dull souls, and make our minds to undertake our labors with the greater alacrity."

The Value of Recognition.

"HE who recognizes his king under the coarse garb of a peasant will receive him very differently from another, who, thinking he sees only a person of low degree, treats him accordingly. In the same way the soul which sees the will of GOD in the smallest things, and in things the most trying and overwhelming, receives them all with joy and reverence."

PRAYER is Israel's only weapon, a weapon inherited from its fathers, a weapon tried in a thousand battles.

Ladies' Port-Folio.

DEFAUT DE LA CUIRASSE!

AFTER BERANGER.

ONCE, at Autumn morning!
Who's purple were the skies,
And dun and yellow was the grass,
And gay the butterflies:

To mine arms, with dancing feet
There came a merry maid,
With blnest eyes and roseleaf mouth,
And this is what she said:

"Do you love me as you swear,
Do you love me true;
With a love to know no change—
As true as I love you?"

Swift at her words a shadow
Came over the bright sun:
Would I truly love her
When the day was done!

Would, in gloom and midnight,
'Midst Winter's blight and cold,
This love born in the Summer,
So full of heats—so bold:
Live and endure unchanging,
Grow stronger every day;
Or would it fade and perish,
Uncherished—pass away!

Within mine eyes she read the doubt
Whether I could be true,
To kisses born of Summer heats—
Warm kisses not a few;

And like a frightened, wounded dove,
She fled from out my sight,
Since when I vainly seek her
Who, lost, is my delight.

—For now I know too surely,
As draws the evening near,
She whom I loved in Summer
In Winter still is dear.

MARGARET FIELD.

EVERY-DAY LIFE.

BY LEAD PENCIL, ESQ.

The Episode of a Kiss.

A LADY sends LEAD PENCIL, Esq., the following extract from "A Tale of the Yo-Semite," with the remark that "it is worthy a place in your Every-Day Life—it reveals what is the every-day life of every true wife." Here it is:

A sudden light broke over his face, and following the direction of his eyes, I perceived the gliding figure which had power to call it forth.

"My PLACIDA," said Mr. NANSTON, in the most mellifluous tone of his voice, indicating his wife to me; "She has walked out to meet us."

When we approached, Mrs. NANSTON murmured something about having come to look for ZANITA. But her husband sprang from his horse and kissed her; and the sweet, up-turned face told me precisely, and without any circumlocution, what she had come for. She had come for that kiss; walked three miles to have it thus much sooner.

She must have longed for it and wanted it, from the pink glow of happiness which reddened her whole countenance. If ever I should be tempted to envy a woman anything, it would be such a meeting as this. If ever I coveted anything, it would be such a destiny as this. They had only been separated twelve hours, and yet the time had been all too long; and that she had hastened to shorten it was an evidence of that perfect union of soul which makes corporal absence so unendurable; that wonderful unity of two in one, called wedlock.

I thought that here was fully realized the beautiful German appellation of "*mine man*," that seems to complete the full measure of everything—not merely the endowing with worldly goods and body worship, which the marriage ceremony enjoins, but "*mine man*" comprehends all his soul, his manhood, his whole being is included in the possessive case.

How few marriages ever bring about this real possession. Of husbands more or less exacting, more or less indifferent, selfish, unfaithful, there is always an abundant harvest; but of "*mine mans*" how few! And as Mr. NANSTON placed his wife upon his vacated saddle and walked behind her, ZANITA scrimmaging about in abortive efforts to make the colt keep on the path, I fell into a revery on connubial bliss in general, and that kiss I had just seen exchanged in particular—upon all it means and contained for her, to any one whose soul is in condition to accept and realize so much felicity cemented with another soul twin-born. Under such auspices I am of opinion, with KEMBLE, that we can realize upon earth something of the delights of heaven, which preachers so kindly inform us is so far away as to be nearly out of reach.

I am sorry for any married man or woman who does not know all that such a kiss—a conjugal kiss—means, or ought to mean, and is, or ought to be. If there is any higher trust and faith than such a kiss symbolizes, or should symbolize, I do not know what it is; and, I confess, I have little desire to know.

A Country Phase of Life.

I have received, through the RURAL office, the following letter, which I give without comment:

LEAD PENCIL, ESQ:—*Sir*. Have you ever lived in the country, on a farm? If not, has the story of daily farm life ever been told you? If not will you allow me to give you one phase of it as I have had opportunity to see it this summer? I visited a well-to-do farmer's family. The farmer has means to live well. He was "well educated" and brought up in a refined, though old-fashioned way. His wife is a good soul, less cultivated, perhaps, but with excellent intentions. They have one son—twenty-one years of age, full-fledged with young manhood.

Now let me say that I am not country-born and bred, and yet I have no prejudices against country life *per se*. If I have any it is against the *mode* of life I have witnessed this summer. I wonder if what I have seen is exceptional? I hope so! If not—well! let me tell you. It seems to me to lack both system and decency! Is that a betrayal of prejudices? I trust not. It lacks system, especially in the house where I had opportunity for observation. With plenty of room in the house—large sitting room, parlor, &c.—the breakfast was served *in the kitchen*, in *July and August*!—in the midst of the steam and, shall I say, *stench* of boiling clothes, unwashed milk pans, burning kettles, scorched grease, and the smoke of frying pork, &c. No order was to be seen in the arrangement of the table. The family, guests, hired men (fresh from the barn-yard and in their shirt sleeves), sat at table. The men and women (except *one* guest) had all bathed in a common wash basin, tidied their respective heads of hair (so far as there had been any attempt at it) with the same comb and brush, and taken turns at the same small, cracked mirror.

At the table there was no system of serving. Each had to help himself or herself. Although there were silver forks in the house—plenty of them—two-tined, cast-iron forks only were used. Each person used his or her own knife and fork to carve the meat as it was passed around; each knife served each owner as a butter knife. No small plates were used to serve sauce or vegetables upon. All were literally "dumped" together upon each individual's plate with meat and other food. Knives instead of spoons were used for filling mouths with stewed tomatoes, apple sauce, or whatever else happened to be placed before them. If I asked the maid servant for a glass of water she rose with an air of "I am as good as you, any day," and served me with a pout and toss of her head. Hired men reached across my plate with their filthy shirt sleeves, wet with perspiration, after a piece of pork or a potatoe—never taking the trouble to ask to be served. Why, sir, I had rather have stood behind the chairs of these royal sons of toil and served them with all the skill and grace of which I may be mistress than to have undergone the suffering caused by such an outrage of all sense of propriety and decency endured at a single meal with these good-hearted folk.

Then the way the housework was done! There was no division of labor nor attempt at economy of time. For instance, the last thing done in the day was what should have been done first. The beds were allowed to remain from morning till evening just as they had been left by the sleepers; the chamber slops were allowed to remain and ferment and exhale all day in the rooms. When emptied, at last, no common slop pail was used for removing them, but each individual vessel was successively carried through the house and emptied. In the kitchen there was the same want of system. Mistress and maid ran between the table and sink with single dishes in their hands. No tray was used for gathering the dishes. Before half of them were washed some other work was begun, to be half completed, dropped and another duty attempted. It was a perpetual *melee* all day. The women were worried and 'tired to death" long before night came. And no wonder! It tired me to sit and watch them in such farcical attempts to "do up the work."

Now, no farmer's wife need tell me that this is the way women in the country MUST live. I *know* I can do all that those two women did in half the time, with half the weariness, and do it far better. It's a lack of system, Mr. PENCIL—lack of knowledge how to do work—lack of thought and knowledge of what a home should be that drives so many young men and women from country homes. Do I wonder they leave such a life? *Not at all*, if this is a sample of it! How any woman, with any sense of propriety, with any natural refinement, with any perception, or who follows her intuitions even, can perpetuate such a life is more than I, a woman, can conceive. Do I pity such women? Yes, and *no*! I should if it were necessary; I *do* because they seem to think it necessary. I *do not* because I knew it is unnecessary; and I determined to write you what I saw and what I thought of it; you can print it or not, as you choose. Allow me to say, however, that the picture, however unskillfully drawn, is not *over*-drawn. It is true.

Shall I give you other phases of country life as I saw it.

SALLY TEAZLE.

WOMAN PERSONALS.

AT the dedication of Buchtel College, at Anderson's Landing, on the banks of the Ohio, Mrs. C. A. SOYLE of New York City, in an address, said:—"And I know that J. R. BUCHTEL is called, here and everywhere, the founder of this College. But I say to you that if J. R. BUCHTEL had not been blessed with a wife who was a representative woman, this magnificent edifice would never have been erected. There was a woman's hand, a woman's head, a woman's heart in the enterprise. I care not how much money a man may make, if he have not the right kind of wife to help in the spending, the world is rarely better off for all his gains.

THE new wife of PERE HYACINTHE, the widow MERRIMAN, is something of an artist as well as a linguist and writer for the press. A year or two ago she executed a medallion portrait of her new husband, which was very good. She is said to be fond of a sensation. When she was baptized into the Catholic Church at the Convent of the Assumption in Paris, PERE HYACINTHE indulged in a discourse, a distinction only accorded to princes of the blood. The French Sisters thought this a great scandal.

MISS CLARA LOUISE KELLOGG, the American *prima donna*, is the pet of New York *litterateurs* and artists. On her recent return from England, where she won fresh laurels for her artistic crown, the Arcadian Club of New York complimented her with a large reception and serenade, at which were gathered some of the best literary and artistic talent in the city to do her honor and give her welcome.

MISS KATE STANTON has been making a study of "The Lives of Great Men"—the title of her new lecture—and she places JOSEPHINE at the head of the list, *par excellence*. Discussing the love life of JOSEPHINE and NAPOLEON, she takes issue with other biographers, defending the divorce with great ability.

MISS RYE, an English philanthropist, has just left Liverpool with fifty children whom she is striving to save from a life of crime by providing them homes in Canada. This is a good work, and it is hoped this ounce of prevention of crime will be found to save a great many pounds of cure.

Reading for the Young.

MRS. ALDEN'S SURPRISE PARTY.

BY AUNT PHEBE.

THERE never was a happier class in any school than the B class in the Bluffton Grammar School. And never was a teacher better loved by her pupils than was Mrs. Dr. ALDEN. She made study and lessons a delight, and the most delightful of all studies was History. There were fifteen boys and girls in the History class, and the recitations were more like pleasant chats, in which a great deal of knowledge was gained, than the dry rehearsals of facts and dates, so often heard in schools.

One day a bright idea occurred to SUE DARLING. She was the merriest and gayest of the class. Her bright ideas generally originated in her active brain. The class had long been designing to make Mrs. ALDEN a present on her birth-day, and SUE'S idea was to give her a Surprise Party—not of the kind then so fashionable, but something entirely new and novel. In fact, they were to go *en costume*, representing the heroes and heroines of old New England days.

Once decided upon, the parts were soon assigned, and daily discussions took place beneath the Charter Oak, a huge tree which gave abundant shade for the fifteen members of Class B. This class was very exclusive. Fifteen was their magical number. No confidants were made outside the select circle. Exceedingly dignified was Class B, and although Class A did not condescend to notice it, Class B, in its turn, looked down upon C. Thus the all-absorbing plans were kept a profound secret.

About six o'clock on the evening of Mrs. ALDEN'S birth-day, and of the Surprise, Class B met at SUE DARLING'S; and such laughing as was heard from the grown folks of the family, at the grotesque appearance of the masqueraders. HESTER and ALICE, SUE'S sisters, assisted them in perfecting their toilets, and at seven o'clock they started, each with a dish of some old-fashioned New England food for Dr. ALDEN'S house.

There was Elder BREWSTER—that was FRED RAINE with his Kossuth hat, great walking-stick, and a large gray overcoat of mammoth proportions, belonging to Mr. WILLIS, our school superintendent. There was CHARLEY PAINE as ROGER WILLIAMS, with his uncle's cavalry hat and ALICE DARLING'S water-proof cloak. JOHN SMITH and King PHILIP were represented by DAVIE TELLING and PHILIP ARMSTRONG—the former in the garb of a backwoods hunter, and the latter in full Indian dress; that is, he was well painted and had borrowed his sister's red shawl for a blanket, while the turkey's feathers in his hair showed that he had been to somebody's poultry yard borrowing. *Pere* MARQUETTE was there, dressed in a very long water-proof cloak, the hood drawn over his head for a cowl. GEORGE BENSON was dressed as BENEDICT ARNOLD, in the uniform of a second lieutenant; but his jingling sword made up for small defects. JOHN PAUL JONES in naval costume, and GEORGE WASHINGTON in exceedingly gay epaulets and an exceedingly rough-looking cocked hat. His wife, MARTHA WASHINGTON (LULA WADE), looked a great deal more stylish in a brocade silk of her mother's, powdered hair and high-heeled shoes. Indeed, she was a fashionably attired young lady of 1872, and MARTHA WASHINGTON too. SUE DARLING represented POCAHONTAS; gay little EMMA CHESTER was dressed as Major MOLLY; while gentle MARY TILLINGHAST was MARY CHILTON, the "Young Maiden of the Band," who was the first to step on the Forefather's Rock. NETTIE BLISS represented faithful LYDIA DARRACH, and she looked laughable enough, in her plain gray dress, with a shaker covered with gray cloth. Mrs. ANN HUTCHINSON was present in the person of JESSIE MILLARD, while DORA PHELPS brought up the rear as Mrs. WHITE, the first wife and mother of the English Colonies; a large rag doll, a relic of her own babyhood, was supposed to personate young PEREGRINE WHITE.

"I wish the Doctor might be away," whispered SUE, as they reached Mrs. ALDEN'S gate. "I can't half enjoy myself if he sits looking at us so stern and awful."

Dr. ALDEN was principal, and taught in the Big Room, as they called it. But all the pupils in the house, knowing his strict, stern ways, stood a good deal in fear of him.

"Who shall go first?" asked timid MARY.

"ELDER BREWSTER," whispered SUE.

So FRED, who was naturally a very solemn-faced lad, marched boldly to the door, and as it was opened, they caught a glimpse of dear Mrs. ALDEN sewing by the table. Then in walked FRED, saying: "ELDER BREWSTER, at your service, sir"—taking off his hat and making a low bow to the Doctor—"and Madam," with a bow to Mrs. ALDEN. "My friend, Gen. WASHINGTON, sir, and Madam, his wife, Mrs. WASHINGTON; ROGER WILLIAMS and Mrs. WHITE; also the youthful PEREGRINE, Mrs. HITCHINSON, Capt. JOHN SMITH and POCAHONTAS, King PHILIP, *Pere* MARQUETTE, LYDIA DARRACH and MARY CHILTON, JOHN PAUL JONES, BENEDICT ARNOLD, and Major MOLLY."

As FRED gave these introductions, Dr. ALDEN recognized each with a very grave bow. When all had entered, and the door was closed, he sat down in his great arm-chair, and leaning back, laughed—actually laughed so long and hearty that his handkerchief was brought from his pocket to wipe the tears from his eyes. And this being well-nigh accomplished, he was seized with another fit of laughter that rendered a repetition of the wiping operation necessary.

The ice was broken! and during the whole evening the stern and grave Dr. ALDEN was the life of the company and the gayest of the gay. I wish I could tell you of all the pleasure and enjoyment of that evening. Mrs. ALDEN soon carried off MARY CHILTON to assist her in getting ready the supper, while Dr. ALDEN entertained his guests in the parlor. Approaching King PHILIP, he held out his hand, saying:—"You are friendly, I suppose?"

PHILIP took his hand, and, squeezing it as hard as he could, grunted "Ugh! Ugh! Me good Injun; me like white man," and filling a clay pipe with tobacco (dried catnip leaves) and lighting it, took a few whiffs and handed it to Dr. ALDEN. The Doctor refused, but King PHILIP, emboldened by the Doctor's gay and boyish manner, flourished his hatchet, then grasping Dr. ALDEN by the shoulder, compelled him to take a whiff or two amid the shouts of the class—all of which was taken in good part by the Doctor.

He then approached Major MOLLY, and inquired, "And who, pray, are you?"

"INSULT WEBSTER," she replied, with an innocent air worthy of Mrs. PARTINGTON. Again the laugh was raised at the Doctor's expense, for his favorite reply to numerous questions of his pupils was "Consult WEBSTER," WEBSTER being an unerring guide in all matters of spelling and defining.

Finding himself worsted at every point, he concluded to take a seat in the corner, by the side of Mrs. WHITE.

"How is little PEREGRINE this evening?" he asked.

But, before Mrs. WHITE could reply, Major MOLLY dashed up, and, grasping the baby, said, "Do let me take the baby."

But Mrs. WHITE would not let it go, and Major MOLLIE would not let it go, and between them poor PEREGRINE suffered a severe wound in his neck from which the sawdust poured in a manner dreadful to behold.

"Let me attend to this hurt," said the Doctor, taking the baby tenderly in his hands; then, with a sudden toss, poor PEREGRINE was landed on the top of the bookcase, and there he calmly reposed the remainder of the evening.

The supper consisted of pork and beans, nut-cakes, pumpkin pie, cheese, cranberry tarts, cider apple sauce and baked whortleberry pudding. Roast beef was substituted for venison, and all were satisfied that the supper was sufficiently "Puritanical."

Photograph albums were then very fashionable gifts, and after supper, LYDIA DARRACH, in a neat little Quaker speech, presented to Mrs. ALDEN an album containing all the portraits of the B class.

At ten o'clock all went home, delighted with the "Surprise;" but *they* were quite surprised next morning, at school, to find Dr. ALDEN the same grave, stern man they had always thought him. But they loved him more for the glimpse he had given them of his good-natured self.

RIDDLE.—No. 4.

THERE was a man of Adam's race
Who had a transient dwelling place;
A house complete, well covered o'er,
Where no man dwelt since or before.
It was not built by human art,
Of brick, wood or stone in any part,
Nor rock, nor cave, nor any den,
But curiously was wrought within.
'Twas not in heaven, we know full well,
Nor on earth's face where mortals dwell.
Now, if you know this man of fame,
Tell where he lived, and what's his name.

CURRENT TOPICS.

The New York Liberal Club Dinner.

This Club was organized three years ago on the Centennial Anniversary of the birth of Humboldt, its sole object being the free discussion of social and scientific topics. Seven gentlemen were included in its organization. It now numbers 200 members. Horace Greeley is its President and presided at its third anniversary dinner at Delmonico's, Oct. 5, at which near 200 members and guests were present. Among the guests were Dr. Ludwig Buchner, the eminent German Philosopher; Edmund Yates, the English novelist, now on a lecture tour in this country; Miss Susanna Evans, well-known as a lecturer; Prof. Henry Draper of the New York University Medical School; Dr. Minnie Putnam of the N. Y. Woman's Medical College; Whitelaw Reid, managing editor of the N. Y. Tribune; Dr. J. V. C. Smith, ex-Mayor of Boston; Mrs. Elizabeth Dudly, a rising story-writer; Miss Kate Hillard, poetess, and others. Among the prominent members present were noticeable, after looking at the serene face of the venerable President of the Club, the 1st Vice-President, W. L. Ormsby, Jr., whose hobby is enlightened self-interest, and who made the wittiest speech of the evening in response to a toast on Altruism; D. T. Gardener, the industrious and eloquent Secretary who bears the burdens and to whom is conceded the honor of the Club's great prosperity and efficiency, and who bears both the honors and burdens modestly; Dr. P. H. Vander Weyde, an eminent scientist and the editor of the Manufacturer & Builder of this city; David C. Croly, the industrious and efficient managing editor of the N. Y. World; Mrs. Jennie June Croly, the well-known fashion writer and editress of Madame Demorest's Fashion Magazine; Dr. Louis Elsberg, Professor in the N. Y. University Medical School; Prof. C. A. Seeley, the well-known chemist; J. Wilson McDonald, the sculptor; Thaddeus B. Wakeman, the high priest of Positivists in this country; John Elderkin a well-known *litterateur*; Stephen Pearl Andrews, the discoverer of the new science of Universology and the author of the new language known as Alwato; George P. Rowell, the great advertising agent; Prof. J. K. H. Wilcox, the eminent peace advocate; Dr. R. T. Hallock, the earnest defender of Spiritualism; Charles Moran, a zealous political economist of the Free-trade school; Nicholas Muller, the German poet; Dr. T. S. Lambert, the well-known lecturer upon the Laws of Longevity; J. K. Ingalls, the earnest advocate of Land Reform, and others scarcely less prominent. Among the notable thinkers of the old world who have accepted honorary memberships in this Club, we may name John Stuart Mill, Emile Littre, Ernst Haeckel, Thomas H. Huxley, John Tyndall, Charles Darwin, Brasseur de Bourbourg, Victor Hugo, Herbert Spencer and Hermann Helmholtz. From several of these gentlemen last named, the Club has received communications of public and scientific interest which have been read, discussed and deposited in its archives.

A Diamond Sensation.

The World gives us the latest diamond sensation in the shape of a story signed by James H. Martin, purporting to tell how a friend discovered how to manufacture diamonds by the hundreds, and how he has done it in detail and has made millions of dollars worth thereof which have (a large portion of them) been put upon the markets of the world. The discovery, it is claimed, consists in suddenly chilling and thus crystallizing carbonic acid gas—by eliminating from it the oxygen by absorbing it with neutrals. This is the brief of a two-column statement of the process and the material used. Mr. Martin asserts that on Wednesday, Sept. 25, he saw his friend make 600 diamonds, weighing, in the aggregate, eleven pounds and four ounces; and Tuesday night, Oct. 1, he saw him produce 821 more weighing ten pounds eleven ounces. Mr. Martin asserts that the inventor of this process has manufactured by it about 1,500 pounds of diamonds and has disposed of about 800 pounds, having still unsold about 700 pounds. Those disposed of have brought him an average of about $30,000 per pound or $24,000,000 of dollars. He has now about 700 pounds in the hands of agents from whom he is receiving advices daily. The inventor gave Mr. Martin the secret because he did not care to keep it longer; he is rich enough, and the care of his great wealth he finds to be greater than the cares of poverty. He paid Mr. Martin $800,000 for the two batches of diamonds made at the dates above named when revealing to him his secret. This story is a strange one and few will believe it.

Pauline Lucca and the Indians.

Pauline Lucca, the new and charming *prima donna*, called upon the Indian chiefs at their hotel in this city the other day and gained their consent to return her call, which they did the 5th inst. After the greetings were over and the Los had quenched their throats with champagne, they were induced to sing an Indian chorus; of course Lucca was delighted. They then insisted, through their interpretor, that the petite Pauline should sing for them, which she did and at which they grunted great satisfaction. The eminent chiefs who thus honored Lucca are named, in the daily papers, Messrs. Flying Antelope, Thunder Hawk, Afraid Of, Mad, Two Bears, etc. We do not vouch for the correctness of this nomenclature.

Charles Sumner's Health.

A London correspondent of the New York *Tribune* appeals to Mr. Sumner's friends on this side of the water to let him alone for the next three months, stating that the spinal affection resulting from the blows of Preston Brooks many years ago has resulted finally in an affection of the heart, causing, in the language of his physician, such suffering, that he could compare it to nothing but pain endured under the knife of a surgeon in operations of the gravest character. He was forced by his physicians and friends to leave America, much against his will and wishes, and secure the most complete rest, all mental work being interdicted.

The New York Mayorship.

The most agitating political topic in this city is, "Who shall be Mayor?" Fifteen or twenty candidates are named, if not actually in the field, for nomination, of their own free will and desire. There is a strong "reform" feeling among the citizens, who know and feel its necessity, both for the good name and financial status of the city; but politicians are active in their efforts to be considered "reformers" capable of carrying out the wishes of the people. The result, looking over the field impartially, does not seem to promise union, irrespective of party, *pro bono publico*. We wish it did.

Making German Citizens.

Alsace and Lorraine were, by the fortunes of war, annexed to the German Empire. Its citizens had the privilege deciding whether they would remain in their old homes as German citizens and forswear their allegiance to the Government of France, or leave their homes and adhere to France. It is estimated that 88,000 Alsatians will take up their residence in Nancy alone, while multitudes settle in other parts of France, thus refusing the benign government of the Germans. War has not developed love towards their conquerors in the hearts of the French.

The Escurial of Spain.

The Escurial, the famous monastery of New Castile, thirty miles northwest from Madrid, a solid pile of granite which has been called the eighth wonder of the world, commenced in 1563 and finished in 1584, designed to serve as a palace, mausoleum and monastery, the receptacle of books and the works of art, and the pride and boast of Spain, has been burning since our last issue. Few of the valuable objects which it contained are destroyed, but the amount of damage sustained by the building is estimated at $375,000. Two of the towers and a part of the roof have been destroyed.

A Chicago Jubilee

is proposed in October, 1873—a festival week celebrating the rebuilding of that city, and including a series of entertainments, in which all nations that contributed to the Chicago relief fund are to be invited to participate—*a la* Boston, except on a bigger scale. The project includes making arrangements with railways, steamships, hotels, and private citizens, whereby all the world having a ticket can come and go and partake of the entertainment without trouble, and at a uniform price.

Death of Dr. Francis Lieber.

Francis Lieber, L.L. D., Professor of Constitutional History and Political Science, in Columbia College, and an eminent writer on Government and civil law, died of heart-disease in this city, Oct. 2, aged seventy-three years. Dr. Lieber has been a voluminous worker, held high position in educational institutions, been regarded the peer of the best minds in this country as a thinker, and has exerted a wide influence upon the analysis and interpretation of civil law in this country.

The Oil Strike.

The price of oil has not been compensating. The result has been that there has been a grand combined movement in the oil regions of Pennsylvania to stop production until the price appreciates to paying figures. This "strike" is of great magnitude, embracing a whole community of producers. The cessation of labor throughout the oil region is general, and oil is to be forced up in price while it remains quiet in its subterranean reservoirs.

Two Hundred and Fifty Pages.

Sir Alexander Cockburn has, it is telegraphed, written and published a pamphlet of 250 pages, explaining his disagreement with his colleagues, the Geneva Arbitrators. It will, probably, be interesting reading for his colleagues and students of international law and the Washington Treaty; but what do the people care about them since there is no appeal from the decision of the majority?

The Crops of Europe and America.

A writer in the *Independance Belge*, at Paris, classifies this year's harvest as follows:—England, below the average; Germany, tolerable; Austria, Russia, Scotland, and the Danubian Principalities, middling; Belgium and Turkey, average; Spain, very good; United States, somewhat above the average; France, exceedingly good; Ireland, middling good; Italy, above average; Switzerland, good.

Eleven persons were killed and many injured... .During the past three months 54,000 emigrants left Liverpool for America....The overland telegraph line in Australia has been completed.. .The Escurial, 30 miles from Madrid, was struck by lightning on the 2d, and nearly destroyed....Eighteen thousand persons left Metz in two weeks—only 10,000 remain. Some 88,000 Alsatians will go to Nancy alone ...The insurgents in Mexico have assaulted Mazatlan and dispersed the garrison....By the burning of the America in Yokohoma 62 people were lost. She is supposed to have been set on fire... The potato crop has failed in Ireland and many parts of England....The library of the Escurial was saved in a damaged condition....It is proposed in England to make those who fitted out the Confederate privateers pay the damages....Spain will send 14,000 more men to Cuba. ..Agrarian outrages are reported from Ireland.

SEMI-BUSINESS PARAGRAPHS.

The History of a Great Enterprise.—In eighteen hundred and fifty-four, the original incorporators of the Wilson Sewing Machine Company embarked in the manufacture of Sewing Machines, and from that time to the present, their time, talent, energy and capital have been employed in making *First-Class Sewing Machines*, with varied success attending their efforts. It being their constant aim to produce a Shuttle or Lock-Stitch Machine that should be simple to handle, durable as steel and iron could make it, with unlimited capacity, unexcelled by any other machine, regardless of name or price, and withal to confine the price within the reach of all classes of people: and success has crowned their efforts in the production of the celebrated Wilson Under-Feed Shuttle Sewing Machines, which combine all the *Elegance, Simplicity, Durability* and *Strength* possible for any sewing machine to attain, and they are the *First* and *Only First-Class* moderate-price machines put in the market. Salesroom at 707 Broadway, New York, and in all other cities in the United States. The Company want agents in country towns.

Watch No. 24051, Stem Winder—bearing Trade Mark "United States Watch Co., Marion, N. J."—manufactured by the United States Watch Co. (Giles, Wales & Co.), has been carried by me three months; its total variation from mean time being one second.—Noah D. Payne. Publisher Providence (R. I.) Herald.

Facts for the Ladies.—Mrs. O. Pierce, Boston, Mass., has used her Wheeler & Wilson Lock-Stitch Machine since 1859, without repairs, earning from $12 to $15 a week, making men's clothing. See the new Improvements and Woods' Lock-Stitch Ripper.

Advice.—Send for free Price List. Jones Scale Works, Binghamton, N. Y.

THE SEASON, CROPS, PRICES, ETC.

Westport, Conn., Sept. 28.—The weather for the past month has been very favorable for the growing crops, such as corn, buckwheat, turnips, pasture, etc. We have had no frost yet of any account. Melons have been plenty and cheap. Corn is a fair crop; not all cut yet; buckwheat damaged—not much sowed; onions about all pulled—about two-thirds of a crop; potatoes not a large crop, and most of them run small size; they are rotting some in the ground and after they are dug; turnips are looking well, and bid fair for a good crop; cabbages are badly eaten by the cabbage worm, which spoils the looks of them even if they head. Sowed corn has done well, but the weather is bad to cure it. The apple crop is very large, and hundreds of bushels have rotted under the trees. The prospect for fruit to keep through the Winter is what I call slim, considering the quantity that grew. I do not believe there will be an average crop put up for winter; the trouble is, the weather has been wet and warm and the fruit is ripe on the tree, therefore it will not keep after it is gathered. Two years ago they ripened up the same way; there was a very large crop, but in the Spring they were worth $2 a bushel. Peaches were a fair crop. Grapes little more than half a crop.—A. S. N.

Oregon, Mo., Sept. 25.—Quite cool; had frost on the morning of Sept. 19; not much damage done; corn about all past danger; it is one of the best crops we have had for some years; most farmers are done with Fall seeding; the acreage of Winter wheat sown is small. The most of the fruit is cared for. Peaches were a little in excess of the demand, and many went to waste, at 25c. a bushel. Fall apples are worth 40@50c. per bushel, with but few in market; pears are very scarce, $2 per bushel; wild grapes and plums are very plenty and very cheap. Grape growers are having a busy time caring for the abundant crop of grapes, which are selling at 2@6c. per lb. Wheat (Winter), $1.75; oats, 15@18c.; barley, 25@35c.; rye, 20@30c.; corn, 18@20c. Plenty of Texas cattle coming to feed in this county during the Winter. Stock hogs, $3@3.50 per cwt. Money tolerably close at 15@20 percentum.—J. W. M.

Hamilton, Ill., Sept 23.—Extremely dry just now; crops good; corn extremely good; fruits of all kinds very abundant.—G. W. P.

THE RURAL'S FALL CAMPAIGN!

ANOTHER TRIAL TRIP!

A SPLENDID PREMIUM!

NEW QUARTER—NEXT YEAR.

THE RURAL NEW-YORKER is offered for the ensuing Three Months, from October to January, On Trial, for ONLY FIFTY CENTS; and for Fifteen Months—say from Oct. 1, 1872, to Jan. 1, 1874—for $3. This is giving Thirteen Numbers for Fifty Cents, and Sixty-Five Numbers for $3. To every person sending $3 for fifteen months, as above, or $5 for ten Trial Subscribers (from Oct. to Jan.) we will send as a Premium, postage paid, the Splendid Steel Engraving entitled

BIRTH-DAY MORNING,

OR THE GARDENER'S PRESENT.

Size 24x30—retail price $5. This beautiful engraving is illustrated (on a small scale) and described on page 193. Every non-subscriber to Moore's Rural should note this announcement—and every subscriber can secure the picture by either obtaining ten Trial Subscribers, at 50 cents each, or subscribing for 15 months, (and selling or giving away the paper for the next three months, or until his present subscription expires.)

THIS RARE OFFER

Is worthy the attention and effort of every reader. The engraving is first class in every respect, and, if sold, would be worth at least $5 per copy; but copies are not for sale, and, as we own the plate, this beautiful and artistic Picture *can only be obtained by subscribing*, or procuring subscribers, as above stated.

THE MARKETS.

PRODUCE AND PROVISIONS.

New York, Monday, Oct. 7, 1872.

Receipts.—The receipts of the principal kinds of produce since our last are as follows:

Corn, bush	1,592,000	Meal, bbls	4,350
Oats, "	301,240	Flour, "	65,620
Wheat, "	921,500	Eggs, "	7,695
Rye, "	300	Cotton, bales	15,780
Barley, "	69,000	Hops, "	124
Malt, "	20,500	Wool "	75
Seed, "	1,140	Butter, pkgs	18,200
Beans, "	2,858	Cheese "	30,740
Meal, bags	400	Lard, "	2,200
Peanuts "	625	Dried fruits, pkgs	2,258
Pork, bbls	1,512	Cut Meats "	921

Beeswax.—There is a light sale at 31@31½c. for Western and, 35@36c. for Southern.

Broom Corn.—The demand is unimportant, with prices unchanged. We quote at 3@5c. for red, ⅝@6c. for green, 7@8c. for hurl.

Beans and Peas.—New beans are more plenty and prices are lower. The inquiry is small, principally from the jobbing trade.

We quote Mediums, prime $2.50@2.60 per bushel; good do., $2.30@2.40; fair do., $2.00@2.25; prime marrowfats, $2.65@2.70; good do., $2.40@2.50; common and fair do., $2@2.25. Green peas at 97½c.@$1 in bulk in bond; $1.80@1.90 for green.

Butter.—Receipts of butter for month of Sept. 65,200 pk'gs, or 4,175 do. less than for Sept. last year. There is nothing new to remark in the butter trade. Fine and good table qualities absorb the demand, and as the proportion of these grades is small, compared with the receipt and what should be expected at this season, the market is very firm, especially for selections of half tubs. A few lots of well-kept Western are bringing full prices. We think there is rather a larger accumulation of low or dragging grades than there was at this time last fall.

Orange Co. pails, fine, 33@35c.; Penn. and N. J. pails, good to fine, 25@33c.; common, 15@18c.; selections, half tubs, 31@32c.; half tubs in lots, 27@30c.; good to prime firkins, 26@28c.; do. Welsh, Fall, 27@28c.; Welsh tubs, fair, 20@23c.; other grades of State, 18@22c.; Western Reserve, choice, 21@22c.; Western fair to good, 15@15c.; common, 10@11c.; grease butter, 7½@8½c.; Pa. and N. J. pails, medium to fine, 27½@30c.; poor, 15@18c. State dairies, 26@28c.

Cheese.—Receipts for Sept., 143,200 boxes—90,750 less than for Sept., 1871. The home trade have been buying freely, but exporters have been buying sparingly, owing to the high rates of ocean room. The cable quotes a firm market on the other side. Prices have been advanced a fraction.

We quote State factory, choice, 11@11½c.; good to prime, 13½@13½c.; half, 12½@13½c., State dairy, 12½@13c. for good to prime, 11½@12c. for fair lots; Ohio factory, 12½@13½c. for good to prime; English dairy, prime, 13½@14c.; fair do., 11½@13c.

Cotton.—Prices have advanced. Exporters are in want of stock, and there is a fair spinning demand.

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	15¾	16	16¼	16¼
Good Ordinary	18¼	18¼	18¾	18¾
Low Middling	18¾	19	19¼	19¾
Middling	19¼	19¾	19¾	19¾
Good Middling	20¾	20¾	20¾	20¾

For forward delivery the market is steady. Latest sales on the basis of low middling are at 18¾c. Oct.; 18¾c. for Nov.; 18¾c. for Dec.; 19¼c. for Jan.; 19¾c. for Feb.

Dried Fruits.—For apples the best grades only have a sale at the moment. There being no export demand, buyers generally obtain concessions, as there is a considerable amount of stock on sale. Peeled peaches are in speculative demand, the best grades only have a sale, and prime North Carolina have been sold at 22c. Unpeeled peaches are firmly held with but few lots of new in first hands. Blackberries are dull and in the buyer's favor. Raspberries are wanted. Cherries are in light supply and firm.

Southern apples, 8½@9c.; do. sliced, 8@9c. Peeled peaches at 14@17c. for Ga., 14@16c. for Va., and 17@22c. for North Carolina. Unpeeled peaches at 5c. for quarters, and 6@6½c. for halves. Cherries, 24½c. Plums, 14@12c. Blackberries, 10c. Plums, 14@15c.

Eggs.—Receipts for Sept., 25,700 bbls., 3,200 more than for Sept., 1871. Increasing arrivals have weakened the market. Trade wants also have been less urgent. Buyers refuse to take other than small lots. We quote Western at 23c.; Jersey at 21@30c; State and Pennsylvania at 30c. A few limed are in market selling at 25@25c. for State.

Flour.—The market for State and Western is very dull, and prices have declined about 15c. per bbl. The offerings are fair, and exporters are purchasing only small lots with a marked decrease in the home trade.

Superfine State	$6 00	@	6 45
Common extra do	7 00	@	7 20

Good to choice do	9 80	@	12 00
Rye, common to fine	4 35	@	5 35
Corn meal, Western	3 10	@	3 75

Fresh Fruits.—Peaches are no longer subject to useful quotation. Apples are slowly showing a steadier demand but prices are not rapidly improving. Most of the common stock is out of the way, and it is to be hoped that no more will be sent. This will be a poor season throughout for inferior apples. A few use-house Bartlett pears are all that remain of that variety: the best selling at $2. There is a better show of Virgalieus than for several past seasons. Other fancy pears, including Duchess, Seckel, Louise Bonne de Jersey, bring $13@16 as best quotations. Grapes have continued in heavy supply, but the quality favors the buyer and prices are rather steadier. Damsons and frost gages embrace most of the plums. Cranberries are offering liberally. The supply of chestnuts and hickory nuts will be lumenso this year, and the opening prices must be regarded as only temporary. Quite a number of apples—3,000 bbls. per week—are shipping abroad. We quote apples, choice, $2.12@2.30 per bbl.; good, including Western, $1.75@2; fair, $1@1.25. Pears.—Duchess, $3@13 per bbl.; Seckel, $8@11; Louise, $6@16; Sheldon, $8@12; common, including Vicars, $2.25@4. Plums.—Damsons, $7@9 per bbl; frost gages, $3@10; common, $1@6c. Grapes.—Prime Concord, 6@8c. per lb.; Delaware, 9@10c.; Iona, 11@12c.; Isabella, 6@7c.; Catawba, 9@10c.; poor, 3@5c. Cranberries, bbls., $9@10; crates, $1.25@3 for poor to prime. A few quinces are in market, but buyers for preserving are hardly ready for them yet.

Grain.—Wheat is lower, with a light sale to shippers, on account of the scarcity of freight room. We quote No. 2 Spring, afloat, $1.47@1.57; No. 1 do. $1.58@1.63; Winter red Western $1.50@1.80 for new; amber Western $1.70@1.73; white do. $1.70@1.95. Rye is quiet at 81½c. for Western. Barley quiet at $1.05 for Milwaukee, and $1.18 for Canada West. Corn is lower, but closed active and firm at 63¾@63½c. for steamer lots of Western mixed, 64¼ for sailing do. Oats are firm at 39@40c. for black Western, 42@44c. for new mixed do., 45@48c. for new white do.

Hay and Straw—Are selling slowly with a fair amount of stock on sale. We quote new shipping hay at $1@1 05; retail do., $1.35@1.40; salt, do., 55@80c. clover, 75@80c.; Straw at $1@1.15 for long rye, 75@85c. for short rye; 70@75c. for oat.

Hops.—The market is firmer, as receipts are small, with brewers buying more freely. It is the impression that present prices are likely to be sustained, at least until foreign come in sufficient quantities to go into competition. Growers are holding off, and some refuse to accept even 25c, preferring to wait until the market assumes a more definite shape. We quote New York, growth 1872, at 25@30c.; Eastern do., 25@30c.; Western do., 25@30c.; Yearlings '71 nominal; Olds '70 nominal; Old Olds, '68-69 10@15c.; Bavarians, 35@40c.; English, 25@30c.

Poultry and Game.—The Jewish holidays infuse considerable life in the live poultry market, and stock is well cleaned up at full quotations. A few lots of dressed are offering, quoted at 16@19c. for Western chickens 18@21c. for State fowls and chickens. Turkeys, 18@23c.

We quote live:—Turkeys, Jersey, per lb., 13@21c.; do., Western, 16@20c. Ducks, Jersey, per pair, $1@1.50; do., Western, 75@87c. Geese, Jersey, young, per pair, $2.50@3; do., Western, $2@2.50. Spring chickens, Western, per lb., 17@18c.; do., Jersey, 19@20c. Fowls, Jersey, 18@20c.; do., Western, 16@17c.; roosters, 10@11c. The advance of Fall gives a larger variety. The stock now includes partridges, per pair, $1@1.50; grouse, do., 75c.; woodcock, do., $1; pigeons, flight, picked, per doz., $1.25@1.50; do., feathered, do., $1@1.25. Hares, per pair, 50@75c. A few wild ducks are in market, but not quotable.

Provisions.—There is every indication that pork will be locked up this season. The stock at the West and here is under centered control, and the large contracts for future bacon stimulate holders in demanding very firm prices. Large parcels have again gone from yards. Cash round lots of mess quoted $11.50@11.62, and jobbing lots $11.55; for next month $11.10 was paid at the close, with a fair speculative business. Prime mess is firm at $13.70; extra prime, $11.50; old mess sold at $13.70. Beef is unchanged; the trade is for bbls. of good quality. We quote $5@7 for plain mess in bbls.; $8@10 for extra do; tcs., $12@16 for prime mess, and $17@20 for India. Beef hams have declined to $47. Cut meats continue firm, strengthened by the steady improved rate of city hogs, which are quoted at 6¾@7c. for packing sizes. Smoked hams, 13@17c.; city pickled hams, 11@10½c.; shoulders smoked, 9c.; shoulders pickled, 8½c.; bellies, 8½c. Bacon is a shade firmer for spot long clear, quoted 8A@8½c. Forward trade has sprung up again, and short clear for Jan. is quoted at 8¾c. A liberal trade of about 5,000 boxes was recently done for Dec., Jan., Feb. and March, on private terms. Lard is very weak, Western quoted at 8¾@8½c. for Oct., and 8½c. for Nov. City has advanced to 8½c., having ruled most of the week at 8¼c.

Seeds.—Grass are in light demand and timothy is lower. Timothy is selling at $3.75. Clover at 9¾c. for Ohio, 10¾c. for Indiana and Michigan, and 10¾ for State. Rough flax is lower, quoted at $1.95.

Sundries.—Small lots of honey quoted at 20@28c. for dark and 25@30c. for light, in glass boxes; mixed lots, 21c. Cider plentiful, at 8@10c. per gal. Feathers, live geese, new, fine, ℔ lb., 60@70c.; do. mixed, 40@50c.; hen, 70@8c; vinegar, cider, ℔ gal., 20@25c.; do. manufactured, 15@20c.; newspapers, ℔ lb. 1@1½c.; white rags, 6@6¼c.

Tobacco.—Kentucky leaf is in fair demand from the home trade. The reports from the new crop indicate a poorer quality than last year, but a very fair yield. Seedleaf is in light demand, the home trade are pretty well supplied.

QUOTATIONS—NEW CROP.

	Light Grades.	Heavy Grades.

Wisconsin and Western	9	@10 c.

Vegetables.—Best lots Irish Potatoes bring firm prices with a quick sale. Other lots dull, and in the buyer's favor. Sweets are in the buyer's favor, with a fair supply.

Early Rose, bbl., $1.50@2.12; Jackson White, $1.50@1.75, Peach Blows, $2.25@2.50. Tomatoes, 60@75c. Squash, per bbl., $1@1.50 white and yellow. Cabbages, $3@10. Onions, red, ℔ bbl., $2.50@2.75; yellow, $2.75@3. Sweet potatoes, $3@3.50. Pumpkins, $7@8. Garlic, per 100 bunches, $10@12. Russia turnips, ℔ bbl., $2@2.50.

Whisky—Is steadily held at 92c. for Western.

Wool.—The market is weak. There is very little inquiry, and there is a fair amount of stock on sale. Latest sales are of Wisconsin fleeces at 58c.; Ohio do., 58@62½c.; California, 30@31c. We quote fleece at 50@55c. for New York and Michigan; 52@55c. for Ohio; 50@55c. for Indiana and Wisconsin; 47@50c. for Illinois; 50@55c. for Texas, fine; 30@35c. for do. coarse. Pulled, 50@60c. for extra.

LIVE STOCK MARKETS.

NEW YORK, Oct. 5, 1872.

THE weather is now more favorable, and stock comes in less freely, so that the tone of the market is improving. Poultry and game begin to dispute with meats, the game laws having terminated for the season, and already grouse, quail, rabbits and many of the snipe family are found in quantity in the markets, while the weather permits sending dressed poultry from the West.

RECEIPTS OF LIVE STOCK.

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.
Totals this week	8,759	80	2,190	28,137	40,252
" last week	10,111	68	2,911	38,485	45,134
Average last year	7,187	88	2,301	25,132	25,177

Beeves.—With a very full run of cattle, though some 1,400 less than the previous uncommonly large supply, beeves are now selling quicker, and at ¼@½c. advance from the closing rates last Monday, when the market was just as bad as it could be. Texans have improved most, this stock which completely glutted the market at 7c. are now worth about 8c. Some good ones are selling at 9c. Thinnish native steers have improved least. They are not more than ½c. higher than when last reported. There is a scarcity of really prime stock, and 11c. is easily obtained for fat animals. Quite likely still higher figures will be reached on Monday. The close is somewhat strong with yards well emptied.

The following are the closing prices for the week in comparison with what cattle brought one week ago, for net weight of beef:

	This week. Cents.	Last week. Cents.
Choice beeves, ℔ lb	13¾ @ 14¼	14 @ 14¾
Good to prime	12¾ @ 13¾	12¾ @ 13¾
Medium	11 @ 11¾	11¾ @ 12¾
Poorest grade	7¾ @ 10	7 @ 10
Average sales	11¾ @ 11¾	11¾ @ 12

Hogs.—Arrivals are lighter and the market is now improving after a dull trade for a few days. Live sell at 5¾@5¾c. and dressed at 6¾@7¾c. Jersey and State going at 7¾@8½c.

Milch Cows.—Trade is still dull, though it is not quite so hard work to run out a pen of cows. Prices are rather stronger, but we still quote at $35@65, with few prime milkers at $70.

Sheep and Lambs.—With quite a falling off in numbers, sheep have added about ½c., while lambs show an advance of strong ½c., fat ones going at 9c. and a few extra State, 71 lbs., at 9¼c. Canada fat lambs have sold at 8½c. by the car load, and a few of them, 74 lbs., went at 9c. Thin Western lambs run down to 6¾@6¾c., a few very poor at 6c. Sheep range at 5@6¾c., with small sales of choice at 7c., as one car 88 lbs. Ohio, went at that price. Large sales of thin sheep are being made at 5@5½c. Farmers appear to be getting rid of that kind of stock early.

Veal Calves.—These have advanced ½c. per lb.—that is if they are good. Grass calves have been sent in somewhat freely in anticipation of cooler weather and falling feed. They sell at 5@4½c. per lb. when weighed, or $6@10 per head. Fair to good state milk veals go at 8½@9¼c., with prime at 10c., and a few extras, with a good many Bucks Co., Pa., at 10½c.

LATEST.—Monday, October 7, 4 P. M.—Beeves.—Arrivals to-day, 158 cars at Communipaw, 106 at 100th St., and 76 at Weehawken, making 5,785 for the present market. Fat matured cattle were scarce and firm, but inferior and common natives and Texans were dull. Good cattle were a shade higher, but other grades were unchanged.

Sheep and Lambs.—Arrivals for to-day's market, 7 car loads at Communipaw, 20 at 45th St., and 11 at 40th St., making 3,352 on sale. Trade was fair, and a large business was transacted at 6¾@¾c. for lamb, and 5@7c. for sheep.

Hogs.—Receipts to-day, Sunday included, 69 car loads at Communipaw and 80 at 40th St., making 15,376. Live hogs were in demand at 5¾@5¾c., and dressed were steady at 6¾@7c., with pigs selling at 7¾@7¾c.

SPECIAL NOTICES.

RUPTURE CAN BE CURED

without suffering. ELASTIC TRUSSES are superseding all others. Before buying Metal Trusses or Supporters, send for a descriptive circular to the ELASTIC TRUSS Co., No. 633 Broadway, New York.

"FAMILY FAVORITE!"

THE

WEED. WEED.

The most perfect, reliable and generally useful machine in existence. For the family of the farmer or mechanic, where the work required of a sewing machine ranges from the heaviest garments of men's wear to the most delicate and ornamental fabrics for ladies and children, it has proved itself thoroughly efficient and entirely satisfactory. Of unequaled simplicity and completeness of construction, capable of being learned and operated with one-fourth the usual expenditure of time and labor, with a capacity for quantity, quality and variety of execution beyond its competitors, and a reputation for durability and reliability known and appreciated by thousands, it is offered to the people for the most critical inspection and comparison, with confidence that its obvious merits cannot fail to convince the careful examiner of its superiority. Manufactured by the

WEED SEWING MACHINE CO.,

HARTFORD, CONN.

WILLARD'S PRACTICAL DAIRY HUSBANDRY: A Complete Treatise on Dairy Farms and Farming, Dairy Stock and Stock Feeding, Milk, its Management and Manufacture into Butter and Cheese, History and Mode of Organization of Butter and Cheese Factories, Dairy Utensils, Etc., Etc.

BY X. A. WILLARD, A. M.,

Dairy Husbandry Editor of Moore's Rural New-Yorker, Lecturer in Cornell University, Maine Agricultural College, Etc., Etc.

THIS is the most full, practical and reliable work on Dairy Husbandry extant; indeed the only one which describes the recent great improvements in the Dairy Business. It is highly commended by leading Agricultural and other influential journals, and must speedily become (in fact is already) the *Standard and Only Authority*. It will pay every one engaged in any branch of dairy business, or who keeps a single cow, to obtain and study this work.

PRACTICAL DAIRY HUSBANDRY embraces **546 Large Octavo Pages,** is handsomely and fully illustrated, printed on superior paper, and elegantly bound. It is a Subscription Book, and a liberal commission is given Agents who canvass Counties, &c. The Agents of the RURAL NEW-YORKER (especially those in Dairy regions) will do well to try the sale of this work. To any person residing where there is no Agent, or who cannot wait for one, the Publisher will send a copy of the work, post-paid, on receipt of the price, $3—(or for $5 the book and RURAL NEW-YORKER one year.) Address

D. D. T. MOORE, Publisher,
5 Beekman St., New York.

THE PEOPLE'S PRACTICAL POULTRY BOOK: A Work on the Breeding, Rearing, Care and General Management of Poultry.
By WM. M. LEWIS.

THIS is one of the finest gotten-up works on the subject on which it treats, for its size and price, of any publication of the kind in this country. It is finely and profusely illustrated, and printed and bound in extra style. Contains 221 large octavo pages. Sent, by mail, post-paid, for $1.50. Address

D. D. T. MOORE, Publisher,
5 Beekman St., New York.

MONEY IN THE GARDEN: A Vegetable Manual, Prepared with a view to Economy and Profit.

THIS Work upon Kitchen and Market Gardening, and the Field Culture of Root Crops, is by P. T. QUINN, Practical Horticulturist, (Author of "Pear Culture for Profit,") and should be owned and studied by every one interested in Gardening. It is an able, practical, profusely Illustrated work of 203 12mo. pages. Sent, post-paid, for $1.50. Address

D. D. T. MOORE, Publisher,
5 Beekman St., New York.

ALLEN'S AMERICAN CATTLE: Their History, Breeding and Management.

EVERY breeder or owner of Cattle should have this work by Hon. LEWIS F. ALLEN, Ex-Prest. N. Y. State Ag. Society, Editor of "American Short-Horn Herd Book," &c., &c. It is a handsomely illustrated and well printed and bound volume of 523 duodecimo pages. Mailed, post-paid, to any address in United States or Canada, on receipt of reduced price, $2.

Offers his services to inventors in securing Patents at moderate rates and in the shortest possible time. Address, for full information, at 128 Broadway (Room 11), New York City.

$500,000 IN BANK.
GRAND GIFT CONCERT.
Postponed to December 7, 1872.

THE SECOND GRAND GIFT CONCERT in aid of the PUBLIC LIBRARY OF KENTUCKY, announced for September 28, has been postponed to December 7, 1872, because the accumulation of orders the few days before the drawing made it physically impossible to fill them without a few days' delay, and as a short postponement was inevitable, it was determined to defer it to a time that would make a full drawing sure by the sale of all the tickets.
The money necessary to pay in full all the offered gifts is now upon deposit in the Farmers' and Drovers' Bank, as will be seen by the following certificate of the Cashier:
FARMERS' AND DROVERS' BANK, LOUISVILLE, KY., Sept. 26, 1872.
This is to certify that there is now on deposit in this bank over half a million of dollars to the credit of the Gift Concert Fund, $500,000 of which is held by this bank as Treasurer of the Public Library of Kentucky to pay off all gifts to be awarded at the drawing.
R. S. VEATH, Cashier.
1,000 Prizes, amounting to
$500,000 IN CASH
will be awarded, the highest prizes being $100,000, $50,000, $25,000, and down in regular gradation to $100, which is the lowest.
The drawing will positively and unequivocally take place December 7. Agents are peremptorily required to close sales and make returns November 25, in order to give ample time for the final arrangements. Orders for tickets or applications for circulars should be addressed to
Gov. THOS. E. BRAMLETTE,
Agent Public Library of Kentucky,
Louisville, Ky.
N. Y. Office, 689 Broadway, under charge of Major Thomas H. Hays.

Agents Wanted.

Goux Absorbent Closet & Urinal,
SANITARY—CONVENIENT—PROFITABLE
In Public Institutions, Schools, Manufactories, Farmers, Gardeners and others.
The Goux Fertilizing & Sanitary Co.
offer, by the use of their Patent Absorbent Closets and Urinals, a method of collecting, deodorizing and utilizing human excreta, at once convenient, inoffensive and economical.
The liquid is separated from the solid excrement by absorption, all the valuable properties of each are retained, and the product is an invaluable manure.
For explanation and practical exhibition of the system, call at Office and Warerooms of Company, corner of Varick, Vestry and Canal Sts., New York.

This Machine with present Improvements is guaranteed to meet every want of the household, for either plain or fancy work. It knits all sizes of stockings and Socks, with heel and toe complete, and is a never-ending source of amusement to ladies of leisure, as well as profit and easy support to those that require it.
Agents wanted every where by the BICKFORD KNITTING MACHINE COMPANY. DANA BICKFORD, President and General Business Supt., 689 Broadway, New York.

THE STANDARD IN THE VAN!

All other Church Music Books, of whatever degree of excellence, are respectfully invited to fall in the rear of

THE STANDARD!

Our NEW COLLECTION OF MUSIC FOR CHOIRS, CONVENTIONS and SINGING SCHOOLS. It cannot be excelled in quality, and intends to lead in circulation.

Sum of the Merits.—Short Theory. Abundant Material, Sacred and Secular, for practice. Excellent set of Metrical Tunes, *in large clear print and not crowded*;—a great advantage. Unusually good collection of Anthems, Set Pieces, &c. The compilers, Messrs. L. O. EMERSON of Boston, and H. R. PALMER of Chicago, are perhaps the most skillful men of their time in adapting music to the wants of the "singing" public. *Price*, $1.50. Specimen copies sent, for the present, post-paid, for $1.25.

A Perfect Success! The printers cannot keep pace with the demand! Ditson & Co.'s

Gems of Strauss!

By JOHANN STRAUSS.

It is a large book (of 250 pages, full sheet music size), filled with the best Strauss Music. Waltzes, Polkas, Quadrilles, &c., including those performed in this country under the direction of the great composer.

About $10 worth of music are included in the "Gems," which are, however, sold for the diminutive price of

$2.50 in Boards; $3 in Cloth. Sent, post-paid, for the retail price.

AGENTS WANTED.

"EAGAN'S COMPOSITION."

(Patented March 5, 1867.)

Used in laying streets, roadways, sidewalks, in lining cellars, cisterns, vats, and in the manufacture of sewers and sewer-pipe, water-pipe, drain-pipe, gas-pipe, roofing and architectural ornaments.

STREETS.

Eagan's improved Macadam pavement for streets is destined to take the place of all other forms of pavement, for the reasons, viz.:

It is cheaper, more durable, more easily and perfectly repaired. Is impervious to water, and no atmospheric change will affect it.

It is free from mud and dust, and is noiseless.

It is smooth without being slippery, and has sufficient elasticity to make it the easiest pavement known for animals to travel over.

DURABILITY.

The reason a Macadam road does not last longer is because the stones are loose and rub and grind upon each other—dust and mud is the result. Eagan's Composition holds the rocks firmly together, thus completely remedying this evil, and continuing the wear of the road to its surface.

SIDEWALKS.

Eagan's Composition is peculiarly adapted for sidewalks and lawn walks, private roadways, gutters, etc. It can be made into blocks and laid in squares or diamond form, or made one continuous sheet, covering arched work more perfectly than the largest flagstone, and at one-fourth the expense.

Walks made of it have a smooth, hard and even surface, pleasant to walk upon, always clean and free of ice, and of as great durability as if made of the best flagstone. Sidewalks made under Eagan's patent cost but little if any more than if made of plank, and are as durable as rock.

ROOFING,

Made of this composition, is far superior to the common felt roofs that are made of gravel, felt, coal-tar and pitch. The latter is liable to run in warm climates and to crack in cold. By the peculiar chemical combinations in this composition both of these objections are obviated, and a roof produced equal to slate, at a cost of about one-third as much per square.

CELLAR BOTTOMS AND SIDES,

Lined with this composition, from one to two inches thick, keep perfectly dry and warm in winter and cool in summer, and are rat and vermin proof.

FLOORS.

Floors made of it may be painted any color; and are as pleasant to tread upon as if made of wood.

CISTERNS AND VATS.

Eagan's Composition is impervious to water and insoluble in acids, making it just the thing for lining vats in breweries and manufactories of most kinds. It is equally well adapted for cisterns, much better than the best hydraulic cements, and not subject to decay from any cause.

PIPING.

Piping made of Eagan's Composition has been in use for five years in San Francisco, Cal., where it was first invented. It has given entire satisfaction, almost entirely superseding all other kinds of piping for sewers or drains. It is easily and cheaply made, and has the advantage of being made at any place without a great outlay of money for machinery, tools, buildings or materials.

Pipes can be made of any required size, are cheaper, and will sustain a greater external or internal pressure than any other kind of cement pipe.

CEMENT.

As a cement it is acknowledged, by scientific men who have examined it, to be the strongest known. A wall built of brick or stone, and this cement used as a mortar, would be perfectly solid as if made of a solid rock.

SEA WALLS.

Sea walls can be built with this material in combination with broken rock, more rapidly and cheaper than in any other way

DIPLOMAS.

First premiums have been awarded to Eagan's Composition from the following Fairs:

California State Fair, at Sacramento, Cal., 1868.
Mechanics' Institute Fair, San Francisco, 1868.
Sonoma County Fair, at Petaluma, Cal., 1869.
St. Louis Agricultural and Mechanical Fair, at St. Louis, 1869.
New Jersey State Fair, 1870.
It has been exhibited at no other Fairs.

RECOMMENDATIONS.

OFFICE OF UNION RAILROAD COMPANY, ST. LOUIS, Mo., 28th March, 1871.

This specimen of Pacific Concrete, (Eagan's Patent,) was taken from the Union Street Railroad of St. Louis, Mo., where it has been in use since December, 1869. Since that date the teams of the railroad have passed over that portion of the track where the concrete is used, 300 *times each day*, while that same portion of the track is constantly used by other teams and vehicles of the city. This pavement has received no repairs whatever, and shows but little wear after constant use for sixteen months (now 22 months). In summer it is free from dust, and in winter brings with it no inconvenience from snow and ice. The Macadamizing at either end of this block of concrete is renewed three times each year, is soft and wet when much water is used, and in all probability will require such renewing for several years to come before the concrete needs repairing. The block of Pacific Concrete in the track of the Union Railroad has given entire satisfaction. WM. STORK, Sup't.

This Company will take contracts in any city of the United States to make Macadamized Pavements, and will guarantee them to last twenty years, and keep them in repair for a small percentage. Will also supply orders for Drain, Sewer, Water and Gas Pipe. Roofing for sale.

TO INVESTORS.

To those who have funds to invest in large or small amounts, or who wish to increase their income from means already invested in other less profitable securities, we recommend, after full investigation, the Seven-Thirty Gold Bonds of the Northern Pacific Railroad Company. Bearing seven and three-tenths per cent. gold interest, (equal now to 8¼ currency,) and sold at par, they yield an income considerably more than one-third greater than U. S. 5-20s. They are Coupon and Registered, the lowest denomination being $100, the highest, $10,000.

Nearly one-third of the Main Line of the Road will be completed and in operation with a large business the present season. All the property and rights of the Company, including a most valuable Land Grant, averaging about 23,000 acres per mile of road, are pledged as security for the first mortgage bonds now offered.

All marketable stocks and bonds are received in exchange at current prices. Descriptive pamphlets and maps, showing Route of road, Connections, Tributary Country, &c., will be furnished on application.

Floricultural.

EUCHARIS AMAZONICA.

THIS is a stove plant rapidly growing in favor, and is almost as indispensable in a stove collection as the Lily of the Valley and the White Camellia to a bouquet maker. In England it is the rival of both of the flowers named. A very successful grower of it attributes his success to heavy waterings occasionally with mild liquid manure, a genial stove temperature, and repeatedly syringing them when in a state of growth.

The Garden, from which we copy the illustration, says:—It is another illustration of the fact that cultivators generally have a poor idea of the true requirements of plants as regards moisture at the root when in a growing state. The splendid specimens we allude to, like other things grown by the same skillful cultivator, were not, when in want of water, simply watered once, but the first was considered merely a preliminary dose, and two others given. The fact is that, instead of the common statement made so repeatedly in the gardening journals that most plants perish from over-watering, being true, the opposite is the case. Most pot plants that die perish from insufficient watering. Let it not be inferred from this that we recommend frequent waterings; one thorough one will save a dozen dribblings such as gardeners too often give, and therefore save time, and be far more effective and wholesome for the plants.

DRACÆNAS.

EARLY in last November I placed in my sitting-room a plant of *Dracæna terminalis*, rich in the brilliant color of its leafage, and though the room sometimes had a fire lighted and frequently had not, and the escape of gas was such as to destroy Cinerarias and Primulas in a few days, the Dracæna remained fresh and beautiful until May. Most, if not all, the Dracænas would do the same, as would almost all coriaceous-leaved plants not natives of hot countries. The secret of this success with foliage plants is constant washing. Twice a week, if not more frequently, the plant had its leaves sponged on both sides with warm water, occasionally using a little common soap in the process, and to this we attribute its continued healthy appearance. Dust and a bad atmosphere are the great drawbacks to plant cultivation in rooms. Hence, plants that have woolly leaves which collect the dust and hold it, never do so well either indoors or in the open air, in towns, as those which have smooth ones from which the dust is washed with every shower.—L. E., *in Garden*.

EUCHARIS AMAZONICA.

FLORICULTURAL NOTES.

Flowering or Japan Quince.—Mrs. B. has a flowering shrub known as Japan Quince. It is ten years old, large, fine and thrifty. It has always honored her call for flowers, and this year yields a respectable quantity of fruit—say 20 to 30. It resembles the common quince of commerce; it is not equal to the cultivated fruit; is more pointed at the blossom end than either. We have never seen or heard of any fruit on that shrub before, have you?—D. R. BARKER.

IT is not an unusual occurrence for the Japan Quince (*Pyrus Japonica*) to produce fruit; in fact we know that a majority of the very old plants in this part of the country bear nearly every season. The pink flowering variety, however, is far more productive than the deep scarlet or semi-double sorts. The plants only require age to insure productiveness; but we do not think the fruit is of any value, being quite hard and tough, although possessing a delicious, spicy fragrance.

Amaranths and Cockscombs.—These flowers, when well preserved, are very nice for floral ornaments in the Winter. They should be picked when fully matured and before the seeds begin to ripen and dried in the dark, the stems tied together and the flowers suspended heads downwards. There are so many colors and varieties and shapes, that quite a charming bouquet can be made of them. They mingle with other everlasting flowers and ornamental grasses very nicely. The satin-like leaves of the plant called "Honesty" are very unique, and the seed vessels of *Scabiosa Stellata* are no less curious if not so pretty.

When the frosts of Autumn have robbed the floral pets of our gardens of their beauty, and the snows of Winter cover their graves, we shall appreciate the bright rich hues of Amaranths and Cockscombs.—LORETTA E. KNAPP.

Potting Plants.—A plant should not be potted when it is very dry, nor when soaked with wet. In the former case, it is very likely to remain dry, as the water will pass through the fresh soil without penetrating into the old ball of earth. When the roots are thickly interwoven, they should be carefully disengaged, that they may be spread out into the fresh soil; but in shifting young, healthy, growing plants, the roots which may be reaching the side of the pot, should not be disturbed, as it is important to preserve the smaller fibers, upon whose action the health of the plant chiefly depends.

One Petunia.—I always did have good success in growing Petunias, but this year I have one that exceeds anything I ever saw. The plant is of the Countess of Ellsmer variety. At one time I counted over 600 blooms; the plant covered over 16 square feet of ground. It is quite a good-sized flower garden of itself.—M. J. W. M.

Viola Pedata.—EMMA R. is informed that this is an American species, very handsome and quite distinct from other American violets. It is perennial.

The Herdsman.

FOOT-AND-MOUTH DISEASE—REMEDY.

A WRITER in the London Times assures us that the following is a cure for foot-and-mouth disease, having himself witnessed the effects of it upon upwards of a score of cattle:—1 ounce of chlorate of potash, dissolved in 1 quart of water, adding 8 drams of camphorated spirits of wine when about to administer the dose. This is to be continued for three days, and half the quantity for sheep and calves for the same period. In the case in which the correspondent observed it to be effectual, the mouths of the animals had previously been cleansed by an application of a solution of alum and tincture of myrrh. For a time, he tells us, "the animals could eat nothing, but were very thirsty, and as a substitute for water, or in addition to it, he put into a tub ground linseed and toppings, pouring upon it boiling water, and letting it stand for an hour or two and then filling up with water, making altogether about 90 or 100 gallons of nourishing gruel. The animals drank this with great avidity in less than 24 hours; and on the following Wednesday they fed freely upon cut cabbages and lucerne, mixed with meal, malt-combs, and chaff. On the Friday their mouths were clean, and no lameness followed which required attention. The medicine was given for four successive days." The writer recommends all breeders and feeders of cattle to use lucerne and cabbages instead of clover and tares, the latter of which he says are not comparable with the former in feeding qualities upon light land farms.

HERDSMEN NOTES.

To Prevent Black-Leg in Cattle.—Very early in Spring, before the yearlings are turned out to grass, take one part of garlic, one part sulphur and two parts of lard; cut and bruise the garlic and mix all together. Take a sharp knife and make an incision just through the skin of the animal's neck and work the finger so as to make a little sack between the flesh and skin. Put in of the above mixture a little piece about the size of a hickory nut, and the work is done. It will soon be absorbed and heal up. It will be some time before the animal's flesh is fit for the butcher.—J. HIRD, *Iowa Co., Wis.*

Can your Readers tell me if they have ever steamed corn stalks for milch cows; if so, with what result in milk production?

Field Crops.

STEAM CULTIVATION IN LOUISIANA.

Mr. E. Lawrence, Magnolia Plantation, Plaquemine, La., has made the following statements of the results of his use of steam in the production of sugar cane. It will be read with interest:—

Two hundred and twenty acres of my cane crop, one hundred and forty acres of which were plant canes, and eighty acres first-year rattoons, were, I believe, as thoroughly plowed and cultivated by steam as could be desired. The plant canes were grown upon land which, after yielding a crop of corn, was again broken up by the steam-plow 26 inches deep; then, during the Winter, laid off in rows fully 8 feet apart and 8 inches deep. In the month of February the cane was planted and covered carefully with a hoe. I avoided carting the seed cane for plants upon the land, carrying it in from each head-land by hand. The seed was good, and was planted in the usual way by laying down three canes in each row. It came up well, giving a perfect stand. In the months of April and May, when the plant cane was about 18 inches high, I subsoiled the crop with my five-tined *steam cultivator* 26 inches deep, twice between each row, working over about ten acres each day. It left the land thoroughly loose and pulverized, and elevated about 6 inches above the level before subsoiling. This, as the canes began to shade it, was clean and free from grass, and thus was obviated the necessity of giving them at this period of the season any more work, which in ordinary cultivation is always requisite. The cane continued to grow with great rapidity, and on the 10th of June, when it was large enough, and the ground sufficiently settled to bear up the mule-teams, I gave it a thorough plowing with our two-mule plows, following with the hoes, hilling and laying it by. Thus the entire crop, with the exception of this last working, was *cultivated and made by steam.*

On the 1st of September these canes were blown down very flat, from which they only partially rose. They cut for the mill, when rolled in December and January, from 7 to 12 feet in length, and this after being frosted so that we had to throw away the first two joints.

The juice weighed but 6½ to 7 degrees Beaume; but under the circumstances the yield was over 3,000 pounds of double-refined sugar to the acre, and had the canes stood up until cut for the mill and been as ripe as our canes usually are, I feel satisfied they would have produced over two tons to the acre, and this upon old, heavy clay land.

The eighty acres of first-year rattoons grown from the stubbles of the *steam-plowed cane*, planted in a similar manner last year, were barred off and well dug in the month of March, then subsoiled and cultivated by steam precisely as the plant canes. The yield was over 2,500 pounds of sugar to the acre, but this was when I only expected to use the steam-plow in the breaking up of the lands. The use of steam for deep subsoiling in the cultivation of the canes, I confess, has far exceeded my expectations, and I am fully convinced that an average yield of even much more will be realized, and this too with less than half the labor now employed under the old system, in which the average yield is not over 1,000 pounds of sugar to the acre. To this may be added the complete preservation of our stubble canes against the cold and Winter rains, so often disastrous to our rattoons.

The advantages of deep plowing and subsoiling by steam over the ordinary cultivation by horses, and the consequent trampling and packing of the ground, can hardly be overestimated. It enables the land to absorb the heavy rains and prepares it for the free admission of air and heat, and thus changes entirely the character of our soils—rendering the heavy clay lands productive and easily worked in seasons of drought, which we are so often subjected to. The crops grown upon deeply-plowed lands sustain no injury. This has been constantly my experience, in fact the steam-plow seems to command the seasons, enabling the soil at all times to retain and transmit moisture, upon which fertility mainly depends. But I fear the prospect at present is not very bright for the extension of steam cultivation in our State. A long war, with the breaking up of the most of our large plantations, the entire destruction of our labor system, followed by scarcity, inefficiency and high price of labor and this by a succession of bad seasons, together with enormous taxation, has to a great extent disheartened our planters and paralyzed their energies; and though they have made almost superhuman efforts to restore their estates, yet to-day we have to witness, lamentable as it is, this once great and prosperous interest almost in its last throes of existence. Many of our finest plantations are now abandoned, and offered for sale without purchasers at less than half the cost of the improvements.

Deep plowing; less land cultivated, and that done much better; the introduction of steam plows and the lands plowed by contract, (where the proprietors do not choose to purchase,) as is now done with eminent success in England and other countries, and a check to our excessive taxations would soon restore us. With this every suitable effort should be made and inducement held out with a view to bring to our fertile lands and genial climate, so rich in promise, the enterprising and intelligent emigrant of every nation. Then, as the future surely indicates, will come a division of our lands with the division of our system of labor. The large and costly sugar-houses will be employed as central factories; capital and labor will blend harmoniously together, and, I trust, a new era will dawn upon our now depressed and struggling people.

In justice to the eminent inventors and manufacturers of double engine steam-plowing tackle and implements, John Fowler & Co. of Leeds, England, I can only say, after three years' experience with two complete sets of their tackle, that the ease and facility with which they are handled, their simple and perfect application of power, and the completeness in every way in which they are worked, entitle them to the high appreciation with which they are now regarded in every part of the civilized world. And I trust the genius of American inventors, which has been constantly but unfortunately directed to the construction of a traction-engine, moving like horses over the land, with plows attached, which must continue to be a failure, will soon be convinced that the *double-engine* system, in which two engines upon opposite headlands, carrying the winding-drum and alternately paying out by single line of wire rope, pull the implement between them, is all that can be desired for the most perfect system of *cultivation.*

Necessity will soon compel us to take a "new departure." The constant increase of emigration and population in the grain-growing States of our country will soon demand a better cultivation and increased production. In England steam power has increased the yield of wheat from 16 bushels to 28 bushels to the acre.

I do not believe the agricultural interest of our country can much longer turn a deaf ear to this last and greatest achievement of steam—its successful application to the cultivation of the soil. It has broken the yoke, and lifted the burden which, for ages, held both man and beast in bondage, ameliorating their condition by making that which was most onerous, easy and attractive; it has elevated labor and dignified the plow.

SHADE FOR THE SOIL.

A. K. Montrose, Logansport, Ind., writes the Cincinnati Gazette:—"I am decidedly in favor of the 'protective system;' I do not wish my land to be plowed deep and exposed to the frosts of Winter or the burning rays of a Summer's sun. Everywhere in a fruitful country the earth is covered by a coat of vegetation which, having reached maturity, falls upon the ground and protects it during Winter. It is to be noticed that where a mound of earth is thrown up before the frosts of Winter come, and then torn down in the Spring, that soil on which the mound rose produces a better yield than the soil adjoining.

"Many farmers are satisfied that fallowing ground is not the best mode of preparing a field for wheat. Fallow ground is usually broken up after corn planting, and then stirred before sowing—enough stock being kept on it during the Summer to keep down the weeds and grass. By such a process the soil is constantly exposed to a hot sun, and nothing permitted to grow that could produce manure.

"Many farmers sow oats or flax in Spring, and gain a crop by doing so. It more than pays the cost of raising the crop. One plowing and two harrowings are necessary for the Spring plowing of a fallow field, and all that is necessary for oats or flax; then stirring for wheat in both cases is the same. Any farmer can see from this that the extra work pays a big profit; the only question that remains is, Which process injures the ground the most? I contend that fallowing does, by presenting the above objections. By raising a crop of oats or flax the soil is protected; something is returned for the extra plowing; the stubble is left for manure, and the ground generally is in a better condition for the coming crop."

The Apiarian.

CHEMISTRY OF HONEY.

A correspondent of the Scientific American says:—The chemical formula for honey is, carbon, 12, hydrogen, 14, oxygen, 14: for beeswax, C, 24, H, 34, O, 2.—Glucose, or grape sugar, is obtained from honey by treating it with alcohol. This sugar is employed in Europe for ordinary sweetening purposes, for confectionery, etc. But the abundance of cane sugar in this country makes its manufacture unprofitable. It has been proposed, and at present prices of strained honey (market quotation in New York ten cents per pound), I should think it might be profitable to manufacture honey into confectionery in this country. I believe it is used largely for this purpose in Germany. As I am ignorant of the process of manufacturing confectionery, except molasses candy, some of your readers may enlighten me upon this branch of industry.

Chemists have given us the foregoing formula for honey, but, when first gathered, honey partakes more or less of the essential properties of the plant from which it is gathered. This essence soon evaporates, if the honey be obtained from certain plants; while from others—buckwheat, for instance—the odor and taste is retained for a great length of time.

The crystallization of honey is an evidence of its purity; but many persons are more fastidious than wise about the food they eat. Honey in the comb is generally preferred, because of its beautiful appearance, and the impossibility of its being adulterated. Still wax is very indigestible, and pure, extracted honey is not only cheaper, but far more healthful and convenient to handle. There is a process for converting honey into wax, but owing to the large amount of honey required to produce a small quantity of wax, the manufacture is unprofitable.

THE BEST BEE HIVE.

At the Bee Keepers' Convention, held at Kalamazoo, during the Michigan State Fair, the above question was submitted to a committee, who reported that the best hive was one with the broad chamber not exceeding twelve inches, or less than ten inches in depth, and to be of such a form that it contains not less than two thousand, and not to exceed two thousand five hundred cubic inches of space; and that the surplus honey space above be of the same size, in order to use the same sized frames, or small honey boxes with frames. That the entrance should be small in Winter, allowing of not more than two bees to pass each other at a time, and the ventilation upward to be regulated at pleasure, as no strong current of air should pass up through the hive, that being highly injurious to the bees. There is no question that this is the best hive; but how much of this is patented is an unsettled question.

WORK OF A SWARM OF BEES.

I have a swarm of bees which, June 16, were in a box hive 12 by 12 inches in the clear. There is a cap on top nearly full of honey. This swarm came out June 16, and were hived. Weight of empty hive, 34 lbs. The hive and swarm weighed:—July—2d, 58½ lbs.; 3d, 59; 4th, 60; 5th, 60½; 6th, 62; 7th, 62½; 8th, 63½; 9th, 67½; 10th, 68½; 11th, 68; 12th, 69; 13th, 70; 14th, 71; 15th, 72½; 16th, 73½; 17th, 74; 18th, 73½; 19th, 72; 20th, 71½; 21st, 71½; 22d, 71½; 23d, 70; 26th, 70½; 27th, 71. August—20th, 72; 24th, 72½; 25th, 73; 26th, 73½; 27th, 74; 28th, 74½; 29th, 75. September—7th, 77; 8th, 79; 20th, 80; 21st, 84; 23d, 87; 28th, 90; 20th, 91; 30th, 90. J. Jackson.

BEE NOTES AND QUERIES.

Introducing an Italian Queen into a Hive.—Mr. Clement of Michigan thus tells how he does it:—"I open the hive and find the black queen as soon as I can, if I want to keep her, otherwise I pinch her head. Then I have the Italian queen ready. Then I smoke the bees and scent them with peppermint and introduce the queen upon a card of brood comb, and then go about my business. I have never lost one queen in a hundred by this method."

Mel-Extractor.—Can you give any information in regard to the machine called Mel-Extractor—for extracting honey from the comb—what it costs and where it can be had, and whether it is a success, patented, and by whom?—S. Haworth.

It is patented by Messrs. Langstroth & Wagner. We do not know what it costs nor where it can be obtained. It is a success, and very generally used among professional apiarians.

Phelps' Bee Hive.—F. J. Sprague, Oxford, Ala., asks for the address of the patentee of Phelps' Bee Hive. We do not know it. Any one who can give it, should address Mr. Sprague direct.

The Sportsman.

CATCHING SHAD WITH A FLY.

Thomas Chalmers, Holyoke, Mass., writes the Turf, Field and Farm as follows: I send you three flies used for shad (I used three on my cast). Two of them are dressed with hackle, one without. They take the hackle more freely. The most deadly fly I have used is a little lighter colored wing, with black spot through, and green body—bright green from peacock tail, brown hackle. The best way of using that I have tried yet is to anchor the boat in or about the edge of a good current, twenty-five or thirty yards above deep water, letting the current carry the fly out to within two or three yards of deep water. It does not matter whether the fly is on the surface or one or two inches under, as they take freely either way.

In casting your fly as in the ordinary way of trout-fishing, you are annoyed with small fish of one and two years old, for as soon as the fly breaks water, every hook is full of the small fry. In the trailing process, you are not troubled enough to spoil the sport.

You want a rod with good spring to recover, and keep taut line when they jump, for a good, lively shad, when hooked, will jump from two to four feet out of water, then make a break of ten or twelve yards before you you can check him. If he cannot go freely, things have got to break. They are game, and fight harder and much longer than either striped or black bass. At the commencement of the season I dress No. 7 hook; as the season advances I come down to No. 4. I find old style Lumreck hook best. Last year I used the Kirby and others, and lost a great many fish with hooks breaking off at barb. This year I used old Lumreck, and at close of season I find four broken hooks.

NOTES FOR SPORTSMEN.

Piratical Fishes.—The Fish commissioners of Massachusetts commend the extermination of two species of fish, known as mud and pond pickerel (*Esox ornatus* and *reticulatus*) They say that "to raise other fish near them is like raising poultry under a hawk's nest. They penetrate even to the cold trout brooks, and devour the young of every species that comes in their way; so they utterly depopulate the waters and convert thousands of the finest fishes into their own soft, muddy tasting flesh. If the State would offer a premium of $5 a cart load for them it would be money well spent." They also state to its other disagreeable qaulities, this fish adds the tendency to multiply females in the proportion of about 14 females to one male.

To Tan Skins and Leave the Fur On.—Remove the legs and other useless parts; soak the skin soft; remove the flesh and soak the skin in warm water for an hour; take for each skin, of borax, saltpeter and glauber salts, each one-half ounce; dissolve with soft water sufficient to allow it to be spread on the flesh side of the skin; apply with a brush, double the skin together and put in a cool place for twenty-four hours.—A. A. A.

The American Widgeon or Bald Pate, is a duck that is a very superior diver, and the companion of the canvas-back during its stay in the Chesapeake and Potomac. It feeds upon the tender root of the valisneria.—R. P., *Baltimore, Md.*

Dairy Husbandry.

ASSOCIATED DAIRYING IN SWEDEN.

We have received accounts, from time to time, of the introduction of the associated system of dairying upon the Continent of Europe, but nothing in detail has been published—until quite recently—by which the American reader could get an insight as to its management, or form an opinion of its success.

The Journal of the Royal Agricultural Society contains an account of the dairy factories of Sweden, furnished by M. JULIEN DANNFELT, Superintendent of the Experimental Farm and Agricultural College at Stockholm. We make a brief abstract of this article, as American dairymen must be interested in learning how these things are managed abroad.

The greater part of the land in Sweden is divided into small farms, which are cultivated by the peasants owning them and on which the number of cows kept for breeding, or for the production of milk, seldom exceeds ten or fifteen. The quantity of milk obtained from the farms is small, mainly on account of the "poor keep" which the animals receive during the long Winter. It is only quite lately that a regular system of dairy husbandry has been adopted, although the nature of the country, the climate, and the manner of living of the inhabitants, are all favorable, it is said, to its advancement.

The Government, as well as the Agricultural Societies, have, of late, taken measures to advance the system of associated dairies, and it is becoming evident to the small farmers that the factories constitute a powerful means of obtaining a considerable revenue from the farms, and much larger than generally results from the practice of other branches of agriculture. As the associated system has given farmers a larger price for their milk than could be realized for it on the private or individual system, this has stimulated them to a more careful treatment of cattle, which, in turn, is reacting in a salutary manner on other branches of agriculture.

The factories are managed sometimes by a single proprietor, who purchases the milk; but the plan that gives the best satisfaction is where the several persons of a neighborhood associate together and establish a factory and have the milk manufactured, dividing the profits the same as on the American plan.

The number of cows delivering milk at the factory ranges from 50 to 200, and will average about 100. The buildings are from 50 to 60 feet long and 25 to 35 feet wide, arranged for milk room, manufacturing room, churn room, cheese room, butter cellar and living rooms for a family. These buildings appear to be somewhat ornamental in exterior, although the cost is not excessive, ranging from $250 to $750. The cost of machinery is no more than $75 in the Northern provinces, but in the Southern sections where a steam boiler and pipes are used the cost amounts to $500.

From the description given of the machinery we should judge that the double bottom cheese tub—an English invention—is used. We examined these tubs in 1866 in our tour among the English dairies, and found them quite inferior to the American vat in every respect, while they are much more expensively supplied with fuel. The other appliances about the dairy are of the English pattern.

For the construction of the buildings and purchase of machinery, loans are made from the agricultural societies, to be repaid within five or ten years at a low rate of interest, or with interest only on a part of a loan.

Generally one dairy woman and a maid are sufficient to do the work; but occasionally a man-servant is employed in addition, to do the heavy labor and convey the product to market. The wages of the dairy women amount to from $30 to $45 per year, and in addition 12 bushels of barley, 12 bushels of rye, 1½ bushels of peas, and several bushels of potatoes, with all the milk, butter and cheese sufficient for her table wants or for her own consumption. The maid servant gets from $15 to $22 per annum in money, and a less quantity of the other products above named.

It is stated that on an average 1 15-100 gallons of milk make a (Swedish) pound of cheese (15 ounces) and 2 8-10 gallons milk a pound of butter (15 ounces). But when the cattle are feeding on the side pastures of the mountains less milk is required for the pound of butter or cheese. The average dividend to the proprietors of the factory has amounted to about 5 pence sterling per gallon, and sometimes as high as 6½ pence per gallon of milk.

More recently a company with large capital has been organized for the purpose of purchasing milk and manufacturing it into butter and cheese. The capital of this company is fixed at £55,000 ($275,000) and the business involves the establishment of branch factories or dairies at places which are in daily communication with the capital all the year round, as well as at other points which are deprived of such daily communication.

The milk from the different farms that have entered into contract with the company for the delivery of that produce, is conveyed every morning and evening immediately after the milking, to the nearest of the sixty stations at present fixed by the company for receiving milk. It is there poured into tin vessels holding about 8 gallons, which are placed in water cooled so as to be from 36° to 40° Fahrenheit, and are left there until the cream is risen. The skimmed cream is conveyed by railway or steamer (during the Winter also on roads) to the central factory, where it is made into butter.

At some of the branch factories where at least 500 gallons of milk per day may be obtained, the company intend to manufacture Cheddar cheese, but at present that description of cheese is not made. The skimmed milk is made into cheese on the Dutch method and now finds a good market at home. The butter, on the other hand, is exported.

It is said the attention which this enterprise has called forth, has given rise to proposals for the forming of several similar companies in different parts of the country, and from which the best results are anticipated.

Thus it will be seen that associated dairying having obtained a foothold upon the Continent, the system must spread and become popular among other nations where soil and climate are adapted to this speciality. How far our export trade in cheese is to be affected by this movement abroad remains to be seen. Much will depend upon the character of goods manufactured and the price at which they can be put in the English market.

The Garden.

GARDENERS' NOTES.

White Apple Tomato.—In the Rural Southland we find a tomato mentioned as new, with this name. This is its first year of fruiting, and it is declared promising. Dr. SWASEY says of it:—"The plant is a hardy, vigorous, drouth-defying grower, and a prolific and continuous bearer—equaling in all these respects the common red and yellow plum tomato. The fruit is of a beautiful creamy-white color, medium in size, of a regular, slightly oblate, apple shape, with a smooth, tender skin and a flesh at once so almost melting in texture, so deliciously fruity in flavor, so devoid of that rank tomato twang that most people are not particularly partial to, so solid and so rich, that one will have to look long and wide before finding another variety that will so completely come up to the highest standard of a first-class table tomato. As a Southerner we are proud of it because it is said to be a Southern variety—and were it not we should esteem it as we do now, the best salad tomato in cultivation."

Club-Root in Cabbage.—This is what an English journal recommends for Club-root:—Frequently change the positions of the crops; dig, trench, and expose the soil well to frost; lime it, or point in a dressing of soot. As regards the plants, transplant them frequently, rejecting all that exhibit protuberance on the roots. A little wood ashes or soot dropped into the holes at planting may also prove beneficial as a preventive; but when once a plant is fairly affected, the best thing to do is to burn it; even if the protuberance is removed the plant rarely comes to much.

Guano-Water on Cucumbers.—It is asserted that weak guano-water poured over the whole of the foliage of cucumber vines in frames infuses great vigor into the plants, and is also a preventive of red spider.

Melons in Georgia.—Augusta, Ga., is reported to have shipped over the Georgia R. R., from July 1 to Sept. 1, 1872, 68,222 watermelons, and 15,782 cantalopes.

The Horseman.

"HORSE TALK" FROM THE CENSUS.

THE N. Y. Commercial Advertiser gives this interesting article under the above heading:

The endless cavalcade of horses and equipages that for hours every day crowds the avenues up town, and pours unceasingly through the drives of Central Park and over the roads beyond, for miles away into Westchester, would alone suggest some examination of the census figures, in order to estimate the expansion of the horse interest during the last few years. But besides the Park and the drives, there is an unending procession of the slow and toiling horses that do the work of the city. They hold down town under a perpetual blockade, and they are constantly passing and repassing in every street. They seem only less numerous than the population. But when we go to the census for facts and figures we are met with a rebuff, which, on the very verge of the inquiry, is quite exasperating, for by one of those blunders of legislation which give force to the advice of OXENSTERN to his son, to see "with how little wisdom the world is governed," the enumeration of live stock "not found on farms" was omitted from the census schedules of 1850. The same mistake was made in 1860, but census takers were requested to ascertain the number of stock not on farms. Again, in 1870, the same blunder was made. This the Superintendent has endeavored to rectify by reference to State censuses, police returns, etc., and the aggregate is given by him in advance sheets of the third volume. To show the perfectly absurd nature of the census returns in the regular tables, we quote the figures for this city and county. New York County is credited with the following live stock:

Horses	323	Mules	4
Cows	284	Oxen	2
Other Cattle	13	Swine	62

and the aggregate value of these herds and flocks and droves is placed at $188,650. Three hundred horses and mules in all New York! The palpable error of the law maker in providing for the live stock enumeration is, however, rectified by the Superintendent of the Census for the whole State, and we find that the total number of horses in New York is as follows:

	1870.	1860.
On farms	536,861	503,725
Not on farms	319,390	92,358

The point to be noticed is the vast increase in horses, "not on farms," which is 226,922 in ten years. For the whole State it is over 260,000. This includes, of course, the village and city horses, and by far the largest portion of it must be credited to New York City, where the increase in horse flesh is one of the most remarkable features of the few years that limit the opening of Central Park, and the progress or completion of other great improvements in roads, etc. We have no means of ascertaining the actual number of horses in this city, but it probably does not fall short of 200,000.

Another fact is worth noting, that the census in regard to the horses of Kentucky, Vermont, and Virginia shows the following result:

	1870.	1860.
Kentucky	351,200	416,913
Vermont	89,015	86,272
Virginia	268,300	330,365

A decrease of 145,035 in these prominent horse-raising States. In nearly all of the Southern States the stock of horses for the ten years shows a very large decrease. Maryland is about stationary at 102,000. A few of the important aggregate figures are as follows:

	1870.	1860.
Whole Country	8,600,219	7,131,688
Illinois	1,017,646	677,899
Iowa	482,786	211,106
Missouri	545,822	442,445
New York	856,241	596,183
Ohio	704,664	625,346
Pennsylvania	611,488	503,831

This table puts Illinois at the head, and New York second, in the list of States. Altogether, the "horse show" is interesting, but we hope that before another census is taken Congress will be wise enough to make provisions for taking a census of all the horses, no matter where they are found. The partial returns got together by the Census Superintendent show that there are in the United States 7,142,849 horses on farms, and 1,547,370 not. In New York and Massachusetts, in Connecticut and most of the Territories, more than half of the horses are not engaged in agriculture.

To Prevent Horse Having a Fit.—Tell "A Subscriber," in RURAL of Sept. 21, page 186, to wind his horse's bit with camphor gum and he will not be troubled with fits again.—P. C. N.

BONE SPAVIN.

I HAVE a valuable horse that has a bone spavin on his hind leg. Can you give me information that will cure it? It is of about two or three months' standing. I saw a notice of Prof. MAGNER's work on the horse, not long since, in the RURAL. Is that the best authority? If so, where can I purchase it and the price? J. H. GATES.

PROF. MAGNER'S work is excellent, but we do not know where it can be obtained nor the price. We quote what follows from it:

The only reasonable treatment for bone spavin is counter-irritation and rest. If there is heat during the first few days, apply cooling applications, such as an ounce of sugar of lead to half a pail of ice water. Keep the leg wet for about two weeks, when it may pass off. A dose of physic should be given. If this stage has passed, repeated blistering with a preparation of iodine or cantharides will be necessary; but much better would be the actual cautery in an operator's hands. Clip the hair closely over a large surface four or five inches above and below the enlargement, and then out to the middle of the back and foreparts of the leg. Any of the strong blisters recommended for spavins, for which formulas are given below, are to be used. If a blister, rub it in well with the hand for ten minutes or more. In two days put on some grease. When the inflammation goes down, wash with warm water and castile soap, and when dry put on more blister, and so repeat, keeping up just as much irritation as you can without destroying the hair. In the meantime the horse must be kept in a comfortable stall, for one of the conditions of cure is rest. Keep up the inflammation in this way for four or five weeks, after which give a run to grass. It is sometimes necessary to blister lightly, if the lameness does not disappear in six or eight weeks, which may be repeated a few times, with iodine ointment in the proportion of one part of iodine to four of lard. Work should be light, if any, within three months. This treatment will usually cure without leaving a blemish.

Treat ringbones on the same principle. Trim off the hair and blister in the same manner, observing the same condition of rest. As regards taking off the enlargement, this treatment is as effectual towards that end as can be used.

Several of the very best recipes for the cure of spavins and ringbones will be found below. Bear in mind you must always clip the hair off of the part to be blistered, and that the medicine must be rubbed in well with the hand for ten minutes:

Very Strong Blister for Spavins, Ringbones, Curbs, Etc.—Finely powdered cantharides, 1 oz.; powdered euphorbium, 2 drams; lard, 1 oz.; tar, 2 oz.

A Very Active Blister for Spavin, Ringbone, Etc.—Two drams corrosive sublimate, 1 oz. lard, ½ oz. tar, 2 drams cantharides. Rub and mix well together.

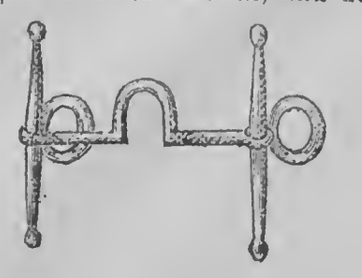
A *Good Blister for Spavin, Ringbone, Etc.*—Biniodide of mercury, ½ dram; cantharides, 1 dram; lard, 1 oz. A fine blister for any purpose requiring counter-irritation and absorption, will take off curbs, splints, etc.

Powerful Absorbing Blister for Spavin and Ringbone.—Equal parts of biniodide of mercury and cantharides, three parts of tar and lard each. Rub in well with the hand for three mornings and use lard after to soften and take off the scab, when it may be repeated if necessary.

NOTES FOR HORSEMEN.

To Keep a Mare's Tongue in her Mouth.—If G. H. T., New Lisbon, O., will procure a piece of elastic band, one-half or three-quarters of an inch wide and fasten to each end of a *straight* bit, so as to form a loop large enough to pass over the animal's nose, and thus keep the bit firm against the upper jaw, he will soon have the satisfaction of seeing his young mare keep her tongue in her mouth. I believe it to be merely a habit which some colts form. —J. M. SHERK.

FRANK H. LARE writes that his father had a horse that had the habit of thrusting his tongue out of the mouth, and he got a



bit made as shown in the illustration (with a crook in it backward toward the root of the tongue) which broke him of the habit.

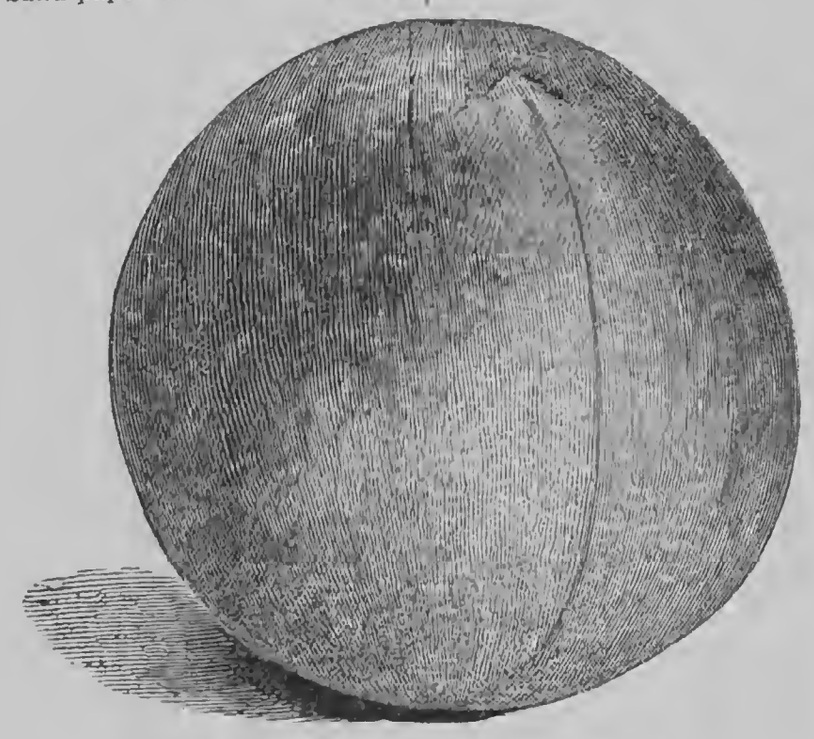
Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

Rapid Growth of the Chestnut.—*Oct.* 1.—Seven years ago, while taking down the old rail fence in front of my place, preparatory to erecting a new board one, I found several small chestnut seedlings among the shrubs, briars and weeds which the former owner had allowed to grow along the roadside in the true shiftless farmer style. The road being quite narrow, I placed the new fence three to four feet inside of the old one, and wherever a promising tree or sprout occurred in the proper place it was preserved for a shade tree. One little Chestnut tree, not more than five or six feet high, I noticed in particular, because it had been twisted or grown in naturally among the rails and was very crooked; but, as it stood in the exact place where a shade tree would be desirable, I carefully disentangled the stem and remarked to my workmen that it would yet be a handsome tree. I have just measured that tree and it is 28 feet high, stem at the base 30 inches in circumference, and at six feet from the ground 20 inches. The stem is as straight as a reed, except a slight crook near the ground. Last season it produced a few nuts and this year the ends of the branches bend with their load of large clusters. This tree has received no care, except pruning, the soil about its roots being covered with a tough sod. Other trees upon my place have made equally as good growth, and I only mention this one for the purpose of showing what might be accomplished in a few years, if a man will only make a beginning. This tree cannot be much more than ten years old, and probably would have been considerably larger under more favorable conditions. An acre of such trees, even in this neighborhood, where chestnut timber is quite plentiful, would be worth more than our farmers ask for their cultivated land. There are plenty of farms within a hundred miles of New York City that would pay their owners fifty per cent. greater profit if planted with chestnut and other forest timber trees, than they do now under cultivation. If I was living at the West, or in fact anywhere else where the chestnut will flourish, I would certainly plant a few trees, if for no other purpose than the pleasure of gathering the nuts. If one is too old or dyspeptic to enjoy the eating of chestnuts, he will not be very likely to forget the time when it was one of the greatest of pleasures. I have sent a small bag of chestnuts by mail to a friend in Montana, and although I doubt if the trees will thrive in that region of country, still the sample sent will make my friend think of old times at home.

Boxes for Insects.—*Oct.* 2.—There are many persons who would like to preserve specimens of insects if they only knew how. A few may be kept in almost any tight box, but unless one is very watchful mites will get in and quickly destroy all; or in damp weather there is danger of moisture causing mould and rapid decay. Of course our professional entomologists have expensive cabinets made expressly for this purpose; but the amateur and novice in this branch of natural science does not feel inclined, even if he is able, to expend several hundred dollars for a cabinet, before being certain that a collection will be obtained that will warrant such a large outlay in cash. Besides this, when a man begins to collect, he can form no idea of where he will end—it may be with a few hundred specimens, but, more likely, if he is a worker, it will be up among the thousands. Then, again, if he follows any of our great authorities, he will want his families, genera, and species arranged according to the published lists; and should he commence putting his insects into a cabinet without any system in their arrangement, he would soon be perplexed to know where to look for, or find, any particular species. If a man expects to accomplish much in any branch of study or business he must systematize his work, so that there will be the least possible waste of time. I use quite a large number of what I call store boxes for my insects, and as they answer the purpose very well, and, in fact, are as good as a far more costly case, I will tell how they are made, and the cost, for the benefit of those who may feel an interest in entomology and desire to preserve specimens in as cheap a way as possible. I send to a cabinet or box manufacturer, and order boxes made of dry pine, three-eighths of an inch thick, twelve by fifteen inches, and three inches deep, inside measure. The last fifty I had made cost but twenty-seven cents each at the manufactory; they were dove-tailed and glued at the corners, and top and bottom nailed on. These boxes were put away in a dry room, and whenever I want any for use I prepare them myself in the following manner:—First, I re-nail both top and bottom, using good, strong, one-inch brads, or finishing nails, for this purpose. Sand-paper and smooth the boxes



THE RICKETTS PEACH.

if they require it; then proceed to cut them open, one inch and a quarter from the top. Two lines should be made as a guide for the saw, an eighth of an inch apart, either with a double-spurred gauge, or two single-spur gauges can be used instead.

After sawing open the box, I plane the edges smooth and down to the gauge marks on both top and bottom. Then I take some thin strips of pine, two inches wide and a quarter thick, and cut them in around the sides and ends of the bottom portion of the box, the edges extending above the edge a quarter of an inch, forming a rabbet which fits closely and tightly against the inside of the cover. The top and bottom should be marked before the box is cut apart, so that it can be put together the same way that it was at first. If the boxes are sawed apart carefully and the rabbet formed as I have described, your cases will be air tight. The bottom of the box is lined with sheet cork, made for the purpose, costing $1.25 per dozen sheets; each sheet being twelve inches long, about 3½ wide and a quarter of an inch thick. The cork is glued in and placed under a slight pressure until the glue is dry. I then give my boxes a coat of shellac varnish inside and outside, with the bare exception of the bottom where it is covered with cork. Gum shellac is dissolved in strong alcohol and in sufficient quantity to coat the wood thinly. Moisture or even water has no effect upon this shellac varnish, and boxes treated in this manner will not shrink and swell with every change in the weather. Over the cork-lined bottom I put good strong white unglazed paper fastened with paste made of pure starch, and then consider the box finished. Boxes made in this form and manner can be stored upon shelves or in any place convenient for examination, and they are readily moved about from one part of the country to another—as circumstances may require; and if a man does the fitting up himself as I do they are not expensive. In appearence they will not compare with a beautiful black walnut or rosewood cabinet; but they will keep specimens just as safely, and that is the main point with the working naturalist.

The Peanut Tree.—*Oct.* 3.—This evening's mail brings me a letter from a New Jersey divine who asks me to send him specimens of various nut-bearing trees, among them one *Peanut tree!* Now it is my candid opinion that a pastor of a church who has not seen enough of this world and its products to have learned that peanuts do not grow on trees or shrubs is not fit to guide souls through this "vale of tears to mansions in the skies." The ridiculous phase of this request was equalled a few weeks since by the pastor of a church in my own neighborhood, who preached a spirited sermon against Darwinism, and then, a few days afterwards, acknowledged that he had never read DARWIN'S works; but the acknowledgment was entirely superfluous to every one his hearers who had read them, inasmuch as his ignorance of the subject was apparent from the moment he began his sermon. I do not know but we expect too much of those who are called learned men; but to one like myself who plods along through life earning his daily bread by hard manual labor, it does seem a little strange that they will talk about things of which they know nothing, even to asking for *Peanut trees*, and at the same time tell us poor farmers that we are very ignorant and ought to come to them for light. Perhaps it is all right, but I am too blind to see it.

My Raspberry Crop.—*Oct.* 5.—In making up my accounts for the season I chanced to come upon the receipts from about an acre of black-cap raspberries. For two or three years past this berry has been almost a drug in the market, and hundreds of acres of good, healthy plants have been destroyed in consequence. This season prices improved a little, or I might say considerable, and I find that after paying all expenses of picking and marketing, I have two hundred and forty dollars left for the crop on a little over one acre of land. They were sold to commission men, although not in New York City markets, but in two smaller cities not far distant. The land upon which these berries were grown is a light, sandy one, and not very rich, and I doubt if I could have made any other crop pay me as well. The small fruit culture has been slightly overdone, in years past, but it is improving and will continue, as those who expected great profits go out of the business.

Pomological.

FRUITS IN NORTHWEST MISSOURI.

SOME years ago, when fruit growers were discussing the possibilities and probabilities of growing fruit in the Missouri Valley, the "Northwest Missouri" was set down as one of the unfavorable sections. But if such persons, who so represented it, would come here the present season, they certainly would be convinced of the error of their ways. At our annual Holt Co. Fair the fruit department display exceeded the expectations of those most interested. The tables were loaded down with over 200 varieties of apples, besides pears, peaches, plums and grapes. At present apples are the principal fruit grown—mostly of the old sorts; but each succeeding year new sorts are added to the list; and such specimens of fruit exhibited I never saw! Were it not for some of the peculiar characteristics, the size would make them unrecognizable. Our County Society is quite proud of such fruits, and is determined that they shall be seen by others, as it intends to exhibit them in competition at some of our District and State Fairs, including that of the great fruit-growing State of Kansas at Topeka. So far the Society has been quite successful. At the St. Joseph Horticultural Society Exhibition, Sept. 12, they carried off the premium for the largest and best collection of apples; also several other premiums upon different varieties. M. J. W. M., Oregon, Mo.

KEEPING APPLES IN PLASTER.

I HAVE been experimenting the past few years with apples, and find those packed in plaster keep much longer than any other way I have tried. I use flour barrels, and find them preferable to apple barrels, as they are made tighter. I first cover the bottom of the barrel with plaster, then a layer of apples, then cover with plaster, and so on till the barrel is full; then put the head in and drive the hoops tight. The plaster being of a cold nature, keeps the fruit at an even temperature, and being fine and dry, packs so close as to keep the apples air-tight. I had Northern Spy and Swaar almost as fresh in May as when they were picked, and found no decayed ones, and think they would have kept till early apples were ripe, had we not used them. Shall put up several barrels for next Spring and Summer use, as I am satisfied that our best varieties, such as Steel's Red Winter, Wagner, and Seeknofarther will keep several months longer than putting them up without plaster, and will retain their flavor much better besides.

Oakland Co., Mich. LYMAN CATE.

POMOLOGICAL GOSSIP.

Lists of Plums.—The Country Gentleman says:—A fruit grower wishes two lists of plums—one of the large, showy, market sorts, and the other of those of high quality, and excellent flavor alone. For the first list, we may name these: Bradshaw, Columbia, Duane's Purple, Victoria, Washington, and Coe's Golden Drop, where it will ripen well. We might add the following, which, although not very large and showy, are remarkable for their productiveness and reliability: Prince's Yellow Gage, Lombard, Monroe Gage, Smith's Orleans, and Reine Claude de Bavay. Among those which are particularly recommended for their excellent quality, are Lawrence, McLaughlin, Green Gage, Schenectady Catherine, Jefferson, Red Gage, Purple Gage, and Red Diaper. The last is a handsome, showy plum, but the tree is a very slow grower. The Yellow Egg, sometimes classed with large showy market plums, rots badly, bears sparingly, and is coarse and of poor quality. Huling's Superb, a large, good plum, is so poor a bearer that it never gives us a dozen good plums from a large, tree, and it should be placed on the rejected list. The preceding selection of desirable sorts will be modified by every fruit grower, according to his preferences, and the peculiarities of soil and locality."

Remedy for Yellows in Peach Trees.—The St. Joseph (Mich.) Herald announces that a remedy appears to have been at last discovered for the yellows in peach trees. The proof, it says, "comes simultaneously from the East, South and West." The remedy is hot water and ashes at the root of the tree. The disease is fungoidal at the root, and hence the application there. The parties attesting to the disease as being fungoidal are John Whittlesey of St. Joseph, Thos. Meehan of the Gardener's Monthly, and Prof. Kedzie of the Michigan Agricultural College. It is confident that the right direction has been reached in the investigation and the remedy, that the application of hot water and ashes has saved many trees, but "certainty has not yet been taken in the eradication and cure of the evil."

Ricketts Peach.—We received, a few days since, a few specimens of this new peach, raised by JAMES H. RICKETTS, Newburg, N. Y. The accompanying illustration is a fairly correct representation of one of the specimens. The color is yellow, with more or less red on the sunny side; flesh yellow, sprightly acid, but rich, very much like Crawford's Late, and the Ricketts is probably a seedling of this old and well known sort. Whether this new peach will prove to be of more value to the country than some of the older ones, can only be known through experience in cultivation; but it is certainly a large, handsome, and promising variety.

The Date.—Please tell me if the date is grown in this country, and are they produced upon a tree or vine.—SUBSCRIBER, *Sussex, Wis.*

DATES are the fruit of a Palm tree (*Phœnix dactylifera*). The Date Palm, as it is usually called, is cultivated in many of our conservatories, but we do not think it succeeds anywhere in the United States, although it may thrive in some portions of the State of Florida.

The Hailey Apple is attracting the attention of Maine pomologists. A correspondent of the Maine Farmer says it originated in the orchard of PELETIAH HAILEY, Topsham, Me.; that the tree is thrifty, hardy, productive, and an annual bearer. The quality is said to be good, but we have no description of the fruit. It is a fall apple, and in eating condition in October.

Farm Economy.

PLOWING DEEP.

Will you answer the following questions consecutively? Do you recommend plowing all soils deeply—that is, inverting it? If so at what season of the year is it best done? Or do you prefer inverting the surface soil a few inches and then subsoiling (lifting the soil without inverting it) and upon what kinds of soil do you recommend this practice? We have had some discussion on this subject at our Farmers' Club and I am curious to know your position.—N. O. S.

1. We do *not* recommend plowing (inverting) all soils deeply. There are many soils which are greatly benefited by being inverted deeply—especially much worn and impoverished soils; or light soils that have a loam or clay subsoil.

2. This kind of plowing is always better done in the Fall if it is designed to seed it in the Spring. But if the seeding is to be in the Fall, (to wheat or rye) it may be done in June or July.

3. As a rule, however, on all soils we prefer turning it three to six inches deep (according as the soil is rich or poor) and lifting it as deeply as possible with a subsoil plow. This work we prefer to do in the Fall, though it will not hurt a Spring crop if it is done in Spring; while deep inversion of the soil in Spring often causes failure of the crop.

ECONOMICAL NOTES.

Filtering Cider.—A Subscriber, Adrian, Mich., asks for information about filtering cider—how to construct a filter, etc. We have never found it necessary to use other than the common straw filter, in use at cider mills; but we have seen it recommended to pass cider, before fermentation, through a filter of sand and charcoal made as follows:—Clear river sand, rather coarse, is best; put the sand and charcoal into a tub or vat for the purpose, in alternate layers, having the coal reduced to pieces from half an inch to an inch square; lay a piece of flannel over the top, and as fast as the cider comes from the press pass it through the filter, whereby all the pomace and other impurities are removed. If the flannel becomes so loaded with pomace as to impede the passage of the cider, it may be removed and washed and a new piece substituted. If this filtration is well done, as the cider passes from the sand it will appear to be perfectly pure, and should immediately be put into casks and placed in the cellar.

Applying Barn-Yard Manure and Ashes.—R. H. R., Berrien Springs, Mich., writes in answer to an inquiry by one of our correspondents:—"I would not put barn-yard manure and ashes on land at the same time. The ashes are an alkali, and the manure, as far as fermentation is concerned, is an acid; the one, I think, counteracts and neutralizes the other." It will do no harm to apply the manure and the ashes to the land at the same time, provided both are mixed well with the soil. Indeed, we doubt if either will effect the other to cause loss, if the land is top-dressed with them, so long as they are exposed to the air. We have mixed ashes and barn-yard manure in making compost, but we were always careful to incorporate plenty of swamp muck with both.

New Way of Tapping Young Maples.—D. B. Wier, not wishing to mar the trunks of his young maples last Spring, and wanting some sap from them, got it abundantly, and of excellent quality, by cutting off some of the small branches, hanging the buckets upon them, and letting the sap flow therein from the cut. It was just as sweet as that taken from the body, and flowed more abundantly during a given time.

Linseed Oil Barrel for Cider.—Can you or any of your readers tell me if a linseed oil barrel will do to put cider in? If so, how would you proceed to cleanse it?—Wm. J. Richardson.

We have never used such a barrel for cider, and can give no opinion, except that we should hesitate to use it, no matter how cleansed.

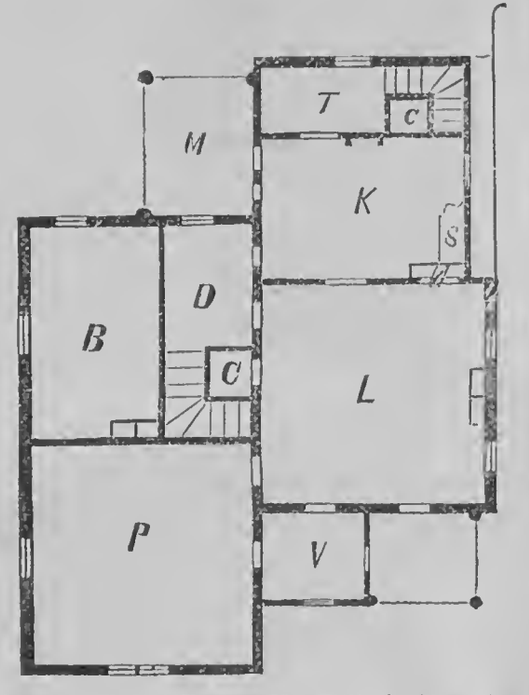
Effect of Snow on Temperature of Soil.—Mr. C. G. Prindle of Chittenden Co., Vt., has made an experiment designed to ascertain how far soil is protected from cold by snow. For four successive Winter days, there being four inches of snow on a level, he found the average temperature immediately above the snow 13° below zero, immediately beneath, 19° above zero, under a drift of two feet deep, 27° above zero.

To Fall a Leaning Tree, chop the lower side half (or more) off; then get a piece of solid timber that will fit where you have chopped, and you can cut the other side without danger of splitting the tree.—M. A. T.

Rural Architecture.

CHEAP COTTAGE PLANS.

This design explains itself. One or two peculiarities need a word. The open stairway in the entrance hall is dispensed with, as it must be, where expense is closely considered, and comfort is put before show. These open stairs so near the front door,

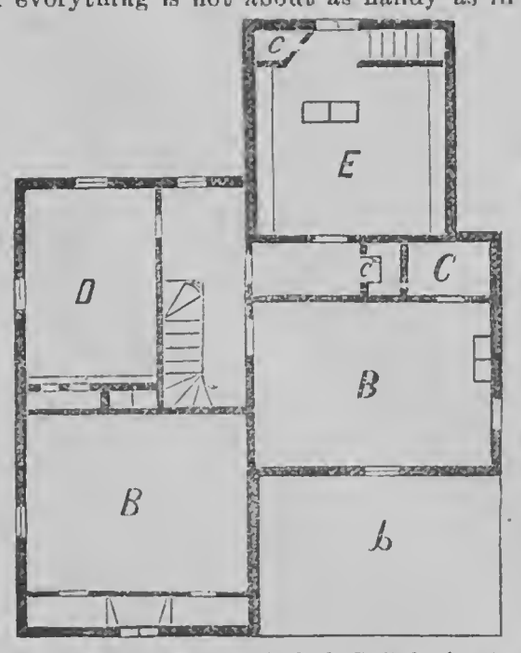


Ground Floor Plan.—V. vestibule; P, parlor, 15 by 13½ ft.; L, living room, 15 by 15 ft.; C, C, closets; B, bedroom, 15 by 8½ ft.; D, panty, 8½ by 6 ft., with cellar stairway out of it; K, kitchen, 13½ by 10 ft.; S, sink; T, bath or store room; N, for books; M, back piazza.

are about the best device possible to make a small house heated by stoves uncomfortable in Winter, especially up-stairs.

Instead is a cheap and snug entrance porch, with narrow window, the stairs being entered from a room always warm, and every inch of what is usually open hall is utilized. In about 15x6 feet getting up stairs, down cellar, and a good pantry and closet. These stairs can, and should have a nice hand rail, which can be made very cheap in an inclosed stairway; 10-inch steps, and 7½-inch risers, are about as near right as any. Let the lower story be exactly ten feet from upper side of lower floor to top of upper floor, giving just fifteen such steps.

It is designed to make the kitchen too small to eat in; and to women who would find fault, and who are accustomed to kitchens eighteen or twenty feet square, where all manner of work is done, and where we enjoy(?) our meals amid sights and smells not calculated to encourage digestion—to such I would say, look round and see if everything is not about as handy as in



Second Floor Plan.—C, C, C, C, C, C, closets; B, B, bedroom, each 15 by 12 ft.; D, bedroom, 15 by 8½ ft.; E, bedroom, 13½ by 15 ft.

your large rooms, with the advantage of a cool, neat room to retire to when overheated or weary, where you can stow your other half and boys out of the way, and above all where meals can be taken amid pleasant surroundings.

Or, if you like, you may consider the two rooms as simply parts of the large kitchen, so divided as to better meet the refinements of the age, while really adding to your comfort and enjoyments. If preferred, the living-room chimney can be removed to the inner side and a double window put in its place. The iron closet is handy, and bath room in a warm place, with closet in it, under back stairs. In Summer the cook stove pipe can go right up the chimney, carrying up much heat; a flue can be carried up with, and separated from, the smoke flue, by brick on edge, with register near the ceiling, to carry away heat, steam, etc.

Two stories is rather high to look well in a house of this size, but a garret for clothes drying in cold or stormy weather is so essential to comfort that it seems best to carry the main wing at least to that hight, making its roof half pitch, with eaves projecting two and one-half feet, shutting down over the sides and reducing apparent hight materially. Garret stairs are over the others, and may be steeper—say nine inches step and eight inches riser, as it is found easier to carry loads up such than to travel further up a more gentle rise.

Cost.—Values of labor and material differ so widely in different parts of the country, that it is scarcely worth while to say anything about cost. Here this design could probably be built, balloon frame filled in with soft brick on edge, from $1,200 to $2,000, according to finish. B. W. Steere.

Adrian, Mich.

Scientific and Useful.

PAINT FOR OUT-DOOR WORK.

A correspondent of the N. Y. Tribune says:—Having had a large practical experience in paints of all kinds, I find the best priming for old wood-work, and in fact all wood-work that is exposed much to the weather, is simply Spanish White, or as it is commonly called, Whiting, mixed in pure, raw linseed oil; let it stand until it is thoroughly mixed, then reduce with oil and add the drier sufficient to dry it. This makes the best, hardest, most durable paint for the first cost, of anything I have ever tried. Reduce it to an ordinary thickness for priming, and apply with an ordinary brush. It must be thoroughly beat together, so as to work out all the lumps of the whiting.

Another correspondent adds: For weather-worn weather boarding take about one-half common whiting, one-half white lead, throw in small portions of red lead and chrome yellow to overcome the blackness of the wood, or add umber for a drab color. Fresh paint is always best. Hence, where persons wish to do their own painting, it is sometimes best to buy the paint dry. Take a board with a smooth surface, find a muller some three inches in diameter at one end, and conveniently shaped at the other to hold with both hands, and you can mix up your paint to answer your purpose. Flaxseed oil is to be used; a little turpentine will make the paint flow more freely from the brush. Small portions of Venetian red and lampblack will do for a dark color, This is the result of thirty-five years' experience.

WHAT WILL ARREST FERMENTATION IN CIDER?

Is there not some substance which will arrest fermentation in cider, and thus enable one to preserve it sweet the year round? If there is, will you oblige us by giving its name and the mode of using it?—W. W. B., *Worcester, Mass.*

Yes, there is such a substance—Sulphite of Lime, which was discovered by Prof. E. N. Horsford of Harvard University, Cambridge, Mass., as long ago as 1858. This sulphite of lime is exclusively manufactured and sold for this purpose. Prof. Horsford gives the following directions for its use:—Put the cider, as it runs from the press, into clean casks, and place the casks in a cool place. Watch the progress of the fermentation from day to day, and before it gets sour, when it tastes just right, put in the contents of this package, first stirring it up with some of the cider in a pitcher. It will soon settle clear, and the cask may be bunged tight, and kept through the Winter, or it may be used as desired. If the cider is cloudy or turbid, beat up half a dozen eggs, shells and all, turn into the bung-hole, and let it rest a few weeks. It will make the cider very nice and clear.

SCIENTIFIC AND USEFUL NOTES.

Black Writing Ink.—An inexpensive, but excellent method of making writing fluid is to take 2½ oz. extract of logwood; 90 grains prussiate potassa; 1 teaspoonful beef's gall, and 1 gallon cold water. Dissolve the logwood in clean soft water; add the potassa and gall; after standing one day it is ready for bottling and use. The color is a jet black and so far as the expense is concerned the ingredients can be obtained from any apothecary for twenty-five cents.—G. R. Drake.

A Recipe for Cement to stop cracks in glass vessels, to resist moisture and heat, is thus given in the Scientific American: Dissolve caseine in cold saturated solution of borax, and with this solution paste strips of hog's or bullock's bladder (softened in water) on the cracks of glass, and dry at a gentle heat; if the vessel is to be heated, coat the bladder on the outside before it has become quite dry, with a paste of a rather concentrated solution of silicate of soda and quick lime or plaster of Paris.

Industrial Societies.

SOME THINGS IN KENTUCKY.

Leaving the great Exposition of Cincinnati, I made my way through Northern Kentucky to Louisville, to take a look at the new Exposition in progress at this place. The Association was formed in the Spring, and the whole thing was conceived and executed within the space of ninety days. The building is a handsome and substantial structure of brick, with basement, and second floor of wide galleries, giving large exhibition room—high, light and airy, with convenient and tasteful rooms for the officers.

The site of this Exposition is in the best part of the city; the lot which contains the building is three hundred and forty by two hundred and fifty feet. It was purchased by the Association at a cost of $98,000, and the building has cost as much more. This first Exposition has already proved a financial success, and I can testify that in its material and display it is a very handsome thing. The show of steam engines and other heavy iron manufactures of the Falls City, the large show of plows for Southern use, and also of carriages and furniture, is highly creditable to the enterprise of Kentucky. Of course, the show of tobacco is large and complete, from the hogshead in leaf to the finished plug and cigar.

Among the visitors in this Exposition I had the good fortune to meet the veteran agricultural writer of the South, Dr. M. W. Phillips, well-known to all readers of Southern agricultural literature, and to all of the old agricultural editors. We had a good sit-down together, and, mercy! how we galloped up and down the pastures of old times, when both of us were a quarter of a century younger than we are today, or ever will be, till we meet "over there."

The clay hills of Northern Kentucky have suffered from drouth, and the crops are light. Corn and tobacco are the staple. The apple orchards are not in such full bearing as I have seen in the North, and the tobacco is much poorer than what I saw in the Valley of the Miamis, in Ohio.

Louisville is a solid, well-arranged, and thrifty city, and with her present and prospective system of railroads, has an assured position among the commercial centers of the country.

S. D. H.

INDUSTRIAL SOCIETIES.

The Pennsylvania Hort. Soc. holds its annual Exhibition at Philadelphia, Oct. 22-25.

The Illinois State Grange of the Patrons of Husbandry is to meet at Dixon, Lee Co., Ill., Dec. 10, 1872, when it will hold a two-days' session.

The Catamount (Pittsfield, N. H.,) Farmers' Club organized August 27th, 1872, with seventy-four members. Present number, 115. *Pres.*—W. B. Drake. *Vice-Pres.*—S. W. Dow. *Sec. and Treas.*—Geo. R. Drake.

The Iowa Agricultural Society offers a premium of $1,000 for the best ten acres of artificial timber, payable in 1881; also $500 for the best cultivated farm, payable in 1875; $250, payable in 1878, for the best mile of hedge.

The Michigan Bee Keepers' Ass'n has elected the following officers for the ensuing year: *Pres.*—T. F. Bingham, Allegan. *Vice-Pres.*—A. C. Balch, Kalamazoo. *Sec.*—J. W. Porter, Ogden. *Treas.*—H. A. Burch, South Haven.

The N. Y. State Grape Growers' Soc., through T. S. Hubbard, Sec'y, announces that the Executive Committee has decided that it is expedient to disband and co-operate with the Western N. Y. Hort. Soc., so far as possible—for the reason that grape growers throughout the State do not seem inclined to co-operate to keep the organization running.

The Illinois State Agricultural Society held its 20th Annual Fair at Ottawa, Sept. 16-20. The exhibition of live stock and implements was large and excellent. The attendance was large and receipts satisfactory. The annual election, held during the Fair, resulted in the choice of the following officers: *Pres.*—John P. Reynolds. *Vice-Pres't's.*—1st Cong. Dist., Lewis Ellsworth; 2d, H. D. Emery; 3d, Jonathan Periam; 4th, James Herrington; 5th, Chas. H. Rosenstecl; 6th, Geo. W. Stone; 7th, Charles Snead; 8th, Emory Cobb; 9th, A. J. Dunlap; 10th, Samuel Douglas; 11th, K. K. Jones; 12th, M. C. Goltra; 13th, S. D. Fisher; 14th, John G. Taylor; 15th, William Kile; 16th, W. H. Russell; 17th, D. B. Gilham; 18th, D. T. Parker; 19th, John Londragin. The Secretary and Treasurer are to be elected by the new Board.

Hygienic Information.

FEATHER BEDS AND HEALTH.

THIS cold weather reminds me of "Mintwood's" anathemas on feather beds, and of the discussion which ensued thereon in the RURAL NEW-YORKER. I agree with "Mintwood" in proscribing them—in Summer—when they certainly *are* an abomination, conducive to no one's health, or comfort either, except the rheumatic invalids, who think they always require them. To be ushered, of a hot night, into the "spare" chamber, closed since the exit of its last occupant, weeks or months ago, perhaps, and stifling with the confined exhalations of an apoplectic forty-pounder, is a most exasperating invitation to repose; and I don't blame any intended victim for seizing and depositing the "flowery bed of ease" in a corner—or, better still, out of the room—and betaking to the straw or husks, or floor beneath. (Why isn't the straw placed uppermost, in dog-days at least?)

But when Summer turns upon us the cold shoulder, and the "spare" room, frost-curtained and fireless, is again invaded, we long, as we don our night-robes, to sink in the billowy warmth of the erst despised feathers.

Chattering as with an ague, we bestow ourselves as quickly as our numbed limbs allow between the sheets of our rigid couch—the fashionably (?) substituted mattress! After the chill of this icy bath has further subtracted vitality, we instinctively lie coiled like a watch-spring on our refrigerator, nestling in vain on its unyielding, inexorable surface, for the warmth we can neither get nor keep.

After an hour or two of alternate cramps and quakes, a sort of torpor benignly overtakes exhausted nature, which we courteously and (not to be outdone by the rest in brave endurance) heroically call sleep! The next night petticoats, waterproofs, shawls, are from our private resources added to the avalanche of bed clothing, and between the Alps on Alps above and the glacier below, the great discovery of HARVEY is a thing we utterly refuse to believe in.

I speak feelingly from experience in all seasons. Widespread as the comforts of life now are, a majority of the rooms devoted to Somnus, in the homes of the *toiling* millions in city and in country, go unwarmed through our long Northern Winters, except those fortunately adjoining, or over the living rooms; and in such the only hope of the devotee is in hanging to the golden goose, and to the warming-pan too, unless they would utilize their physicial heat to first make the bed tenable.

I have known children, of hereditary consumptive taint, in families of narrow means, sleep year after year in a sunless room of Northern exposure, from whose walls in Winter a sweep of the hand would bring down a shower of frosty incrustations. But I don't think through that harsh, poverty-enforced *regime* that they would have escaped in fair health this side the grave to-day, but for their warm and faithful allies, the bed of "*live*" geese feathers, and upon occasion a hot flat-iron from the stove, or billet of wood from the oven, to add to their comfort.

Our oft ensampled grandmamas did not disdain these homely aids, when with straitened means they begun life's battle, and were forced to eke out the comforts; and the health and strength which these now despised aids assisted to cherish was the source of those prodigies of housewifely valor, and of the longevity, traditional in this generation.

In the furnace-heated, perfectly ventilated homes of the wealthy, where warmth is free as air, feather-beds are looked on as fossils, whose place of usefulness and honor is usurped by *more* fitting appliances. If but the same compatibility of arrangements were in obligedly frugal households, where the hoard of earnings numbers but a few hundreds, or thousands at best, one's comfort of mind and of body would not so often be sacrificed to a silly aping of "style."

Common sense dictates *comfort*, and *do*, thrifty matrons, of both city and country (at the North) *let comfort be the fashion*. Don't look upon a *good* feather-bed, well cared for, as an enemy to health, especially if the temperature of your room is indicated by the congealed contents of the ewer, or if there be frost even out-of-doors; and because some individuals of exuberant vitality prefer their baths of ice-water, it does not follow that should all sick and enfeebled folk martyrise in like manner it would be to their advantage. Yours effusively, GUSSIE BASSWOOD.

Cayuga County, N. Y.

HYGIENIC NOTES AND QUERIES.

Remedy for Wounds.—A correspondent of the Country Gentleman gives the following remedy for painful wounds: Take a pan or shovel, with burning coals, and sprinkle upon them common brown sugar, and hold the wounded part in the smoke. In a few minutes the pain will be allayed, and recovery proceed rapidly. In my own case a rusty nail had made a bad wound in the bottom of my foot. The pain and nervous irritation was severe. This was all removed by holding it in the smoke for fifteen minutes, and I was able to resume my reading in comfort. We have often recommended it to others, with like results. Last week one of my men had a finger-nail torn out by a pair of ice-tongs. It became very painful, as was to have been expected. Held in sugar-smoke for twenty minutes, the pain ceased, and it promises speedy recovery.

Asthma Remedy.—S. A. G. writes the Cincinnati Gazette:—My sister has been relieved, if not cured, of asthma by the following: Buy of the druggist five cent's worth of saltpeter, and get also a sheet or two of grayish paper, which druggists have, thick like the common brown paper. Dissolve the saltpeter in half a pint of rain water and saturate strips of the paper in the water and dry it in pans or on plates. Now roll them up like lamp lighters. When a paroxysm comes on, light one and inhale the fumes. If necessary, throw a cloth or shawl over the head. If the saltpeter is very strong it may fuse a little. In that case, more water should be added. The prepared water for saturating the paper may be kept bottled ready for use. If the paper described cannot be got, brown paper may be used instead, but the smoke of the former is purer.

Antidote for Poison.—We find the following commended:—If a person swallows any poison whatever, or has fallen into convulsions from having overloaded the stomach, an instantaneous remedy, more efficient and applicable in a larger number of cases than any half a dozen medicines we can now think of, is a heaping teaspoon of common salt, and as much ground mustard, stirred rapidly in a teacup of water, warm or cold, and swallowed instantly. It is scarcely down before it begins to come up, bringing with it the remaining contents of the stomach, and lest there be any remnant of a poison, however small, let the white of an egg, or a teacup of strong coffee, be swallowed as soon as the stomach is quiet; because these very common articles nullify a larger number of virulent poisons than any medicines in the shops.

Linseed Sirup for a Cough.—We find the following in a chemical journal:—To make linseed sirup for a cough, boil one ounce of linseed in a quart of water for an hour; strain it and add to the liquid the juice of two lemons and a half pound of rock candy. If the cough is accompanied by weakness and a loss of appetite, add half an ounce of powdered gum arabic. Set this to simmer for half an hour, stirring it occasionally. Take a wine glass full whenever the cough is troublesome.

That Consumption Remedy.—In the RURAL NEW-YORKER of July 13, I notice a young lady asks where she can find Cinnduranga bark and Extract of Carragcen, for consumption. I have a young friend ill with consumption, and, seeing Mrs. SOMERBY's recipe, I thought I would prepare it for him; but I failed to get the ingredients here; but on taking the recipe to our druggist, he sent and got them for me, and I am happy to say the medicine is doing him good.—E. F. S.

Chronic Diarrhea.—I have been an invalid all Summer; have tried many physicians and many recipes. I now turn to the RURAL NEW-YORKER for help. I have been ill with chronic diarrhea and general weakness. I would be very glad if any of your readers would give me a recipe that would afford relief.—E. FITZ SIMONS.

Buttermilk is an aid to the digestion of any food taken with it; and by many hygienists is regarded as an excellent substitute for fruit in Winter, and a prevention of Spring sickness. It is especially recommended to invalids who suffer from indigestion—drink it at meal times.

Domestic Economy.

SKELETONIZING LEAVES.

MRS. H. L. S. asks, in RURAL of Oct. 5th, how to prepare skeleton leaves. I skeletonized some several years since, but did not soak them long enough to get the chloride of lime out, and they turned yellow. I then dyed them green, and put them in a wreath with rose-colored and white Acroliniums; but I wanted some white ones this year, for they look more *spiritucllc*. Here is the proper way of preparing:—Gather the leaves as soon as they are fully grown, and before they have had time to ripen any. Most kinds are ready the last of June or the first of July. The easiest to manage are pear and cherry tree leaves; but a variety is desirable. Put in jars and cover with soft water, and set out of doors. If the rains do not supply water to remedy the loss by evaporation, more must be added, as needed. Care should be taken to place the leaves having the most tannin by themselves. Different leaves take from three to six weeks to macerate. When the leaves are ready to take out, the outside coating is loose, and may be broken and removed. This liberates the green substance that colors the leaf. Keep them immersed in water during the operation. Float the skeleton part out on pasteboard, and rinse in clear water, letting them soak, and changing the water often. The very greatest care has to be taken in this kind of work, as one harsh touch will ruin them. Even the gentlest usage will save but a small proportion of the leaves.

After they have been well rinsed, put them in a weak solution of chloride of lime for a few hours, till they look white, but do not let them stand too long. Remove to clear, warm water, and change often for a day or two. Float out on pasteboard and let them dry, and they are ready for mounting. They may be formed into wreaths or bouquets. I had some put up with white wax berries that were admired very much.

LORETTA E. KNAPP.

North Fairfield, Ohio.

ODDS AND ENDS.

Potato Salad.—In some of the German restaurants my husband has eaten of potato salad, which he wishes I could make. Can any of the readers of the RURAL NEW-YORKER tell me how to do it?—MRS. HALCOMB.

WE find the following from a correspondent in the Western Rural:—Cut ten or twelve cold, boiled potatoes into slices from a quarter to half an inch thick; put into a salad-dish with four tablespoonfuls tarragon or plain vinegar, six tablespoonfuls of best salad oil, one teaspoonful of minced parsley, and pepper and salt to taste; stir well, that all be thoroughly mixed. It should be made two or three hours before needed on the table. Anchovies, olives, or any pickles, may be added to this salad, as also cold beef, chicken or turkey, if desired, but it is excellent without these.

Domestic Inquiries.—MOLLIE P. Y., who says she is "a very inexperienced housekeeper," and has just commenced taking the RURAL NEW-YORKER, asks some of the experienced housekeepers "what preparation they use to soak or boil clothes in which renders the getting the dirt out more easy without injuring the clothes." . . . . EMMA J. N. asks for "a good recipe for making tomato catsup" . . . Do any of your readers know how the Germans prepare garlic or onions with which they flavor boiled potatoes and make them so appetizing? I have often eaten potatoes so prepared in restaurants, and think them excellent. I should like my wife to know how it is done.—JOSH BROWN.

Dyeing Blue.—One of your correspondents asks me through your paper how to dye a permanent blue. Dip the goods in a strong solution of alum. Then prepare a small amount of water with Prussian blue, and dip a few rags in it; add a little more blue and immerse a few more, and so on, the amount of blue to be regulated by the shade desired. I have found about an ounce to a pound of goods generally sufficient. The blue dye to be used cold.—L. E. K.

To Pickle Hams and Beef for Drying.—I have used the following formula many years with great satisfaction:—For every 100 lbs. of beef, 7 lbs. of salt, 2 ozs. of saltpeter, 1½ lbs. of brown sugar, 4 gallons of water. Boil and skim, and pour over the meat, when cold. If properly packed, that amount of water will cover the meat. For pork, pack the hams and shoulders together. To every 100 lbs., take 8 lbs. of salt, 4 ozs. of saltpeter, 1½ lbs. of sugar, 4 gallons of water. The hams and beef for drying may be taken out after four weeks. To keep the meat after warm weather, the pickle will have to be boiled.—W. M., *Alton Ill.*,

Quaker Plum Pudding.—My friend KATIE R. P. requests me to send to the RURAL NEW-YORKER my receipe for making "Quaker Plum Pudding," of which she has eaten and pronounced excellent. I take slices of light bread, spread them with butter and lay them in a pudding dish with alternate layers of raisins until within an inch of the top. Five eggs are then well beaten with a quart of milk and poured over the pudding; salt and spice to suit the taste. I bake it twenty to twenty-five minutes and eat with liquid sauce. The raisins should be boiled in a little water before using, and the water and raisins put on the pudding.—MRS. N. V. R., *Minnesota*.

Corn Starch Cake.—Take three cups of flour, two cups of sugar, one cup of butter, one cup of corn starch, one cup of sweet milk, one teaspoonful cream tartar, one-half teaspoonful soda and the whites of six eggs. Stir butter and sugar to a cream; beat eggs well. Sift flour, soda, cream tartar and starch together. Bake slow. I think this makes a very good cake.—ALICE.

Washington Cake.—To four cups of flour add three of sugar, one of butter, one of thin cream, five eggs, and one teaspoonful of saleratus. It makes a good cake.—R. S.

Sheep Husbandry.

WOOLEN STATISTICS.

FROM Washington, Sept. 22, we have the following dispatch:—The complete statistics of the manufacture of woolen goods in the United States, as returned at the Ninth Census for the year ending June 1, 1870, have just been sent to press from the Census office; and exhibit the following totals: Of the 2,891 establishments in the United States there are in Pennsylvania, 457; New-York, 252; Ohio, 223; Massachusetts, 185; Indiana, 175; Missouri, 156; Tennessee, 118; Kentucky, 125; Illinois, 109; Connecticut, 108; Maine, 107; Iowa, 85; New-Hampshire, 77; West Virginia, 74; Virginia, 68; Rhode Island, 65; Vermont, 65; Wisconsin, 64; Michigan, 54; North Carolina, 52; Georgia, 46; Maryland, 31; New Jersey, 20; Texas, 20; Utah, 15; South Carolina, 15; Alabama, 14; Arkansas, 13; Delaware, 11; Mississippi, 11; Minnesota, 10; Kansas, 9; Oregon, 9; California, 5; Louisiana, 2; Florida, 1; and New Mexico, 1. The capital of these 2,891 establishments is reported at $98,824,-531. The number of steam-engines is 1,050, with a horse power of 35,900, and water-wheels with a horse power of 59,332. The number of sets of cards is 8,366, with a daily capacity of 857,392 pounds of carded wool; number of broad looms, 14,039; narrow looms, 20,141; spindled, 1,845,196. The average number of hands employed during the year has been—of males above sixteen, 42-728; of females above fifteen, 27,682; of children and youth, 9,643. The amount of wages paid to these hands during the year is reported at $26,877,575; the total value of the materials used during the year was $96,-432,601, of which the amount paid for chemicals and dye stuffs was $5,833,346. There were consumed during the year 17,311,824 pounds of foreign wool; 154,767,075 pounds of domestic wool; 17,571,929 pounds of cotton; 19,372,062 pounds of shoddy; 2,573,419 pounds of woolen yarn; 3,263,949 pounds of cotton yarn; 1,312,560 yards of cotton warp; 140,733 pounds of warp. The value of all other materials used was $5,070,250.

Among the productions of these 2,891 establishments, are 63,310,612 yards of cloth, cassimeres and doeskins, 58,965,286 yards of flannel, 1,941,865 yards of felted cloth, 2,663,-767 yards of repellants, 2,853,458 yards of tweeds and twills, 14,078,559 yards of satinets, 5,506,902 yards of kerseys, 24,489,985 yards of jeans, 14,130,574 yards of linseys, 1,932,382 yards of negro cloth. Numbers of pairs of blankets, 2,000,430; number of horse-blankets, 58,553; number of carriage robes, 22,500; number of coverlids, 226,744; number of shawls, 2,312,761; number of pounds of yarn, 14,156,287; number of pounds of rolls, 8,683,069. Total value of production, $155,405,058.

The Literary World.

NEW PUBLICATIONS.

How to Educate Yourself; With or Without Masters.—By GEO. CARY EGGLESTON. New York: G. P. Putnam & Sons, 1872.

THIS is one of PUTNAM'S handy-book series; a handsome, compact, rational volume of 150 pages. It is written in a graceful, flowing style, easy to be understood, and directly to the point. The subject-matter of the volume is worthy of all praise, being practical, and full of suggestions of value to all who seek an education. Mr. EGGLESTON divides his book into chapters treating of the following subjects:—How to mark out a course of study; common school studies; collegiate studies; the study of languages; the higher mathematics; physical science; moral and intellectual science; general reading, and how to study and read to the best advantage. We have given the book a careful perusal, and do not hesitate to recommend it as a valuable work for all teachers and students, each of whom will glean much from it of personal advantage. Mr. EGGLESTON takes several "new departures" in the matter of education which will be a surprise to old fogies, but which are good, nevertheless.

The Life of Henry Wilson.—By J. B. MANN. Boston: James R. Osgood.

A HANDSOME and finely printed pamphlet of 120 pages, it contains, in a well-written manner, the early life and gradual growth of HENRY WILSON, from a poor boy up to the Senate Chamber, giving us in sufficient detail an outline of his great work, and the views he holds on important public questions. Those who wish to know more of the Republican candidate for Vice-President than they do now, will purchase this book for 50 cents.

The Hygienic Hand-Book.—By R. T. TRALL, M. D. New York: Samuel R. Wells.

DR. TRALL is constantly making books. Many of his works are repetitious, in part, of former publications. For those who have faith in the water-cure this hand-book will be of use. And for those who wish to know how to make squash cakes and pumpkin bread, ample directions will be found in this work. The tone and drift of the book is very well, and little harm is likely to follow its teachings.

Septimius Felton.—By NATHANIEL HAWTHORNE. Boston: J. R. Osgood & Co.

EVERY one familiar with the writings of this foremost American romancer will be delighted with this new creation from the pen of the strange HAWTHORNE. We call his creation, since it must be regarded purely as a work of art. The characters in the story are unnatural, and the incidents totally improbable. Yet it is well worth reading, if only to discover how an author of genius can work out an ideal. There is much fine writing in the book, and it is handsomely bound and printed.

The Vicar's Daughter. By GEORGE MACDONALD. Boston: Roberts Brothers.

A STORY of quiet domestic life in England, with a diluted sermon running through it. The incidents are simple and told in a pleasing manner. Readers will be interested in the characters of Marion Clare and Roger, who was so foolish as to fall in love with her. The moral of the book is exceedingly good. We judge it will be popular in the drawing-room and by the fireside.

Gardening by Myself. By ANNA WARNER. New York: Sheldon & Co. F. Randolph & Co.

A SMALL, handsome, chatty volume, devoted to the cultivation of flowers. Miss Warner writes in a happy, merry style, is free from sentiment, and speaks of her work as though she loved it. She is practical, and her book will be of much help to many women who would despair of comprehending a larger work. Price, $1.25.

Gems of Strauss.—A choice collection of Dance Music. Ditson & Co., Boston and New York.

A HANDSOME, cheap and complete collection of the Dance Music of that King of the Waltz, JOHANN STRAUSS, with some compositions of his brothers, JOSEPH and EDWARD. Our readers already know the charm there is in many of these, and will be glad to get those they have not heard.

The Adventures of a Brownie.—By the Author of "John Halifax, Gentleman." New York: Harper & Bros.

A DELIGHTFUL little book, full of pleasing stories, told in simple language, calculated to amuse as well as instruct. All little readers will be fascinated with it. The book is beautifully illustrated.

THE MAGAZINES.

THE LAKE MONTHLY of Chicago is an interesting and handsome publication, equal to any magazine in the East. The September number has thirteen valuable articles. The October number will be devoted to "Chicago rebuilt," and is to be profusely illustrated. Everybody who would see what has been done since the fire, should get a copy. It promises to be something new in the history of magazine literature.

HARPER'S opens with a poem of great length by RICHARD H. DANA, called "The Buccaneer," with nine illustrations; an illustrated article on the "Danube," one on the "New York Harbor Police," and one on "NATHANIEL HAWTHORNE." All of these articles are well worth reading, and stuffed with excellent illustrations.

THE ECLECTIC, that old favorite, has a good portrait of MAZZINI, with a sketch, another view of Lord Byron, and a very interesting lecture on the revival of learning in the Middle Ages, together with other articles of value.

THE SCIENCE OF HEALTH, by S. R. WELLS of New York, is one of our best family, hygienic publications, and has many articles of value as well as interest. The more people know of health matters the better.

THE PHRENOLOGICAL JOURNAL has portraits of Dr. LOWELL MASON and the famous Japanese in America, ARINORI MORI and KOZO SOOGIWOORA, with many other illustrations, and good articles.

APPLETON'S JOURNAL always has beautiful pictures and spirited romances, as well as fine sketches of a miscellaneous character. It is one of the best literary weeklies published.

THE HOME GUARDIAN is the organ of the Boston New England Moral Reform Society. It is a handsome monthly, filled with unexceptionable articles, adapted for ladies.

THE LAWS OF LIFE, Dansville, N. Y., a very excellent health journal, has an essay on "Horseback Riding for Girls," worthy of attention.

TO DAIRYMEN AND CAPITALISTS.

1,000 Acre Dairy Farm for Sale, with Stock, Implements, &c.

PRICE..... $40,000.

The subscriber offers for sale SPRINGWATER FARM, consisting of 1,000 acres, situated on Scugog Island, Ontario Co., Canada, and distant three miles from Port Perry, the terminus of the Whitby & Port Perry Railway, and close to the waters of Lake Scugog, where there is an abundance of fish and game.

This farm is specially adapted for dairy purposes, being watered with numerous springs, all the buildings being supplied with water from this source, conducted through pipes, as well as cattle yards, &c. There are on the place twelve houses for workmen, five large barns, horse and cattle stables, sheds, pens, &c., and one large dairy building, through which a stream of water constantly runs. The soil is first-class, never failing to produce heavy crops. There is a reserve of wood land in connection with it, sufficient to meet the requirements of the place. The farm would be sold in one, or two blocks of 500 acres each, the purchaser having the option to take cattle, stock, horses and implements at a fair valuation, made by disinterested parties.

TERMS OF SALE.—For the Land—$10,000 down, balance on mortgage for from 5 to 10 years, with interest at 7 per cent. per annum. For Stock, Implements, &c.—$5,000 down, balance in one year, without interest. Parties desiring to see the place, or to purchase, will please address **WM. S. SEXTON,**
Port Perry P. O., Ontario, Canada.

Fashions for Fall and Winter.

1170

GODIVA. This Polonaise is one of our latest Paris Novelties. It contains many new and very valuable features. Without looping it can be worn as a long light-fitting basquine, or looped (as shown in cut) it is a most elegant Polonaise. The ornamental back piece passes over the shoulders and forms a neat bust cape in front and is "adjustable;" may be worn or not as fancy dictates, thus constituting *two* entirely different Polonaise in appearance. The back piece is sometimes made in velvet or satin, and richly trimmed, and completes a brilliant toilet when worn with a house dress. Besides its beautiful variations it is well adapted to any material. Takes six yards of 24 inch goods. Price of pattern with cloth model ONE DOLLAR. See PREMIUM OFFER below.

1165

NEW FALL WRAP, is a sacque and cape, with a terrible box-pleat laid on the under side in the back, and in place of the broad pleat of last season; just the three edges are visible from each side, giving the appearance of six round folds, the cape slopes gracefully to the back, and is left open to trim. The sacque has a large sleeve, which can be used or not, as weather or comfort demand.

We give this as one of the very best for fall and winter cloak made in either velvet or cloth. The original is of dark blue ladies' cloth. Scolloped and bound with velvet and velvet buttons. Takes three yards of ladies' cloth. Pattern, with cloth model, 50 cents. *See premium offer below.*

762

PRESTO. Chemise for lady. Its great success in leading all other styles is owing to its perfect fitting hand and sleeve. The curved arm-size is an improvement of *much* value, as it will not *cut* the shoulder or *bind* the arm, and also avoids the homely, perplexing gusset. Takes three yards linen for medium-size. Pattern, with cloth model, 25 cents. See Premium below.

We give a CLOTH MODEL with each pattern which SHOWS every seam, pleat, gather, loop, etc., how to put the garment together by the pattern, and how it will look when completed. By the use of our Cloth Models any person who can sew can FINISH the most difficult garment as easily as the plainest. They are PERFECT GUIDES.

Premium Offer!

NEW YORK FARMERS' CLUB.

Hungarian Grass.

R. T. WOOLMAN, Salem Co., N. J., sowed Hungarian millet the 20th of July, and in one month it was out in head and has been growing thicker ever since, new heads constantly coming up. He asks the right time to cut it for hay. He was advised to cut it when in bloom, which the RURAL NEW-YORKER pronounces a correct answer. For hay, if cut when in bloom, before the seed develops, it is a most profitable forage crop.

Apples Grafted on White Oak, etc.

A week or two since it was stated that a gentleman—Mr. CHAS. FAIRCHILD—at Westport, Conn., had succeeded in grafting apples on White Oak, Birch, Buttonwood and Black Alder, and producing fruit thereon. DUDLEY P. ELY, Mayor of Norwalk, Conn., was requested, by the Chairman of the Club, to visit Mr. FAIRCHILD and ascertain the truth. He writes the Club:

Yesterday I went to Westport, Conn., and saw Mr. FAIRCHILD and his apple trees, that have caused some interest in your Club. Mr. FAIRCHILD is an old and very highly respected resident of Westport, and his statement I have no doubt is strictly true. He showed me in his orchard four apple trees, all grafted, he said, by himself some twenty years ago, one each in White Oak, Birch, Button Ball, and Black Alder—all grafted in the root. These trees, to all appearance, were ordinary apple trees, six to eight inches through the body. The fruit on these trees had all been gathered, except that on the Black Alder. Some apples from this tree I picked and now send them to you for examination by your Club if they desire to. Mr. FAIRCHILD did not know the proper name of these apples, and I would suggest they be called the Apple of Discord. I thought there might be a possibility the grafts themselves had taken root, but FAIRCHILD was confident they had not.

Mr. ELY's theory that the grafts themselves had possibly taken root, is doubtless correct.

Worms on Evergreens.

A. T. BLAUVELT, Rockland Co., N. Y., writes: "I keep a nursery about twenty-five miles north of your city, and have been troubled this Fall with a small green worm about one inch long, which makes great destruction among my evergreens, mostly the pines, commencing generally at the top and eating the leaves or spines entirely off, leaving the tree completely naked; and thus they go through my rows stripping everything. I have never seen anything of the kind before, and do not know what to do: have been shaking them off and killing them, but they seem to come the faster." If Mr. BLAUVELT will send some of the worms, alive, to the RURAL NEW-YORKER Office, he may possibly learn more about them. We hope he will do so.

Touzelle Wheat.

W. W. ALEXANDER, Culpepper, Va., says of this wheat, which we have seen repeatedly commended:—"I have tested it three years with complete success each year. The last season it yielded fifty bushels to the acre, weighing sixty-six pounds to the bushel. It is remarkable for its hardiness and earliness. I sowed it September 27, 1870, and it ripened June 1, 1871, full ten days sooner than Lancaster." Who among our readers have grown it this year? What can they say about it? It was sent out by the Department of Agriculture a year or two ago.

Apple Pomace as Manure.

A correspondent having asked if apple pomace from a cider-mill, thrown in a manure heap, would lessen or increase the value of the manure, was answered by Mr. H. E. COLTON, a chemist, as follows:—Apples usually contain about 82 per cent. of water and 1½ per cent. of acids. In making cider it is generally the above and a small proportion of grape sugar which is extracted by the pressing. There would be left fiber, starch, and gelatine, amounting to about 10 per cent. This contains matter capable of providing nitrogen, and if composted with ground plaster could be made of some value. Muck will also be a valuable addition to the pile. The pomace would not be worth a great deal to purchase, but as a waste article it would pay to save it in this way. If dried very quickly or if taken immediately from the press, a very good jelly may be made from the pomace, with less sugar than from the original apple. The principle upon which Alden's jelly is based is that the starch of the cores and skins is converted into grape sugar by his process of dehydrating.

Packing Apples.

A correspondent inquired if he should pick his apples, put them in barrels and head them up at once. He was advised to pick them and put them carefully in barrels, leaving the latter open a few days until the fruit ceased "sweating," then head them up and keep (if intended for Winter use) in as cool a place as possible without allowing them to freeze.

Kansas Fruit and Fruit Growers.

Dr. J. STAYMAN, Col. J. C. VINCENT and Dr. WM. M. HOWSLEY, a Committee of the Kansas Horticultural Society, are in town exhibiting Kansas fruit at the American Institute Fair. They were present at the Club's meeting, and Dr. STAYMAN spoke of the fruit producing resources of Kansas in the highest terms, having, to back his statements, fruit actually produced in that new State. There is no doubt about the resources of Kansas; so little doubt is there that to outsiders who are not interested in Kansas lands, or those of any other State, this eternal advertising of Western lands has become an insufferable nuisance.

RURAL NOTES AND QUERIES.

Poultry at the State Fair.—We beg leave to inform you that the show of poultry at the *State Fair was not poor*. Perhaps you will not *gain anything* by trying to run the *State Fair out*. Yours, BORDWELL BROTHERS.

THE *italics* in the above note are as underscored in the letter. We have to say in response:

1. That our information was obtained from two or three disinterested gentlemen—men in no wise interested in depreciating any feature of the Fair, and having no connection with, or relation to, breeders of fowls. They spoke of the exhibition as a whole and (so did we) with no attempt or disposition to depreciate individual exhibitions, or with any pretence that there were not good fowls there.

2. We are not trying to "run the State Fair out." We simply purpose to tell the truth concerning it, so far as we may be able to glean or know it. We never did gain anything by suppressing the truth, nor do we ever expect to do so; nor have we ever intended to suppress it, however grateful some people would be if we did—especially some of the members of the State Agricultural Society. We owe the Society nothing except commendation when it is apparent that it is laboring for the highest interests of the Agriculturists of the State; and we are more than ready to honor any draft made upon our columns when such is the case. We do not even owe it ill will; for we have no personal ambition to gratify nor any personal wrongs to revenge in our relations to it.

3. Confirming rather than condemning our statement as to the character of the Poultry Exhibition at the N. Y. State Fair, we copy the following from the Country Gentleman of October 10:

The entries for poultry were very numerous, but the exhibition was conspicuous by the absence of many entries, some of the parties seeming to choose this as an honorable way for free advertising. * * * The accommodations for poultry were superior, and while the show was very creditable, it is a matter for serious regret that so many stalls were vacant, when the purchasers of catalogues would naturally expect a larger exhibition.

The American Rural Home, Oct. 12, says: "We are not prepared to say that the show of poultry was equal to that at the Western New York Fair, taken as a whole."

We know there were good birds there, by exhibitors of reputation; but we have only the testimony of the above firm to prove that for a State Fair the exhibition of poultry was not poor. We have no evidence that it was good, except that of the Country Gentleman that it was "very creditable," which may mean little or much, as one chooses to interpret it in connection with its other language.

Literary Men as Agricultural Speech-Makers.—We have repeatedly protested against the practice of Agricultural Fair managers who seek some literary notable to address farmers at Fairs. It is all well enough if Fairs are to be only social re-unions, whereat agriculture is to be tabooed; but if Fairs are for profit, and the meeting of farmers there is to both gain and give information relative to their vocation, then there ought to be some reform in the matter of selecting speakers. No society ought to go outside its own membership for such purpose. This is suggested by a remark made by a correspondent of the N. E. Farmer, writing of the Franklin Co., Vt., Fair, who says:—"C. C. COFFIN of Boston delivered the annual address. As is usually the case, it was a very pleasant thing to hear, but the average farmer did not get an idea from it worth carrying home." And yet Mr. COFFIN, in his place and vocation, is an able man.

Farmer Garrulous' Relative in Michigan.—Referring to Farmer GARRULOUS' talk about his strawberry and cherry friends in RURAL NEW-YORKER of July 6, R. H. R. writes:—"Farmer GARRULOUS has a brother or half brother, or a 17th or 18th cousin away down here in Michigan, who don't raise strawberries and cherries, but who has some 730 pails, and makes maple sirup and sugar in Spring. He has one of COOK'S evaporators, evaporates the sap, it passing in at one end and out at the other end sirup. Mrs. STICKUPHERNOSE often visits him there; not only she, but the Misses STICKS and all the young STICK, STACK, STUCKS pour in in multitudes, all anxious to learn the whole art of evaporating the sap and tasting and testing the sirup."

Doubtless.

Sprees for Agriculturists.—A correspondent of the RURAL NEW-YORKER suggests that the name Agricultural Fairs be changed to "Agricultural Sprees," and that all attempts on the part of farmers and gardeners to exhibit their products thereat, be discontinued, since Fairs are little more than days of recreation and amusement—and no amusement whatever to exhibitors, who, at large expense and at the cost of much discomfort, take their products to these Fairs for exhibition. We fully sympathize with our friend, The *spirit* which once begat Agricultural Fairs has departed, and we doubt if it ever returns. Time and the tastes and the progress (?) of the people have modified most of their features.

The Horse Disease in Toronto.—In New York, a year or two ago, a disease appeared among the horses of the omnibus and city railway companies, which carried off scores of valuable animals. A telegram from Toronto, Ont., announces that this disease is prevailing to such an extent in that city that the street railway companies are unable to run more than half the usual number of cars, that merchants are unable to get their goods carted to and from the depots, and that carriages can with difficulty be hired at any price. Don't we need, and will we not soon have steam on the city railways, and steam wagons for hauling goods? It seems to us feasible and probable.

Importation of Steam Plows Duty Free.—An Illinois correspondent asks if steam plows can be imported from England, duty free. He has heard it so stated, but has seen no intimation of the fact in the Agricultural papers. In response to his inquiry we may say that in the new tariff act, approved July 6, 1872, section 7, it is provided "that for the term of two years from and after the passage of this act, and no longer, steam plow machinery, adapted to the cultivation of the soil, may be imported by any person for his own use free of duty, subject to such regulations of the Secretary of the Treasury as before provided."

Farmers' Wives' Clubs.—Is this a new name for the old-fashioned, scandalous Tea-table Talks? Or is it really one of the modern improvements in Rural housewifery; for we do hear of organizations with the above title, which meet of afternoons, pretend to discuss household affairs and domestic economy generally, and permit the husbands to come for them in the evening. Can any of our readers inform us whether a real, *bona fide* Farmers' Wives' Club, for practical purposes, is in operation? If so, please tell us all about it.

Gen. Horace Capron in Japan.—On the authority of the Japan Minister, MORI, at Washington, the statement is made that the last accounts received from the Japanese Government, indicate satisfaction with the work Gen. CAPRON and his *confreres* are doing in that country. This sets at rest the story (long ago denied in these columns) started by a Western paper, that the entire American Agricultural Commission had been discharged by the Japanese Government, and the members thereof were on their way home.

Personal.—In its Personal and General Notes concerning the great Exposition in that city, the Louisville Courier-Journal says:—"Colonel S. D. HARRIS, Corresponding Editor of the RURAL NEW-YORKER, is one of the most industrious members of the press who have visited the Exposition. He has improved the time by writing full letters for his and other papers. After leaving us he will take a Southern jaunt, which we trust will prove pleasant and profitable."

Pears from Ellwanger & Barry.—The RURAL NEW-YORKER acknowledges, with thanks, the receipt of packages of pears—excellently grown and of good varieties—from ELLWANGER & BARRY, Nurserymen, Rochester, N. Y. These gentlemen know how to grow pear trees that will produce pears; and they know how pears should be produced; and they do both and then remember their friends.

RURAL BREVITIES.

THE RURAL NEW-YORKER is always glad of practical correspondence. This answers R. P. B's inquiry.

NO! JOHN P. S. is informed that our political preferences are not to be expressed in our columns, nor those of any other man.

IF M. HALL had read the RURAL NEW-YORKER (which he has taken twenty years) he would have learned how to grow mushrooms. Let him look on page 375, RURAL, June 8, 1872, for information.

THE Watertown Reformer asks us to prove that it steals. In a recent number of that paper (don't remember date) appeared as an original contribution to it an article entitled "Starting in Married Life," first published in, and contributed to, the RURAL NEW-YORKER. How did it get it if it did not steal it?

THE SEASON, CROPS, PRICES, ETC.

Rising Sun, Ohio Co., Ind., Oct. 7.—The season has been a favorable one so far. We are now having good weather for sowing wheat, digging potatoes, and drying up the corn. The corn crop is good; potatoes good; hay injured by wet weather; wheat crop light; oats good; fruit crop short. Corn is 43c.; wheat, $1.40@1.50; potatoes, 45c.; hay $14@16 per ton. Some more sickness than common. I would like to hear from my brother farmers in Michigan as to crops, prices, etc.—F. H.

Princess Anne Co., Va., Oct. 1.—We have had a very dry Summer, even up to this date. The heat in the shade as high as 94°. Corn is the chief crop, but we can raise anything else to perfection, and supply the millions with "truck." Lands are cheap—from $3 to $10 per acre for farms. Cattle are fed two or three months, and do well in the woods during the remainder of the year. We do not have it very cold in Winter. Last Winter it was down to 10°, which was very cold for this latitude.—J. E. B.

South Trenton, Oneida Co., N. Y., Oct. 1. Meteorological observations for the month of September:—Thermometrical averages:—The highest point of temperature attained, the 7th, 9°; the lowest, on the 21st, 34°. Average temperature for the month, 55° and 13'; average at 7 A. M., 54°; at 2 P. M., 67° and 5'; at 9 P. M., 54° and 12'. Rain fell on 12 days; 2½ inches of water fallen. Seven days of thunder; nine days of lightning. A slight frost on the 21st; no damage to vegetation. The 26th and 27th a rapid change in the barometer denoted a gathering storm; the 28th it came with furious winds accompanied with rain.—STORRS BARROWS.

Lyndonville, Vt., Oct. 10.—Weather warm, with frequent showers. On the evening of Oct. 7 quite a heavy shower with thunder. The soil is thoroughly saturated with water in this section of the State. The past season will be long remembered for its heavy rains and succession of freshets, doing more or less damage to growing crops of grass and grain. The hay crop was quite heavy, but not secured in the best condition. Grains very good. Potatoes light—badly affected by rot. Fall feed excellent, and pastures at the present as green as they usually are in June. No frost as yet to kill the tenderest vegetation—something unusual in this latitude in Vermont. Flowers hardy, half hardy and tender, in full bloom out of doors.—I. W. S.

"EXCELSIOR!"

MOORE'S RURAL NEW-YORKER.

THE BEST WEEKLY!
LARGEST CIRCULATION!
MOST LIBERAL PREMIUMS!

TO AGENTS AND SUBSCRIBERS!

THE RURAL NEW-YORKER gives every one who subscribes for Fifteen Months from Oct. 1, a *Five Dollar Picture Gratis*—and allows its Club Agents to count such (15 month) subscriptions in making up their lists for the Liberal Premiums it offers for 1873!

Biographical.

WILLIAM H. SEWARD.

THIS great American statesman and diplomat died at his residence in Auburn, N. Y., on the afternoon of Oct. 11th, from a catarrhal effusion into the lungs, from which he had suffered some days. His intellect was vigorous to the last and his last hours were tranquil. He spent them in affectionate leave-takings. Mr. SEWARD was a great American citizen, whose name is woven with the later history of his country, who was more widely known than most great men—loved at home and respected all over the world. He was of Welsh and Irish descent, born in Florida, Orange Co., May 16, 1801. He entered Union College at 15, graduating in 1820 with honors. He studied law in New York City and was admitted to the bar in 1822. He settled in Auburn, marrying a Miss MILLER in 1824. In early life he became a politician, taking an anti-slavery stand. In 1830 he was sent to the State Senate as an Anti-Mason, where he distinguished himself as a promoter of wise laws and needed reforms. Mr. SEWARD was made Governor of New York in 1838 at the age of 37. His administration was wise and devoted to reform. Re-elected in 1840, at the end of his term he returned to the practice of law. In 1849 he was elected to the U. S. Senate in place of Gen. DIX. He became the peer of WEBSTER, CLAY, EVERETT and the great men of that day. His speeches on the "Higher Law" and the "Irrepressible Conflict" have become historically famous. Many times Mr. SEWARD was spoken of as a Presidential candidate, and at one convention received 173 votes. As a Senator he always fought slavery, gaining great distinction for so doing. In 1861 President LINCOLN gave Mr. SEWARD the first place in his cabinet. The civil war followed. We do not need to speak of the course of the great Secretary of State during that momentous period. He brought renown to his country and won the admiration of the world. At the time of Mr. LINCOLN'S assassination he barely escaped with his life. He remained in Mr. JOHNSON'S cabinet, leaving public life at the close of that administration. In 1869-'70 he made a tour round the world, being everywhere received with distinguished honors. Since his return to Auburn, Mr. SEWARD has been engaged upon two books, one an account of his travels and the other a history of his life and times. The first he left finished and it will soon be published; the second was about half finished. Mr. SEWARD died in his study, amid his books and papers. He will be universally mourned in the United States and regretted in all Christendom.

FANNY FERN.

ON the same day that Mr. SEWARD died "FANNY FERN," the wife of JAMES PARTON, departed this life. She had been unwell all Summer, yet her death was unexpected to the public. Her maiden name was SARA PAYSON WILLIS, and she was a sister of N. P. WILLIS, the poet. She was born in Portland, Me., in 1811, and educated at Hartford, Conn., by Miss CATHERINE BEECHER. Her first husband was a Mr. ELDRIDGE, by whom she had three children. Left a widow in embarrassed circumstances, she commenced writing for the press in 1851, over the name of FANNY FERN. Her book of "Fern Leaves" sold to the extent of 75,000 copies. The only novels she published were "Ruth Hall" and "Rose Clarke." In 1856 she married JAMES PARTON. Since that day she has been known as a writer of short sketches in the New York Ledger. She had a stormy life, but its closing years were unclouded.

EMPEROR WILLIAM.

KATE FIELD furnishes a Paris paper the following pleasant gossip about Kaiser WILLIAM: "I don't know whether it be the effect of victory, but certainly I never saw such a satisfied looking people as these Germans. Their complacency is absolutely exasperating, and I do not wonder that sanguine Frenchmen are driven almost wild by the sight of a Prussian helmet. A settled "rock of ages" expression about their faces here expresses eternity rather than time, and to associate death with such imperturbable life seems almost impossible. As to the Emperor, he carries out the idea of everlasting life by being as active at seventy-five as most men are at fifty-five. He is sun, moon and stars to every German man, woman and child at Ems.

I gave great offence to one woman by saying he looked very much like other men, which is true (a Scotchman here resembling him so closely as to be called 'the Emperor'), and excited indignation in the breast of a patriot by inquiring about the Imperial income, and expressing surprise at his ignorance of the amount. 'It makes no difference what the Kaiser's income is,' replied the irate Prussian, resenting the innocent question as though I had accused the royal family of highway robbery, 'a few millions, more or less, and what odds?'

"No one accuses WILLIAM of possessing great ability, but surely the man who discovered BISMARCK and who follows his suggestions must appreciate ability in others. That his mind is eminently practical shows itself constantly, and that he dislikes ostentation is proved by his life at Ems. Dressed quietly in a suit of 'pepper-and-salt,' he appears among the people accompanied by a member of the court; drinks his water at the spring like everybody else, shakes hands with his friends, bows to everybody and discourages ceremony of all kinds.

WILLIAM H. SEWARD.

"When the Kaiser first went to Ems he sent for all the physicians, receiving them most cordially, and sitting on the end of the table during the entire interview. Upon taking leave of them he said:—'Remember, gentlemen, that when you meet me you are not to know me, for I am a poor man and cannot afford to buy many hats.' This was a polite way for telling the gentlemen that it was a great bore for him to return salutations and that he had rather not be recognized. No physician of Ems will be found removing his hat at the approach of the Emperor.

"His reference to poverty is not unfrequent. Upon the birth of one of the Crown Prince's children, a courtier with whom he chanced to be walking drew the Imperial attention to a trinket, remarking that it would be a suitable present for the happy mother. 'Ah no,' replied the cautious WILHELM, 'that would be a bad precedent, for if my daughter goes on adding to her family as she has begun, I should eventually be ruined. I am too poor for such extravagance.'

"Not long ago he received a beautiful gold and silver escritoire, as a token of gratitude from a wealthy banker whom he had ennobled for largely endowing a hospital. Gazing at the superb gift WILHELM remarked: 'My subjects are better off than I am. I cannot afford to make my friends such costly presents!' Whether the KAISER is frugal into closeness, I do not know, but that he does not believe himself hedged in by divinity is certain. 'I dined with His Majesty yesterday,' said a German, whose position is not higher than that of a hotel treasurer. 'He is very frank and friendly.' Fancy Queen VICTORIA doing anything of the kind, SALLY! Why, she lectures the Prince and Princess of Wales on their want of exclusiveness, and tells them if they are not more careful they will be 'as common as the Cambridges.' The Cambridges you know, are her cousins.

"The KAISER frequently gives dinners to the officers stationed near, or visiting here, and in fact any person in the Government employ, either civil or military, is eligible to this distinction, which is considered ample compensation for exceedingly meager salaries. How these people can afford to live is a mystery. The KAISER is very like his photograph, only he is not as good looking as represented. Erect and soldierly in his carriage, portly, but not obese in figure, he resembles an English country gentleman, or a solid, shrewd man of Boston. What his chin lacks in force his head makes up in obstinacy, while there is an extreme thickness of neck and breadth of cerebellum that indicate unusual fighting proclivities and a bulldog tenacity. I should say that it would be difficult to pound a new idea into his head or an old one out."

THE late Mr. SEWARD, Judge STORY, FISHER AMES, R. C. WINTHROP, and many other noted men, entered public life at an early age. Age and wisdom are, therefore, not always synonymous.

FANNY FERN.

MEN PERSONALS.

TILTON talks thus of Dr. HENRY W. BELLOWS, which is about as much of a "personal" as one man need have thrust on him in a lifetime: "It has seemed to us that a greater heretic than PARKER, and a better ecclesiastic than CARDINAL RICHELIEU, a devoted ascetic and a genial man-of-the-world, a capital Congressman and a first-rate college President, something of a philosopher and a good deal of an orator, were somehow combined in one constitution and christened HENRY W. BELLOWS; but the union not being quite perfect, sometimes one character and sometimes another obtains the ascendancy and speaks for all the rest. He is a Cosmopolitan Society in one person, and we never hear him speak without wishing he would never do anything else, nor read him without regretting that he does not write all the time, nor talk with him without wishing that he would give himself up to society, nor listen to his criticism of paintings and statuary without deploring the loss of so much genius to art, nor enjoy his representations of his favorite actors without trying to calculate whether the loss to the stage of such a performer as he would have been is compensated by the gain to the pulpit of such a preacher as he unquestionably is. People call him inconsistent because they fail to see that he is a whole Club in one person, and refuse to think he is a great man because he is so many."

COUNT MONTALEMBERT is thus described by Mrs. OLIPHANT:—His eyes were always clear as a boy's, blue and keen, but kind; and his forehead high and open. He had the fresh complexion of an Englishman, along with the more clearly defined and finely-cut features proper to his nation—and his countenance was benign and serene, yet with certain lines of incipient sarcasm about the subtle mouth. The charm of his manners was very great, and yet it was no excess of gentleness which made them fascinating. The most gracious and graceful courtesy, springing from the natural impulses of a heart full of kindness, was yet not sufficient to veil anything that was absurd or foolish from the quick and humorous perception of his keen eyes. His observation was so rapid and the operation of his mind so instantaneous that he had often caught an absurdity in conversation before the speech that contained it was completed, and had launched his brilliant shaft of ridicule, filling the room with laughter, and the culprit with bewildered confusion, before the words which had called forth his wit were well said.

DR. JOHN BROWN, the great lover of dogs, author of "Rab and his Friends," "Spare Hours," and "Maid Marjorie," lives at No. 23 Rutland street, Edinburgh, where he still practices his profession. He says he shall never see America in the body, but he may float over here afterwards, if it is permitted. The walls of the rooms of his house are hung with pictures, the same as Mr. BEECHER adorns his house with, in Brooklyn. In one corner of his drawing room, by a window, is a well-worn writing desk, above which hangs an etching of a dog's head, under which is written, on the margin:—"Not in the least worthy of the great Rob; but, yours truly, LANDSEER." Dr. BROWN commenced the story of Rob at eleven o'clock one evening, and it was finished at four.

IN his excellent work on "How to Educate Yourself," GEO. CARY EGGLESTON says that the present Editor of the Atlantic Monthly, W. D. HOWELLS, a scholar, a poet, an author and a critic, with certainly very few if any superiors in America, left school to learn a trade at ten, and has never had a master since. He also says: "Dr. FRANKLIN was a wise man and an able one, and Mr. GREELEY has achieved a great success in his profession. ELIHU BURRITT learned a good deal about languages while at the forge, and ROBERT COLLYER has not forgotten how to make a horse-shoe while he has been learning how to preach an eloquent sermon." All these men, he thinks, would have been earlier successful if they had had in early life the advantages of a regular training.

LEWIS NOE, the Long Islander, whose *expose* of HENRY STANLEY'S antecedents prior to his trip in search of Dr. LIVINGSTONE, has not only made for himself much notoriety but helped to confirm the doubts of those who have heretofore doubted that STANLEY has seen LIVINGSTONE, is described as a sallow, sunken-cheeked, gypsyish-looking man, whose skin is very dark, moustache and imperial very black, thin and snakey, nose aquiline, eyes have a peculiar earthy expression action nervous, suspicious and almost fearful. He is said to be hypochondriacal and full of alarms.

M. THIERS, President of the French Republic, it is a satisfaction to know, dresses ordinarily in black broadcloth—a frock coat, decidedly ancient pants, "a New England high shirt collar" (whatever that may be), and invariably carries an umbrella or cane on which he leans when he walks. Now let us see if "New England high shirt collars" are not more affected by people who think they should become Presidents of republics.

MR. BEECHER has honestly earned twenty-five cents. While at the Twin Mountain House a young sprig rode up and asked Mr. BEECHER to take his horses to the stable; which he did in the best style. The story was too good to keep, and the young sprig started in search of quarters in a hotel which had a less famous hostler. We have not heard what Mr. BEECHER intends to do with his money.

AUTUMN.

BY ROSETTE A. ROSE.

THE Summer, with its golden crown
Of beauty, rich, and bright, and rare,
Has passed away, and left behind
A charm that it could never wear;
A charm that fills our wondering souls
With some mysterious, dreamy spell,
That seems to mingle earth with heaven,
And bring us near where angels dwell.

O! that the muses would be kind,
And give me power to express
The glory of the Autumn-time,
And all its tender loveliness;
The azure haze that veils the sky,
And wanders through the golden air,
Seems like a dream from Heaven sent
To win our wandering spirits there.

O! may the future of my days
Bring me an Autumn as divine,
When through the mist of age's cares
The golden light of Heaven shall shine;
When, looking back on deeds well done,
And looking up for bliss to come,
I'll dream away the Autumn days
Until my Master calls me home.

Our Story-Teller.

HOW MARION WON.

"OF all the things this is the worst! If I ever in all my life expected to hear such news! Why, our George has gone and got married! Do you hear?"

Good Mrs. Clements pushed her steel-bowed spectacles off her bright eyes, and dropped her letter in her lap, as she turned round to her husband, the stout, clever old farmer, who was contentedly stroking the old white cat.

"Deacon, d'ye hear?"

This time, when she asked the question, there was a touch of sharpness in her voice.

"Yes; what if he is married? I'm sure it's natural enough. It kind o' runs in the family, 'pears to me."

But Mrs. Clements would take no notice of the little pleasantry.

"Well, if you like it, I can tell you I don't. He needn't think he's coming here, with his fine city-bred lady, all airs and graces, and flounces and ruffles. There's plenty of good girls hereabout that wanted him. Right in the middle of work, too! to talk of bringing a lady here in hog-killin' time! I do declare I think George is a fool.

* * * * * * * * *

A graceful, dainty little lady, in a garnet poplin and ruffled apron, with a small, proudly-poised head, covered with short, dusky curls, and a pair of dark blue eyes, so wistful and tender, a tiny rosebud of a mouth, and a dimple in one pink cheek.

That was Mrs. Marion Clements. Was it any wonder that George had fallen in love with her?

She sat in the bright little parlor, close beside the lace-curtained window, watching for the loved husband's return; and then, when she heard the click of the latch-key in the hall, flew for the welcome kiss.

"Haven't you got the letter this time, George! I've felt sure of it all day. Indeed, I've quite decided what dresses to take with me."

He smiled and shook his head.

A cloud passed over her pretty face.

"O, George, isn't it too bad? And I do believe—oh! I do believe they won't write because they are sorry you married me."

He put his arm around her neck.

"And supposing such be the case, do you think it would make any difference to me?"

"Oh! no! no! only it would grieve me so if I had alienated your parents from you."

"And a one-sided alienation it would be too! They have never seen you! And when they know you they can't help loving you."

"O, George!"

And the exclamation was caused by the kiss accompanying his loving flattery.

"That's true as preaching. By-the-by, my dear, what would you say if the firm sent me off on a traveling tour of six weeks?"

A little dismayed cry answered him.

"You won't stay here alone, eh? But, Marion, it would be five hundred dollars clear gain to us."

"What need we care for money? I'd rather have you."

A mischievous smile played on the young man's lips; he was more matter-of-fact than this romantic, tender little wife of his.

"I think the addition to our balance at the banker's would be very consoling for the absence. But never mind, little pet. Let's go down to dinner. I hope we'll get a letter from home soon."

And soon it was; for Marion snatched it from his coat-pocket the very next night. But her husband's face looked very grave and stern, and his eyes looked angry when she looked gleefully over the envelope.

"My dear, you must remember I care very little for what the letter contains. Remember, I did not write it; that you are dearer to me than ever before. Kiss me, first, while I watch you."

A little pang of misdoubt troubled her when she glanced over the note; then tears stole from under her lashes, and George saw her mouth quiver and tremble; then, when she had finished it, she laid her head on his shoulder and cried.

"It was cruel to let you see it, my wounded birdie. Let me burn it. And don't forget, darling, what the Bible says, that a man shall leave father and mother and cleave to his wife. You are my precious wife, Marion, and to you I turn for all the happiness my life will ever hold."

He dried her tears, and then they talked it over.

"Just because I am city-bred, she thinks I am lazy, and haughty, and dainty, and——"

"Never mind, Marion. She will find out some day. My father——"

"Yes, bless the dear old man! He has added: 'My love to my daughter Marion.' Oh, I know I should love him, and your mother, too, if she would let me."

"We will invite them down, when I come home. By the way, Marion, I will stop at the farm on my way home, and invite them down, and bring them home with me."

"George, dear, I have been thinking about that trip West. I think you had better go, and leave me at home. It won't be so very long."

Marion was eating her egg while she spoke across the cozy little tete-a-tete breakfast table.

"Spoken like my true little Marion, and when I come back I'll bring you a present. What shall it be?"

"Your mother and father from the farm. It shall be that hope that will bear me company when you are gone."

A fortnight after that Marion Clements ate her breakfast alone, the traces of a tear or so on her pink cheek; then she dashed them away with a merry, joyous little laugh.

"This will never do, and now that George has gone for six weeks, to prepare for his return. And I pray heaven it shall be such a coming as shall delight his very soul."

* * * * * * * * *

"I'm sure I don't know what to say. The land knows I need help bad enough, but 'pears to me such a slender little midget as you couldn't earn your salt. What did you say your name was?"

"Mary Smith. And indeed if you will try me for a week, I am sure you'll keep me till the season's over."

Mrs. Clements looked out of the window at the great clouds that were piling gloomily up; and then the wind gave a great wailing shriek around the corners of the house.

"You can cook, can you? or shake up feather beds—good big ones, forty pounders."

A gleeful little laugh came from Mary's lips.

"Indeed I can. I may not cook to suit you, but I can learn."

Mrs. Clements walked out to the huge open fireplace in the kitchen where the deacon was shelling corn.

"What d'ye say, deacon; keep her or not? I kind o' like her looks, and the dear knows it 'nd be a good lift while we're killin', if she couldn't do more'n set the table or make mush for the bread."

"Take her of course, Hannah. You are hard driv' I know. Let her stop a week or so anyhow."

So Mrs. Clements came slowly back and sat down again.

"You can't get away to-night, anyhow; there's a snow-storm been brewin' these three days, and it is on us now, sure enough. See them 'ere flakes, fine and thick. You may as well take your things up stairs to the west garret, and then come down and help me get supper."

Then followed directions to the west garret; and when she was gone, Mrs. Clements turned to the deacon:—"I never saw a girl before I'd trust up stairs alone. But such as her don't steal; I can tell you that if nothing else."

Directly she came down in a purple print dress and white apron; her hair brushed off from her face into a net; a narrow linen collar, fastened with a sailor's loop of narrow black ribbon. It seemed as if she had life, too, so handily she flitted in and out of the big pantry and then down the cellar. Then after the meal, she gathered the dishes in a neat, silent way, that was perfect bliss to Mrs. Clement's ear.

"She's determined to earn her bread anyhow; and I like her turn too."

And the deacon had "taken a shine" to Mary Smith. One by one the days wore on; the hog killing was over and done; long strings of sausages hung in fantastic rings, arranged by Mary's deft fingers; sweet hams and shoulders were piled away in true housewifely manner, and now Mary and Mrs. Clements were sitting in the sunny dinning-room, darning, patching and mending.

"I don't know what I am going to do without you, Mary; I dread to see you pack up your clothes."

A blush of pleasure overspread Mary's face.

"I am so glad you have been suited with my work. Indeed, I have tried."

"It ain't the work altogether, though goodness knows, you're the smartest gal I've seen this many a day. As I say, it ain't the work—it's you, Mary. I've got to thinking a heap of you—me and the deacon."

Mary's voice trembled at the kindness of the old lady's tone, but she sewed rapidly on.

"It is so uncommon lonesome since the boy left the farm; but it's worse since he got married. It seems like deserting us altogether."

"Have you a son? You never mentioned him."

"No; George has gone his way, and we must go ours. Yes—he married one of those crack-headed boarding-school people, who can't tell the difference between a rolling-pin and a milk-pan."

But despite her scorn, Mrs. Clements dashed off the tears with her brown fist.

"Is his wife pretty? I suppose you love her dearly."

"I don't know anything about her, and never want to know. He's left us for her, and us old folks will leave him for her too. Mary, just turn them cakes around; seems as if they're burning."

When Mary had turned the cakes Mrs. Clements was leaning on the arm of her chair.

"Mary, supposin' you stop on with us another month yet, anyhow. Then deacon will make it all right."

"It isn't the money I care for, Mrs. Clements; I only wish I might stay always. You don't know how much I love you."

"Love us! do you? Bless your heart. If poor George had only picked you out, what a comfort it would be to us all! But it can't be helped now."

She sighed wearily, then glanced out of the window, looked a moment, and then threw down her work.

"Bless my soul, if there ain't our son George coming up the lane! Deacon! deacon! George is coming!"

And all her mother-love rushing to her heart, she hurried out to meet him. Oh, the welcoming, the reproaches, the caresses, the determination to love him still, despite poor innocent little Marion! Then when the table had been set in the next room by Mary's deft fingers, and she had returned to her "west garret," Mrs. Clements opened her heart.

"There's no use talkin', George: this fine, fancy lady o' yours 'll never suit me. Give me a smart girl like Mary Smith, and I'll ask no more. Come in to supper now. Mary, Mary."

She raised her voice to call the girl, when a low voice near surprised her.

"Oh, you dressed up in honor o' my boy. Well, I must confess I never knew you had such a handsome dress, and you look like a picture with your net off, and them short, bobbin' curls! George, this is Mary Smith, my——"

George came through the door, and glanced carelessly at the corner where the young woman stood. Then, with a cry, sprang with outstretched arms to meet the little figure that sprang into them. The deacon and Mrs. Clements stood in speechless amazement. Then Marion, all blushes and tearful smiles, went over to the old pair and took their hands.

"I am George's wife. I was so afraid you would never love me, so I came determined to win you if I could. Mother, father, may I be your daughter?"

And a happier family, when they had exhausted their powers of surprise, amazement and pride in the beautiful Marion, never give thanks over a supper table.

ADVICE FOR A DINNER.

AT the restaurant of a wealthy and jolly old caterer in Hamburg, a gourmand who had not a shilling in his pocket, feasted sumptuously on all the delicacies the bill of fare afforded. When he had finished his repast and also drank his bottle of Rudesheimer, he quietly said to the landlord:—"I have no money to pay your bill, my friend; but if you will let me do so, I will give you a piece of advice that is worth more than the money." The landlord, though taken aback at the cool effrontery of his impecunious guest, laughed and said to him, "Well, sir, if you have no money to pay for what you have eaten and drunk, let us have your valuable advice." "All right," replied the stranger, "Now listen:—If ever you should be sent to the penitentiary, and have there to walk on the treadmill, always be sure to choose the left side. You will find it much easier."

SOCIAL SPLINTERS.

A TOUCHING incident is reported from Chattanooga. An utter stranger called on a respectable farmer, recently, and asked him if his house had not been robbed during the war. The farmer replied that it had. "I," said the stranger, "was one of the marauding party that did it. I took a little locket." "That locket," said the famer, bursting into tears, "had been worn by my dear, dear child." "Here it is," replid the stranger, visibly affected; "I am rich: let me make restitution. Here is $20 for your little son." He gave the farmer a $50 bill, and received $30 in change. He then wring the farmer's hand warmly and left. The farmer has since dried his tears and loaded his shot-gun. The $50 bill was bad.

AN aged and rather rural deacon of Danbury somewhat astonished his family, on returning from a recent visit to Bridgeport, by disclosing in the recesses of his capacious valise two valuable volumes in blue and gold, a prize package containing gold coin, a cake of fig paste, two pictorial papers, and a package of ice cream candy. He said a boy on the cars gave him these things. He confessed that the boy was an entire stranger, but fervently hoped "Heaven would paint him a sky blue if he ever forgot the kindness."

"THIS is George the Fourth," said an exhibitor of wax work for the million, pointing to a very slim figure with a theatrical crown on his head. "I thought he was a very stout man," observed a spectator. "Very likely," replied the man, shortly, not approving of the comment of his visitor, "but if you'd 'a been here without victuals half so long as he has, you'd 'a been twice as thin."

AN enraged man tears his hair, but an enraged woman tears her husband's.

Sabbath Reading.

THERE IS NO DEATH.

THERE is no death! The stars go down
To rise upon some fairer shore:
And bright in Heaven's jeweled crown
They shine forevermore.

There is no death! The dust we tread
Shall change beneath the Summer showers
To golden grain or mellow fruit,
Or rainbow-tinted flowers.

The granite rocks disorganize
To feed the hungry moss they bear;
The fairest leaves drink daily life
From out the viewless air.

There is no death! The leaves may fall,
The flowers may fade and pass away—
They only wait through Wintry hours
The coming of the May.

There is no death! An angel form
Walks o'er the earth with silent tread;
He bears our best loved things away,
And then we call them "dead."

He leaves our hearts all desolate—
He plucks our fairest, sweetest flowers;
Transplanted into bliss, they now
Adorn immortal bowers.

The bird-like voice, whose joyous tones
Made glad this scene of sin and strife,
Sings now in everlasting song
Amid the tree of life.

And when he sees a smile too bright,
Or heart too pure for taint or vice,
He bears it to that world of light,
To dwell in Paradise.

Born unto that undying life,
They leave us but to come again;
With joy we welcome them—the same,
Except in sin and pain.

And ever near us, though unseen,
The dear immortal spirits tread;
For all the boundless universe
Is life—there are no dead.

TOTAL DEPRAVITY.

MEN do not like the term *total depravity*. But you might as well expect to find a man born a hundred years old, as to expect to find a man born without a depraved nature. When you shall find a child knowing all arithmetic at one year old, expert in all music at one year old, a universal historian at one year old, an athlete at one year old, full of all temporal wisdom at one year old, then, and not before, will you find another child that is born into this world expert in all virtue, in all truth, in all moral purity, in all upward tendencies. The fact is, men are born at the lowest point of the scale, and work their way up through cycles of inexperience and mistakes and transgressions to the highest point. And it is not a slander to say that men are depraved, unless it be a slander to say that this is the method of the divine creation, or that this is the way that the world is organized.

GONE OUT FOREVER.—Like dropping, dying stars, our dearly loved ones go away from our sight—the stars of our hopes, our ambitions, our prayers, whose light ever shines before us, their place is left empty, cold and dark. A mother's steady, soft and earnest light that beamed through wants and sorrow; a father's strong, quick light, that kept our feet from stumbling in the dark and treacherous ways; a sister's light, so mild, so pure, so constant and so firm, shining upon us, from gentle, loving eyes, and persuading us to grace and goodness; a brother's light, forever sleeping in our souls, and illuminating our goings and comings; a friend's light, true and trusty—gone forever? No! the light has not gone out. It is shining above the stars, where there is no night and no darkness forever and ever.

JEWISH PROVERBS.

THE birds in the air, even, despise the miser.

WHEN the righteous die, it is the earth that loses.

LET the honor of thy neighborhood be to thee like thine own.

THE house that does not open to the poor shall open to the physician.

RATHER be thrown into a fiery furnace than bring any one to public shame.

THERE are three crowns of the law, the priesthood, the kingship; but the crown of a good name is greater than them all.

THE dying benediction of a sage to his disciples was, "I pray for you, that the fear of heaven may be as strong upon you as the fear of man."

"IF your God hates idolatry, why does He not destroy it?" a heathen asked. And they answered him, "Behold, they worship the sun, the moon, the stars; would you have Him destroy this beautiful world for the sake of the foolish?"

HE who has more tendrils than good works is like a tree with many branches but few roots, which the first wind throws on its face; whilst he whose works are greater than his knowledge, is like a tree with many roots and fewer branches, but which all the winds of heaven cannot uproot.

Ladies' Port-Folio.

MAIDENS OF TWENTY-FIVE.

BY MAJASA.

"If I'm not married at twenty-five,
Then I surely will go West;"
Did the maiden dream her thoughtless "if"
Could be more than a careless jest?

But the years have passed—the Spring-time years,
The freshness of girlhood too,
"With my earthly goods I thee endow."—
Comes not—what now can she do?

And still she tarries—and still she waits,
All of hope has not grown dim;
While her friends look grave and shake their heads,
And they think her chance quite slim.

Out West—oh, yes, vast fortunes are made,
There owners wed maidens fair;
But the saying about the "bird and chaff"
Is as true there as elsewhere.

Out West are the plains so grandly broad,
And rivers with shining sands,
But the cottage home, and marble block,
Were not reared by idle hands.

Out West there's work, a large reward,
But not for the drones in the hive;
Somehow the region has not been found
Where the hangers-on can thrive.

Now, ye maidens fair of twenty-five,
Stay where you are if you shirk;
But there is room for the hand and brain,
If only trained for the work.

Out West there's room for woman to work,
Why say what her sphere shall be,
When she gains her hights and wins success,
Look up—all the world and see!

A PLEA FOR MOTHERS.

An article in the Rural of Sept. 14, concerning "Country Women," can hardly be allowed to pass unchallenged by at least one of their number. Will the time ever come when we shall cease to have our respected grandmothers and the good old times held up before our eyes? It is really provoking to hear these notable old ladies praised for wilfully working so hard at all times as to leave to their descendants only enfeebled constitutions and worn out nerves, and then expect them to have the energy and physical strength to accomplish the same amount of hard work that they themselves have done. One cannot help pitying the poor babies and little children of those days, who must have been sadly neglected while the spinning and weaving was going on.

I suppose it is possible for one woman to do the work for a family of twelve; but she must have perfect health and no small children; she must care nothing for reading, so that not a moment need be wasted on newspapers and books; and above all, she must have a perfect enthusiasm for her work; must delight in washing dishes above all earthly enjoyments; must find it her chief pleasure to make soap in the Spring, or apple butter in the Fall; and must be glad of the opportunity of patching old clothes, or darning stockings at any time.

But we cannot all take pattern of this model housekeeper. Most of us have little children whose daily and hourly wants must be attended to. To the mother with constitution enfeebled by the demands of motherhood, who is earnestly striving to take tender care of her little children, to respond always to their incessant wants, and yet to neglect nothing of the manifold duties of a housekeeper, and with only one pair of tired hands to accomplish it all—to this overburdened mother the advice of "Cayuga," "Don't be afraid of work, go at it with a will and do it," will seem like the "last straw on the camel's back." A mother can hardly work calmly with a tear-stained baby-face before her, and two little hands stretched imploringly out to be taken.

In regard to the "complaining women," let me recommend for "Cayuga's" perusal these lines of Shakspeare's:

"A wretched soul bruised with adversity,
We bid it quiet when we hear it cry;
But were we burdened with like weight of pain,
As much, or more, we should ourselves complain."

G. R. B.

THE WESTERN BOYS DEFENDED.

In the Rural New-Yorker of January 13th, I read "An Old Maid's Soliloquy," signed "Uino." Now, although of course *you know* who "Uino" is, it is not to be supposed that *I know*. But "Uino" has written some pretty hard things against us Western boys, and I write this just to let her know that, although there are black sheep in every community, we can show as fine specimens of Nature's gentlemen here in Nebraska as anywhere else—East not excepted.

We have young men who do *not* spend all their time and money in saloons, who do not use tobacco in any shape or form whatsoever, and try to be honest and upright in all their dealings with their fellow creatures, and to do their duty in that state to which it has pleased God to call them. At the same time I am free to own that "Uino" has a great deal of truth on her side; and, what is more, matters are getting still worse, and I blame the present low style of literature for it. I allude to the dime novels, certain magazines, and other papers, most of them illustrated, which no young man, if he had any respect for himself, would read for any consideration. I only wish that every one would look at them in the same light that I do, namely, as *rank but very subtle poisons*.

If I were a girl the three leading questions I would put to a young man who paid me any attentions, would be, "Do you drink beer, spirits, or such like? Do you use tobacco? Do you read dime novels?" If he could not answer these in the negative, I would negative him sharp. Such is the opinion of a

Palmyra, Neb. Western Boy.

WOMAN PERSONALS.

Rev. Phebe A. Hanaford, in a recent sermon, said:—In Boston a father and daughter occupy a law office together; in Chicago a woman—the wife of a judge—conducts the legal newspaper which is authority in legal circles. Woman-physicians are ably and successfully ministering to their own sex all over the land, and to the little children who naturally look first to the motherly hand of woman for help. And I need not remind you that woman to-day stands in the pulpit, for the very fact that you listen to the voice of a woman here to-night, proves a vast area of progress since the day when it was counted disgraceful for a woman to attend your meetings. All doors are open to woman for work; and though all doors are not yet open for her to study in the classic halls from whence her fathers and brothers were graduated, yet the day will surely come when Harvard, and Yale, and Tufts, and Amherst, and Brown, and many another college in the land will rejoice to welcome the granddaughters if not the daughters of the students now within their walls.

Among the interesting ladies in New York society are Miss Selma Borg and Marie A. Brown, the faithful translators of Mme. Marie Sophie Schwartz's works, the famous Swedish authoress. Miss Borg is a native of Finland, and came to America because she despaired of doing her countrywomen much good so long as they were under Russian rule. She is a small woman, with blue eyes and flaxen hair; full of enthusiasm and earnestness in any good work. Besides the Schwartz novels, she is translating those of August Blanche and L. Tapolins. Unfortunately she has had very bitter experiences with some American book publishers, the story of which will soon appear in book form, and promises to produce a sensation.

Some time ago a young American woman found herself deserted and without employment in London. She was an orphan, named Blanche Oswald, who had been induced to go to England from New York as a nurse for the children of a lady who was traveling. Being unable to get work or assistance, she could not lead a life of shame, and would not beg; so she committed suicide by precipitating herself from the parapet of Waterloo Bridge into the Thames. Since then no less than three suicides have occurred in one day from the same bridge; all, doubtless, suggested by the unhappy fate of the American girl.

The Hon. Mrs. Meynell-Ingram is the wealthiest woman in England, as well as a widow of many attractions. This young lady, who is about twenty-four years of age, is the daughter of Lord Halifax, better known as Sir Charles Wood, and is probably the wealthiest of widows. She married about two years ago Mr. Hugo Meynell-Ingram of Temple Newsam, in Yorkshire, and Hoar-Cross, in Staffordshire, who at his death bequeathed to her $250,000 a year in land absolutely. She has no children. Speculation is already rife as to the man on whom her second choice will fall.

Miss Mary Elizabeth Chantrell of Rottingdern, England, a person of property, had a mania for collecting cats and dogs, so that she had under her roof no fewer than thirty of the former and forty-three of the latter. Last Spring she left her home and quadrupeds in charge of a couple of servant girls; but she forgot to leave any money for victualling the menagerie and the girls. The latter, as the tradesman refused credit, took their leave, and the unfortunate pets were shut up without food, in consequence of which some of them were forced to kill and eat their companions.

Kate Field complains that at the Paris banquet to Stanley, the discoverer of Livingstone, women were studiously neglected. The American women were anxious to honor Stanley, but since they could not do that, some of them assembled in the halls of the Hotel Chatham, where they pounced upon the African boy, Kalulu, showering him with kisses. At the Stanley dinner given by Sir Charles Dilks in London, women were present.

Miss Nellie Grant (the President's daughter), it is announced, is to "come out" this season—which means that the chrysalis girl is to become the butterfly woman. Accordingly other Washington young ladies are to follow suit and suit themselves with suits which will cost their dear papas heavily—more than the unapproachable costumes of the butterflies of Summer.

One Miss Aurora H. C. Phelps of Boston, has issued a call to the "True Friends of Progress," to form a new political party. She bases her call upon the vital element of woman's right to unrestricted industrial or other education, free choice of employment, and a self-sustaining, independent homestead ownership.

Reading for the Young.

THE AMERICAN GAME.

Each one of the players must have two slips of paper; on one write a noun, and on the other a question. All the papers are to be thrown together (after being folded so the writing cannot be seen), and each player takes one of the questions and one of the nouns, and writes an answer, bringing in the noun. It is an amusing and intellectual game. The following are specimens and will exhibit the mode:

Would you like a diamond ring, and why?

Noun—*California.*

Once I liked a diamond ring,
For the hope it brought to me,
That in years that were to come,
I should be no longer free.

And I like my diamond ring,
Better still for it is old,
And beneath it now there lies
One of *California* gold.

Which is the happiest, the bachelor or married man, and why?

Noun: *Codfish Ball.*

Which is the happiest, can you tell,
One that's wed or one that's not?
Is a single life the best,
Or a double one the happiest lot?

Hot cakes has the married man,
And everything the best of all;
While bachelors have nothing else
But crusty bread and *codfish ball.*

Is it wrong to confine birds in cages?

Noun: *Scissors.*

If I were a little bird,
I could better answer true,
Whether we are doing wrong
To confine him as we do.

But sometimes he seems to say,
As he flutters to and fro,
Bring your *scissors*, lady dear,
Loose my fetters, let me go.

Which do you prefer, fact or fiction?

Noun: *Gum Drops.*

Facts are stupid things, you know,
And hum-drum every way;
They always happen just so-so,
To Saturday from Sunday.

In fiction everything is nice:
If you for *gum drops* long,
Your fancy brings them in a trice,
Of every size and form.

Not for novels do I plead,
Or lying tongue approve,
Fancy and fiction often lead
To virtue and to love.

Myra Forrest.

THE BIRD KINGS.

BY FRANK FERN.

The big birds were to have a kingdom. They held a meeting in the tops of the high trees, and there came Hawks, Crows, King-birds, Robins, Jays, and all the large birds of the air except the owl. He had been invited, but when it was told him that it was to be held in daylight he refused to come. The smaller birds were not allowed to come, for it was over them that the large birds were to be kings, and it was feared they would refuse to be governed if the plans were discovered.

The meeting was gravely opened by Mr. Hawk, who gave a short speech expressive of his approval of the kingdoms, then laid a plan for the different kings before them. The Robins, King-birds, and other such birds, were to have the orchards, and with them their children were to live as princes. The birds of prey were to have the forest for their government. There was one law that all the small birds in their domains were to be held as servants to the kings, to build their nests and bring them food.

Great was the sorrowing among the little birds when the kings came. Each king had a large number of Sparrow Hawks as an escort. These birds had had no kingdom given them, but were to be the body-guard of the other kings, and share with them the spoil of the nests which were to be destroyed.

There was one orchard in which a large barn stood, and beneath its eaves Swallows had built their nests undisturbed for many years. In the trees were many nests of Bluebirds and Sparrows, while in the old stumps Wrens had taken their homes. There were many, many birds, and they had made sweet music all the Summers before. But a large family of King-birds came here to govern it, and the Sparrow-Hawks were ordered to tear down the nests. Cruelly was this order obeyed, and the young birds became food for the king's escort. And then the birds were set to work making nests for the king, and little straw and mud houses, upon the corner of the orchard, for the Sparrow-Hawks. The Swallows brought the mud, the Sparrows the straw, and the Bluebirds built them, while the little Wrens brought the food; and the great fellows ate so greedily that they were glad indeed when night came.

"Woe is me," said a Swallow, lighting upon a mud hole where the mortar was got for the nests. "My wings are too tired to bear my weight longer, and I have been so busy I have not had a chance to catch a morsel of food."

A little Chipmunk sitting upon a stump close by heard the Swallow's complaint, and rolled a kernel of wheat down to him.

"Many thanks," said the Swallow, picking it. "I've seen how things were going," said Tom Chipmunk, "and I wouldn't stand it—no, not I!" and he raised his tail above his back in an independent way.

"What would you do?" meekly asked the Swallow.

"Stop 'em up! Stop 'em up!" and Tommy chuckled all over at the idea, so that he rolled from the stump.

"Stop 'em! How?" inquired the Swallow, pleased to see Tommy so tickled.

"Cover them over with mud, then they can't get out. Caught in their own nests, he! he!" chuckled Tommy, scampering into his hole.

Up flew the Swallow with his mud, and stealthily told his companions what Tommy Chipmunk had said. Tommy was held as quite an oracle among the birds, and that day a secret meeting was held at the mudhole, at which Tommy expressed his ideas again. So it was agreed that a roof should be made over the nests at first, and then the hole completely sealed up by the Swallows.

"Would you not like a roof over your nests?" asked the little birds of the king.

"Oh do, papa; it will be so grand, and astonish king Robin when he comes to see us," said the Crown Prince.

"Yes, do! do!" echoed all the other princes.

"And shall we not build them over the police houses, also?" again asked the little birds.

"Yes, let it be done to-day," quoth the king.

So that day roofs were made over the nests of the king and family, and over the Sparrow Hawk's nests, and they were all closed up except the holes in front through which they were fed; and the king and the princes thought it was all very nice. But that night the Swallows brought more mud, and the Sparrows more straw, and the holes in front were closed up tight, shutting in the king, the princes and the Hawks. And the next morning the birds all met at the stump where Tommy lived, and sang a song so loud that Tommy awoke; and that day he made a great feast for them, and invited some of his family, who brought wheat and corn and nice fruits, and such a day for the birds was never again seen.

The Puzzler.

MISCELLANEOUS ENIGMA.—No. 4.

I am composed of 99 letters:

My 1, 17, 20, 72, 47, 79 is an animal.
My 2, 16, 36, 50, 41, 85 is a fruit.
My 5, 24, 45, 30, 56, 76 is a bird.
My 11, 43, 62, 96, 3, 87 is a plant.
My 12, 35, 49, 88, 99, 28 is an animal.
My 15, 8, 37, 59, 83, 6 is a bird.
My 19, 45, 86, 8, 62, 82 is a tree.
My 22, 9, 48, 32, 60, 93 is an animal.
My 23, 18, 16, 11, 61, 75 is a bird.
My 26, 10, 7, 69, 97, 55 is a fish.
My 27, 53, 4, 58, 20, 58 is a tree.
My 30, 80, 65, 92, 77, 25 is a reptile.
My 34, 70, 11, 20, 95, 31 is an insect.
My 41, 14, 71, 3, 68, 52 is a bird.
My 42, 4, 13, 67, 41, 12 is a vehicle.
My 44, 75, 90, 63, 13, 6 is an animal.
My 51, 21, 64, 41, 2, 33 is a reptile.
My 57, 30, 39, 73, 17, 94 is an insect.
My 62, 3, 54, 31, 22, 66 is a bird.
My 71, 18, 98, 15, 35, 10 is an animal.
My 81, 92, 9, 89, 84, 47 is a bird.
My 91, 29, 12, 46, 10, 36 is a flower.

My whole is a poetic quotation.

Sheffield, Pa. Isola.

News of the Week.

CURRENT TOPICS.

Thanksgiving.

WASHINGTON, D. C., October 11.

By the President of the United States of America.

A PROCLAMATION.

Whereas, The revolution of another year has again brought the time when it is usual to look back upon the past, and publicly thank the Almighty for His mercies and his blessings; and

Whereas, If any one people has more occasion than another for such thankfulness, it is the citizens of the United States, whose Government is their creature; subject to their behests; who have reserved themselves ample civil and religious freedom and equality before the law; who, during the last twelve months, have enjoyed exemption from any grevious or general calamity, and to whom prosperity in agriculture, manufactures, and commerce has been vouchsafed.

Therefore, by these considerations, I recommend that on Thursday, the twenty-eighth day of November next, the people meet in their respective places of worship and make their acknowledgments to God for His kindness and bounty.

In witness whereof I hereunto set my hand and cause the seal of the United States to be affixed.

[L. S.] Done at the City of Washington this eleventh day of October, in the year of our Lord one thousand eight hundred and seventy-two, and of the independence of the United States the ninety-seventh.

(Signed) U. S. GRANT.

By the President:

Hamilton Fish, Secretary of State.

The Western Union Telegraph Company.

AN annual meeting of the stockholders in this Company was recently held in this city. From the report of the operations of the Company during the last fiscal year, ending June 30, 1872, made by the President, Wm. Orton, we glean the following interesting facts and figures:

On the 30th of June, 1872, the Company operated 62,032 miles of line with 157,109 miles of wire. All this is operated through 5,237 offices. The increase during the year past was 6,000 miles of line, 16,039 miles of wire, and 631 officers. To perform the labor required for such operations the Company has in its employ 8,347 operators, who last year transmitted 12,444,499 messages, being an increase of 1,788,422 over the year preceding. The gross receipts for the year were $8,457,095.77, the expenses $5,606,863.16, leaving a net profit of $2,700,232.61, which is an increase over the last year of $819,646.92 in the gross receipts, $562,075.97 in the expenses, and $257,570.95 in the net profit. During the past year the Company has introduced one of the most important inventions for the transmission of messages which has been made since the telegraph first went into operation. This is the duplex telegraph invented by Mr. J. B. Stearns, by means of which messages can be transmitted in opposite directions on a single wire at the same time. It has come into very general use, and has afforded vastly increased facilities for telegraphing. The present Western Union system dates from the consolidation of the United States, the Southwestern, and the American companies in 1866, and its net profits during that six years ending June 30, 1872, amount to $17,116,091.23. Of this sum $4,856,879.34 was distributed to the stockholders in dividends, and $1,808,401.08 disbursed for interest on the Company's bonds. The balance—$10,361,412.91—was expended in the construction of new lines, the erection of additional wires, and the purchase of telegraph property.

James Anthony Froude.

THIS distinguished historian has arrived in this country, and is to deliver five lectures in New York City. His subject is to be "The Relations Between France and England." As a historian, Mr. Froude is supposed to be preeminently qualified to give us information on this subject. He will tell us a good deal of Irish character—give us, probably, an exhaustive analysis of it, since he has studied it in Ireland, where he has resided for the purpose of such study. The titles of his lectures are:—"The Norman Conquest of Ireland," "Ireland Under the Tudors and Stuarts," "The Penal Laws and Their Consequences," "Grattan and the Volunteers," "The Rebellion of 1798—the Union and the Ireland of To-day."

The British Chancelor of the Exchequer Compliments the United States.

IN a recent speech in Glasgow, Right Hon. Robert Lowe said: "America came out of a gigantic civil war bleeding at every pore, and with feelings very much excited and irritated. To her eternal honor be it said, she offered a unique instance in history. In her case no 'statutes glean the refuse of the sword;' no executioner was called on to finish the work the soldier had left undone. Whatever blood was shed was shed in the height of violent conflict. No blood, no mockery of judicial proceeding, no semblance of impartiality where the sentence was predetermined on and the executioner was ready, clouded the triumph of that civil war, and for that America deserves immortal honor." (Cheers).

Prince Napoleon and Princess Clothilde.

PRINCE NAPOLEON and the Princess Clothilde were in Paris, Oct. 11. At that date they received orders from the Government to quit France. Prince Napoleon refused, insisting on his rights as a citizen of France to live there, and declaring he would only yield to force, while the Princess announced that she would only leave France between two gendarmes. A later dispatch reports that the Prince has obeyed the order. This news indicates what is shadowed in other dispatches, that the Government of the Republic has something to fear from the intrigues and activity of the Bonaparte party in France.

Thiers and Gambetta in France.

GAMBETTA is stirring up France against the present President of the Republic. M. Thiers says he (Gambetta) is trying to divide the nation. So he is. He seems to be too much of a Republican in principle to be willing to submit or allow the French people to submit to a dictator with the title of President. He does not seem to comprehend that kind of Republican freedom which gags the press, forbids criticism of Government measures and acts and continues to shoot Communists. Nor does he appreciate a President who holds his tenure of office by threatening to resign if the Legislative Assembly does not do his bidding. Evidently Gambetta is willing Thiers should resign.

Chicago One Year After the Fire.

OCTOBER 9, 1872, the anniversary of the Chicago fire, was celebrated by the Chicagoans in a characteristic manner—by the removal of many of its leading business firms from their temporal places of business to their new blocks, and by the re-entry of the Board of Trade into the New Chamber of Commerce erected on the site of the old building. The amount of building done during the past year in the burned district almost transcends belief, and Chicago, from this time henceforth, will assume its rightful place among the great cities of the Continent.

The October State Elections.

THE three great States of Indiana, Ohio and Pennsylvania have held their State elections since our last issue. The result is the Republican State ticket in Pennsylvania is elected by (variously given) from 25,000 to 35,000 majority. In Ohio the State Republican ticket is elected by over 15,000 majority. In Indiana the Republican State ticket (except Governor) is elected by nearly two thousand majority. Hendricks, Democratic candidate for Governor, it is claimed has a majority of between 600 and 700.

Brigham Young on Gentile Schools.

ONE of the Elders having publicly advised the Mormon brethren to keep their children out of Gentile Schools, Brigham Young, the Head of the Church, arose and rebuked him, and stated that he was glad to see the Mormon children attending Gentile Schools, and encouraged his subjects to continue to send them there. This is regarded as a new Mormon departure.

The Famine in Persia.

WE can scarcely believe a telegram which comes from Constantinople, dated Oct. 10, 1872, to the effect that "it is estimated that 3,000,000 inhabitants died of famine in Persia. This cannot be true; if it is, it is a reproach upon modern civilization. Somebody somewhere is terribly responsible for it, for America alone could and would have saved those 3,000,000 lives with her surplus products.

Prof. John Tyndall

HAS arrived in New York, and is to lecture in Boston first, and about the middle of November in New York. His reputation as a scientist, and his acquirements, cause the anticipation of great pleasure from his lectures and demonstrations among students of physical science here.

SEMI-BUSINESS PARAGRAPHS.

In calling attention of our readers to the advertisement of H. W. JOHNS, on the last page of this paper, we refer them to the following letter:

ROCKFORD, ILL., Sept. 7th, 1872.

C. L. RICE & CO., Chicago, Ill.:

Dear Sir:—Yours of yesterday, asking for my experience with *H. W. Johns' Patent Asbestos Roofing*, duly received. In answer, would say, I have used Mr. Johns' Roofing and Coating extensively for *ten years* past, and with great satisfaction. I have applied it to more than three hundred roofs in Rockford, Ill., and adjacent country. I have roofs in Rockford that have been on *eight years without repairs*—they are sound and good, and by simply recoating will last as much longer. I have seen and tested many kinds of Composition Roofing during the past ten years. I have seen nothing that comes up to "Johns' Patent Asbestos."

Truly yours, L. M. WEST.

The New Wilson Under-Feed Sewing Machine is a perfect lock-stitch machine, making a seam alike on both sides, and is adapted to every grade and variety of family sewing. It does to perfection embroidery, hemming, cording, braiding, fine and coarse sewing of all kinds, with less machinery and complications than any other machine in use, and is sold at two-thirds the price of all other first-class machines. Be sure to call and see it. Salesroom at 707 Broadway, New York, and in all other cities in the United States. The Company want agents in country towns.

Watch No. 12006, Stem Winder—bearing Trade Mark "United States Watch Co., Marion, N. J."—manufactured by the United States Watch Co. (Giles, Wales & Co.), has been carried by me three months; its total variation from mean time being only two-thirds of a second per day.—Judge CHAS. H. VOORHIS, Hackensack, N. J.

Facts for the Ladies.—MARY J. CLOCK, New York, has used her Wheeler & Wilson Lock-Stitch Machine fifteen years, averaging, for the last five years, more than $500, making boys' suits and general sewing. See the new Improvements and Woods' Lock-Stitch Ripper.

Advice.—Send for free Price List. JONES SCALE WORKS, Binghamton, N. Y.

THE MARKETS.

MONEY AND TRADE AFFAIRS.

NEW YORK, Monday, Oct. 14, 1872.

THE past week was in favorable contrast, for business people, to the previous week of distrust and pressure for Money. The Government on last Monday came to the relief of both the Gold and Money markets, to the extent of selling five millions of Gold, the proceeds of which were left in the National Banks to be drawn out for Treasury disbursement hereafter and in gradual sums, and of buying five millions United States 5-20 Bonds for the Sinking Fund, paid for in Greenbacks out of the Treasury. The effect upon the Bank movement, on the averages of the week, was to add over six millions of dollars of the Lawful Money held by the Banks, and to leave a surplus of Lawful Money of $3,500,000 over the required 25 per cent. to Deposits and Circulation. The previous averages showed the Banks to be under this line by $1,500,000.

The Money Market immediately felt the influence of this change, and rates to the Merchants outside of Banks fell 2@3 per cent. per annum. Good paper can now be sold at 8@12 per cent. per annum. The Banks themselves are doing more for the Merchants at 7 per cent. The Stock Brokers are getting Money on call loans at and below 7 per cent.

The speculators who had been cornering Gold at 14⅝@15 per cent. were undersold by 2@2½ per cent., the sales falling to 112⅝@112¾ per cent.

The Stock Market also shows decided improvement, and the popular elections of Tuesday last contributed to financial confidence, which had been previously disturbed by the violent excitement of the Presidential canvass.

General Trade is falling off, as usual, in October, in the Dry Goods line, but is otherwise active and more satisfactory than a week or two since. The Cotton, Grain, and Provision markets move more cheerfully; the exports are larger, and prices generally better, the most decided advance being in the Cotton trade. The Bank of England has advanced the rate of interest to 6 per cent., and while this has not affected the Cotton trade at Liverpool, it has helped to advance the rates of Exchange here, which had previously been depressed by the scarcity of Gold.

The following are the comparative movements of the City Banks for the past fortnight:

	Oct. 5.	Oct. 12.
Capital	$87,315,700	$87,315,700
Loans	269,510,300	268,298,300
Gold and Greenbacks	51,850,600	57,936,800
Deposits	186,150,200	189,709,300
Circulation	27,901,200	27,737,900

PRODUCE AND PROVISIONS.

NEW YORK, Monday, Oct. 14, 1872.

Receipts.—The receipts of the principal kinds of produce since our last are as follows:

Corn, bush	1,349,500	Meal, bbls	4,500
Oats, "	219,600	Flour, "	89,090
Wheat, "	465,000	Eggs, "	7,340
Rye, "	—	Cotton, bales	19,465
Barley, "	152,400	Hops, "	509
Malt, "	20,800	Wool "	890
Seed, "	600	Butter, pkgs	19,250
Beans, "	8,900	Cheese "	15,400
Meal, bags	682	Lard, "	2,829
Peanuts "	1,600	Dried fruits, pkgs	2,339
Pork, bbls	392	Cut Meats "	949

Beans and Peas.—The new crop of beans is being shipped forward freely and our supplies are somewhat burdensome at the moment, as the outlet is very light. For mediums it would be difficult to obtain $2.50 for a full lot. Canada peas are higher, with a sale at $1.08, in bond. Green peas have a light sale.

We quote Mediums, prime $2.50@2.60 per bushel; good do., $2.30@2.40; fair do., $2.00@2.25; prime marrowfats, $2.65@2.70; good do., $2.40@2.50; common and fair do., $2@2.25. Green peas at $1.80@1.90.

Beeswax.—We have more Southern stock than is needed, and prices are down. Sales at 34@34½c. Western sells at 34@34½c.

Broom Corn.—New begins to come in and there is more inquiry, with a number of small sales made at the quotations. We quote at 3@5c. for red, 3@6c. for green, 7@8c. for hurl.

Butter.—The receipts begin to be quite liberal and shippers are thereby wisely attending to the advices of prominent and disinterested dealers here, who think that the recent tendency to hold back stock has been injudicious, even for the moderate period wherein it has existed. We are now having favorable cool weather, and it is what we want in order to start second-class table grades into consumption. The demand has been so exclusively upon fine for the past month that dealers have become quite perplexed in ability to renew fulfillment of the orders for an even run of choice. We may expect a larger volume of business just as soon as buyers will acknowledge the useful and salable quality of a large proportion of the receipts that have not come up to the fashionable standard. Quotations are not specially changed, though dealers feel that every day may vary the ranges in favor of buyers, and there is weight in the supposition, as many sellers have had to put up with a moderate run of business, while the call has been for top grades only, and they are all ready to shade prices for good market grades.

Orange Co. pails, fine, 33@35c.; Penn. and N. J. pails, good to fine, 25@33c.; common, 15@18c.; selections, half tubs, 31@32c.; half tubs in lots, 27@29c.; good to prime firkins, 26@28c.; do. Welsh, Fall, 26@28c.; Welsh tubs, fair, 20@23c.; other grades of State, 18@22c.; Western Reserve, choice, 21@22c.; Western fair to good, 13@15c.; common, 10@11c.; grease butter, 7½@8½c.; Pa. and N. J. pails, medium to fine, 26@30c.; poor, 15@18c. State dairies, 26@28c.

Cheese.—The arrivals have been liberal of late made stock, but there is no excess in the supply. The home trade is brisk, and we hear of sales made as high as 15c. in this way, but this is an exceptional price, 14½c. being about the ruling figure. Advices from the other side speak of the market there as being in a very satisfactory position, the consumption showing an increase over last year, and a higher and firm market—14½c. is paid by shippers here for prime stock with some little business. A much larger trade would have resulted if freight room had been plenty.

We quote State factory, choice, 14¼@14¾c.; good to prime, 13¾@14c.; fair, 12¾@13¼c.; State dairy, 13@13½ for good to prime, 12@13c. for fair lots; for Ohio factory, 13¾@13¾c. for good to prime; English dairy, prime, 13½@14c.; fair do., 11½@13c.

Cotton.—The demand has been very fair from exporters, and prices are a trifle higher.

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	15	16	16¼	16¼
Good Ordinary	18¾	18¾	18¾	18¾
Low Middling	19	19¼	19¼	19¼
Middling	19¾	19¾	19¾	19¾
Good Middling	20¾	20¾	20¾	20¾

For forward delivery the prices are in the seller's favor, with a good business. Sales on the basis of low middling are as follows:—Nov., 18½c.; Dec., 18⅝c.; Jan., 19c.; Feb., 19⅛c.; March, 20c.

Dried Fruits.—A few lots of common apples have been taken by shippers at a low price, said to be 3½c. The fine grades are worked off a little better to the home trade at about late prices. Peeled peaches are firm. Other goods sell slowly.

Southern apples, 3½@3¾c.; do. sliced, 8@9c. Peeled peaches at 14@17c. for Ga., 14@16c. for Va., and 17@22c. for North Carolina. Unpeeled peaches at 5c. for quarters, and 6@6½c. for halves. Cherries, 22½c. Plums, 14@19c. Blackberries, 9@9½c. Plums, 14@15c.

Eggs.—The arrivals are large and prices are lower. Sales of fresh at 26@27c. for Western, 28@29c. for State, Pennsylvania and Jersey. Limed, 24@25c.

Flour.—Prices have been unsettled and generally in the buyer's favor. Low grades of extra bring the best prices relatively, as they are wanted by shippers.

Superfine State	$6 00	@	6 45
Common extra do	7 00	@	7 20
Good to choice do	7 25	@	7 45
Fancy do	7 50	@	7 90
Superfine Michigan, Indiana, Ohio, Iowa	6 00	@	6 40
Extra do	7 00	@	7 40
Choice extra do	7 45	@	8 20
Shipping brands round hoop Ohio	7 15	@	7 45
Trade brands do	9 50	@	9 75
Good to choice white wheat extras	8 20	@	9 55
Fair to very choice extra Minnesota	7 75	@	9 50
Common to fair extra St. Louis	7 60	@	9 20
Good to choice do	9 25	@	11 25
Extra Southern	7 45	@	9 75
Good to choice do	9 80	@	12 00
Rye, common to fine	4 35	@	5 35
Corn meal, Western	3 40	@	3 75

Fresh Fruits.—Apples are in good demand, as they are not interrupted with so large a variety of other fruits. Very fine Western State stock is firm at the outside rate. Fine pears are bringing fancy prices, extras frequently bringing $@$ above the ordinary packed stock. A car load of California, from Santa Clara sold by auction at $5 per box. They were mostly Buerre Clairgeau. Plums are dead stock, quotations are nominal. Quinces are not plenty yet. Cranberries are higher, as some reliable accounts of the crop have been obtained. There is a good crop at the West but few will come this way. At the East, including Cape Cod, the crop is estimated at 40,000 bushels, and for New Jersey 100,000 do. The Western yield will about equal these totals. Grapes are in good demand, Catawbas running the best in quality. Chestnuts are very plentiful and have largely declined. Hickory nuts are also lower. We quote:—Apples, prime, $2.00@2.75; mixed, $2.12@2.37; fair, $1.25@1.75; common, $1. Pears.—Fine Duchess, Seckel, Louis Bonne, Virgalieu, B. Diel, $12@15; rough lots do., $8@10; cooking, $5@6, which is better. Grapes.—Concords, 7@10c.; Delaware, 9@11c.; Ioua, 10@12c.; Isabella, 7@8c.; Catawba, 9@11. Cranberries, per crate, fine, $3.50@3.75; other, $2.75@3; bbls., $12@12.50 for Cape and $9@11 for N. J. Old peanuts lower, as we are on the eve of new crop; Wilmington, $1.50; new have sold in a small way at $2. Chestnuts, per bush., $3@3.50. Hickory nuts, $1.50.

Grain.—For wheat the inquiry has been small, and notwithstanding light arrivals prices are more in the buyer's favor. We quote at $1.48@1.53 for No. 2 Spring afloat; $1.63@1.65 No. 1 do.; $1.58@1.65 for Winter red Western; $1.68@1.75 for amber Western; $1.70@2.05 for white. Rye is quiet at 82c. Barley is dull at $1.05 for Milwaukee, and $1.15 for Canada West. Sales of Western malt at $1.25. Corn is lower with a moderate trade; steamer lots of Western mixed, 62½@63, 64 for sailing do., 64½c. for high mixed. Oats are higher and in light supply; black Western, 40@45c.; new mixed do., 43@44c.

Hay and Straw.—The demand is improving, and prices are now firmer. We quote new shipping hay at $1@1.05; retail do., $1.35@1.40; salt, do., 55@80c. clover, 75@80c.; Straw at $1@1.05 for long rye, 75@85c. for short rye; 70@75c. for oat.

Hops.—Receipts are small, as growers and buyers in the interior are still far apart in their views. The stocks have worked down to a remarkably low figure, for the season, and prices are firmer. No arrivals of foreign of consequence.

New York, growth 1872, at 25@30c.; Eastern do., 25@30c.; Western do., 25@30c.; Yearlings '71 nominal; Olds '70 nominal; Old Olds, '68–69 10@15c.; Bavarians, 35@40c.; English, 25@30c.

Poultry and Game.—Trade this week has been much lighter, and with the liberal arrivals prices are lower. Dressed are offered more freely, and quoted at 19@20c. for Western chickens 19@21c. for State fowls and chickens. Turkeys, 19@23c.

We quote live:—Turkeys, Jersey, per lb., 19@20c.; do., Western, 17@19c. Ducks, Jersey, per pair, $1@1.50; do., Western, 75@87c. Geese, Jersey, young, per pair, $2.50@3; do., Western, $2@2.50. Spring chickens, Western, per lb., 17@18c.; do., Jersey, 19@20c. Fowls, Jersey, 18@20c.; do., Western, 16@17c.; roosters, 10@11c.; partridges, per pair, 65@87c.; grouse, do., 75c.; woodcock, do., 62@75c.; pigeons, light, picked, per doz., $1.25@1.50; do., feathered, do., $1@1.25. Hares, per pair, 50@75c.

Provisions.—There is quite a fall in pork; there are very few sellers, but a few forced sales are quoted considerably lower than the prices current during the excitement. Oct. sold at $14.30, jobbing lots $14.40@14.50, old mess $13.37, Eastern prime $11.50. Prime mess is withheld with bids at $13.35. Beef is quiet, only a few bbls. are moving. We quote $5@8 for plain mess in bbls.; $8@10 for extra do; tes., $12@16 for prime mess, and $17@20 for India. Beef hams in light demand at $27. Cut meats are steadily firm, owing to the continued high price of dressed hogs, which are quoted at 6¾@7¾c. for packing sizes. Smoked hams, 16@17c.; city pickled hams, 14@16¾c.; shoulders smoked, 9c.; shoulders pickled, 8¼c.; bellies, 8¾c. Bacon is firm for spot, at 9c. for long clear. Future Western cured dull and easier. Lung and and short clear together have sold for Dec. at 7¾c., and short for Jan. Sc. Lard is quiet at 8¾c. for W. steam contract, though there have been some fair sales of that description for continental use. New lard quoted 8¾@8¾c. City is quoted 8¾c.

Seeds.—Sales of grass are only of small lots. Timothy is selling at $3.75. Clover at 9¾c. for Ohio, 10¼c. for Indiana and Michigan, and 10½c. for State. Rough flax is unchanged, quoted at $1.35.

Sundries.—The market for honey opens with unusual vigor, with white bought up freely. Small lots of honey quoted at 20@22c. for dark and 25@30c. for light, in glass boxes; mixed lots, 21c. Cider plentiful, at 6@10c. per gal. Feathers, live geese, new, fine, ℔ lb., 60@70c.; do. mixed, 40@50c.; hen, 7@9c.; vinegar, cider, ℔ gal., 20@25c.; do. manufactured, 15@20c.; newspapers, ℔ lb. 4@4½c.; white rags, 5@5½c.

Tobacco.—Stocks are steadily decreasing, and the tone of the market is a confident one.

QUOTATIONS—NEW CROP.	Light Grades.	Heavy Grades.
Lugs	9¼@ 9¾c.	9¾@10¼c.
Common to medium leaf	10 @10¾c.	10¾@11¾c.
Good do.	11 @11½c.	11¾@12¾c.
Fine do.	11¾@12½c.	13 @14 c.
Selections	13 @14 c.	15 @16 c.
NEW CROP.		
Connecticut and Massachusetts fillers	14	@16 c.
seconds	20	@35 c.
wrappers	40	@55 c.
selections	50	@75 c.
New York State running lots	12	@16 c.
Pennsylvania assorted lots	18	@25 c.
Ohio running lots	12	@16 c.
Ohio wrappers	16	@30 c.
Wisconsin and Western	9	@10 c.

Vegetables.—There is talk of rot prevailing in potatoes extensively, and although it is not credited by some parties, still there is a firmer market and less disposition to force sales on hand stock. Sweets cannot be sold to any extent, with prices very low.

Early Rose, bbl., $1.75@2.12; Jackson White, $1.50@1.75. Peach Blows, $2.25@2.50. Tomatoes, 75c. Squash, per bbl., $1@1.50 white and yellow. Cabbages, $8@10. Onions, red, ℔ bbl., $2.75@3.00; yellow, $3.25@3.50. Sweet potatoes, $2.50@3. Pumpkins, $7@8. Garlic, per 100 bunches, $16@18. Russia turnips, ℔ bbl., $2.50@3.

Whisky—Selling at 92c. for Western.

Wool.—The auction sale during the week brought irregular prices and it failed to create regularity in the regular market. There are free sellers at late prices with very little inquiry. We quote fleece at 50@55c. for New York and Michigan; 52@53c. for Ohio; 50@55c. for Indiana and Wisconsin; 47@53c. for Illinois; 50@55c. for Texas, fine; 30@35c. for do. coarse. Pulled, 50@60c. for extra.

ROCHESTER, Oct. 11.—Flour is firm at $8.50 for red Winter, $9.50@10 for white. Wheat is in demand and higher, selling at $1.60 for red Winter and $1.65@1.80 for white. Corn, 67@68c. per bushel. Oats dull, at 40@41c. for new. Barley is in better demand, at 75@80c. for two-rowed and 90c.@$1 for four rowed. Hops, 35@40c. ℔ lb. Dressed hogs, $7 per cwt. Wool continues dull, at 40@43c. for medium and 45@48c. for coarse. Butter is scarce and higher, selling at 24@26c. for best. Eggs, 25c. per dozen. Apples, $1@1.50 per bbl. Potatoes, $1.13 for Early Rose; no market for Peach Blows yet; the potato crop is light because of drouth. Hay continues scarce, at $16@22 per ton.

COUNTRY CHEESE MARKETS.

Little Falls, N. Y., Oct. 12, 1872.

THE market at Little Falls for the week ending Oct. 12th was dull, with an inclination on part of buyers to make light transactions. The delivery of farm dairies amounted to about 800 boxes, including that shipped by canal. Prices ranged from 12 to 13¾c., the latter figure being top price for fancy grades.

In factories the offerings were large, and sales comparatively light. We give quotations of leading transactions as follows:

Brockway	13¾	Manheim	14
Brookman's Corners	14	Manheim Turnpike	14¼
Crum Creek	14	Mohawk Valley	13¾
Cruine's Corners	14¼	Mother Creek	14
Danube Cold Spring	14¼	Purchase	13¼
Fays	13¾	Snell's Bush	14¼
Freeman	13¾		

Good fresh butter, in Welsh tubs, is coming forward in small quantities, and sells readily at 27@28c.

We have advices from abroad for the last week in Sept. Our London correspondent says the trade in American cheese is rather quiet, and some recent arrivals have suffered from heat. Extra fine is quoted at 62@63s.; fine, 60@61s.; good, 56@58s. Other descriptions of cheese sell as follows:—English Cheddar, 74@84s.; Wiltshire double, 60@72s.; Cheshire medium, 54@66s.; fine, 72@80s.; Scotch, 68@76s. Dutch cheese:—Edams, 56@62s.; Gaudas, 54@58s.; Derby shape, 54@60s.

Butter is in good demand, and at advanced rates. For best Clonmells, 128s.; Corks, 127s.; Normandy, extra, 130s.; Canadian, 50@96s. The corresponding prices last year were, for American cheese, 60s.; Clonmells butter, 128s.; Corks, 128s.

The weather in Herkimer, N. Y., is warm and showery. Afterfeed is abundant, and has not been injured by frosts.

LIVE STOCK MARKETS.

NEW YORK, Oct. 12, 1872.

THE weather continues favorable for the trade in all descriptions of butcher's stock, and for good beeves, sheep, lambs, calves and hogs the demand is increasing; but too many common beef cattle have been offered, and of late the receipts of sheep and lambs have exceeded the actual needs of the butchers.

RECEIPTS OF LIVE STOCK.

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.
Totals this week	9,009	66	2,452	25,371	49,093
" last week	9,831	80	2,490	28,197	42,259
Average last year	7,187	83	2,301	25,132	25,177

Beeves.—The receipts show a falling off of 825 head compared with the previous week. The market has been extremely dull throughout the week for everything except fat, matured steers, which have been scarce. The firmer feeling and slight advance in prices on all grades in the West, and the fully sustained prices at Albany and Buffalo yesterday, strengthened the confidence of the holders, who, refusing to yield to the views of the buyers, now have a number of car loads on hand. Texas and Cherokee cattle, some of the latter unusually good, were sold at 7¼@10¾c., and common to prime native steers at 9¾@13¾c.; selections from the best droves at 11@11½c.

The following are the closing prices for the week in comparison with what cattle brought one week ago, for net weight of beef:

	This week. Cents.	Last week. Cents.
Choice beeves, ℔ lb	11 @ 14¼	13½ @ 14½
Good to prime	12½ @ 13½	12½ @ 13¼
Medium	11 @ 11¾	11 @ 11¾
Poorest grade	7¾ @ 10¾	7½ @ 10
Average sales	11¾ @ 11¾	11¾ @ 11¾

Milch Cows.—A slightly improved demand, and a shade firmer feeling with increased receipts and a larger trade at previous quotations, were the features of the market for the week. Common to very good cows were sold at $35@70, a few choice to private parties at $75@85.

Calves.—The demand and supply have been equal, and with an unusually steady market prices have not been materially changed. Poorest to best sold as veal calves may be quoted at 6½@10¾c. per lb.; and grassers at $50@12 per head, with very few above $10, and the bulk of the transactions at $9@8.

Sheep and Lambs.—To yesterday, when the receipts were too heavy for the demand, the market was steady and moderately firm at 5½@7c. per lb. for sheep, and 6½@9c. per lb. for lambs; but the latest transactions were at 5½@6¾c. for sheep, and 6½@8¾c. for lambs, and the market closed easier.

Hogs.—The receipts were larger, and the demand has improved. After a fairly steady trade at 5¼@5¾c. for live hogs, and 6¾@7¾c. for dressed, prices during the last two days have been advanced to 5¾@5¾c. for live, and 6¾@7½c. for dressed.

SPECIAL NOTICES.

Factories, Wallingford, Conn. Salesroom, 36 Park Row, New York.

ESTABLISHED 1837.

WEBSTER'S PATENT BUTTON-HOLE WORKER.

The most perfect Button-Hole Worker ever invented

So simple that a child can work a more perfect button-hole with it than the most experienced hand can without it. It does away with pricking the fingers, straining the eyes, and with imperfect and irregularly worked button-holes. They give universal satisfaction. Ladies who use them say that they are worth their weight in gold.

Local and traveling agt's wanted for this and other new and useful articles. Address GEO. DAVIS, 91 Asylum St., Hartford, Conn.

Sample worker, with full directions for use, sent post-paid by mail on receipt of 50 cents.

☞ Please state that you saw this in RURAL NEW-YORKER.

AGENTS TO THE RESCUE!—SCATTER truths among the people. THE PERSONAL HISTORY OF PRESIDENT GRANT, by Richardson, should be read by every American citizen. It is a record of the life of the man, complete and reliable—showing all his virtues and all his faults. Agents can make great wages for the next few months selling this book, as it is much called for and sells rapidly. We give extra commissions on sales. Apply at once for Agencies to AMERICAN PUB. CO., Hartford, Ct.

THE INDIANA AND ILLINOIS CENTRAL Railway Company's FIRST MORTGAGE 7 PER CENT. GOLD BONDS.

$3,500,000.

This is an EAST AND WEST ROAD, RUNNING ON THE 40TH PARALLEL, FROM INDIANAPOLIS, IND., TO DECATUR, ILL., 152 miles; through the richest agricultural and mineral country of both States; and connecting at termini with the GREAT THROUGH ROUTES to the East and West.

It is the only East and West road in a belt averaging 30 miles wide, and passes through the best part of the rich

BLOCK COAL FIELD

of Indiana, in which the COMPANY OWNS 2,000 ACRES OF BLOCK COAL LANDS. It owns, also, 30,000 acres of Farming lands.

$1,400,000 IN CASH HAS BEEN ALREADY EXPENDED ON THIS ROAD, of which 30 miles in Illinois are finished and in operation. Fifty-five miles more, completing the Western Division, Decatur to the Coal Fields, will be completed this Fall, and the whole road in 1873.

Upwards of TWO MILLIONS OF DOLLARS more are pledged to the enterprise, partly by counties, towns and individuals along the line, but chiefly by wealthy capitalists, among whom are W. H. GUION (of WILLIAMS & GUION), SIDNEY DILLON, JAY COOKE & CO., CLARK, DODGE & CO., J. & W. SELIGMAN, VIBBARD, FOOTE & CO., and PAUL S. FORBES of New York, BENJ. E. BATES of Boston, HENRY LEWIS of Philadelphia, and GEO. M. PULLMAN of Chicago.

Bonds $1,000 each, payable in 30 years, principal and interest in *Gold, free of Government Tax.* Sinking Fund 2½ per cent. on Gross Earnings.

For sale at 90 and accrued interest by the Financial Agents of the Company (of whom pamphlets and information may be obtained).

WALKER, ANDREWS & CO.,

New Publications.

ATTENTION, CHOIRS!

THE ANTHEM OFFERING,

By D. F. Hodges, Geo. W. Foster and J. H. Tenney.

230 pages of ENTIRELY NEW Anthems, Sentences, Motets, Chants, &c.

A complete collection for OPENING and CLOSING PUBLIC WORSHIP. The Music is of that practical character and pleasing simplicity, so popular in our Protestant Churches. We believe *every page* of the ANTHEM OFFERING *can be sung*, and will be admired by *nine-tenths* of our Choirs throughout the country.

The ANTHEM OFFERING will be found a first-class book for schools and Societies.

Any chorister or teacher, who will send his address to the Publishers, before Nov. 15, 1872, shall be entitled to a single copy for examination, on such terms as cannot fail to give satisfaction.

Price, $10 per doz. Single copies, $1.

LEE & SHEPARD,
Publishers, Boston, Mass.

IT STILL WAVES. Abused and hated by every SWINDLER in the United States, assailed by quacks and Humbugs, threatened and slandered by the rascals it has exposed, the "STAR SPANGLED BANNER" *still waves.* Its publishers, undoubtedly the *best abused men in America*, return thanks to their 100,000 patrons, and would like every honest man to send 6 cts. and see what that "STAR SPANGLED BANNER" IS. Kuklux are *nowhere.* Over 300 swindlers named, exposed, ventilated. Only 6 cts., or $1 a year. Address
STAR SPANGLED BANNER, Hinsdale, N. H.

THE STANDARD IN THE VAN!

All other Church Music Books, of whatever degree of excellence, are respectfully invited to fall in the rear of

THE STANDARD!

Our NEW COLLECTION OF MUSIC FOR CHOIRS, CONVENTIONS and SINGING SCHOOLS. It cannot be excelled in quality, and intends to lead in circulation.

Some of the Merits.—Short Theory. Abundant Material, Sacred and Secular, for practice. Excellent set of Metrical Tunes, *in large clear print and not crowded;*—a great advantage. Unusually good collection of Anthems, Set Pieces, &c. The compilers, Messrs. L. O. EMERSON of Boston, and H. R. PALMER of Chicago, are perhaps the most skillful men of their time in adapting music to the wants of the "singing" public. *Price*, $1.50. Specimen copies sent, for the present, post-paid, for $1.25.

A Perfect Success! The printers cannot keep pace with the demand! Ditson & Co.'s

Gems of Strauss!

By JOHANN STRAUSS.

It is a large book (of 250 pages, full sheet music size), filled with the best **Strauss Music**, Waltzes, Polkas, Quadrilles, &c., including those performed in this country under the direction of the great composer.

About **$40** worth of music are included in the "Gems," which are, however, sold for the diminutive price of

$2.50 in Boards; **$3** in Cloth. Sent, post-paid, for the retail price.

$500,000 IN BANK.

GRAND GIFT CONCERT.

Postponed to December 7, 1872.

THE SECOND GRAND GIFT CONCERT in aid of the PUBLIC LIBRARY OF KENTUCKY, announced for September 25, has been postponed to **December 7, 1872**, because the accumulation of orders the few days before the drawing made it physically impossible to fill them without a few days' delay, and as a short postponement was inevitable, it was determined to defer it to a time that would make a full drawing sure by the sale of all the tickets.

The money necessary to pay in full all the offered gifts is now upon deposit in the Farmers' and Drovers' Bank, as will be seen by the following certificate of the Cashier:

FARMERS' AND DROVERS' BANK,
LOUISVILLE, KY., Sept. 26, 1872.

This is to certify that there is now on deposit in this bank over half a million of dollars to the credit of the Gift Concert Fund, $500,000 of which is held by this bank as Treasurer of the Public Library of Kentucky to pay off all gifts to be awarded at the drawing.
R. S. VEACH, Cashier.

1,000 Prizes, amounting to

$500,000 IN CASH

will be awarded, the highest prizes being **$100,000, $50,000, $25,000**, and down in regular gradation to **$100**, which is the lowest.

The drawing will positively and unequivocally take place December 7. Agents are peremptorily required to close sales and make returns November 25, in order to give ample time for the final arrangements. Orders for tickets or applications for circulars should be addressed to

Gov. THOS. E. BRAMLETTE,
Agent Public Library of Kentucky,
Louisville, Ky.

N. Y. Office, **609 Broadway**, under charge of **Major Thomas H. Hays.**

RANDALL'S PRACTICAL SHEPHERD: A Complete Treatise on the Breeding, Management and Diseases of Sheep.

THIS Work, by the Hon. HENRY S. RANDALL, LL. D., (author of "Sheep Husbandry in the South," "Fine Wool Sheep Husbandry," &c.) is the Standard Authority on the Subject. It is the most complete and reliable Treatise on American Sheep Husbandry ever published, and (as the New England Farmer says) "should be in the hand and head of every person owning sheep."

The PRACTICAL SHEPHERD contains 452 pages, and is illustrated, printed and bound in superior style. Twenty-seventh Edition now ready. Sent by mail, post-paid, on receipt of price—$2. Address
D. D. T. MOORE, Publisher,
5 Beekman St., New York.

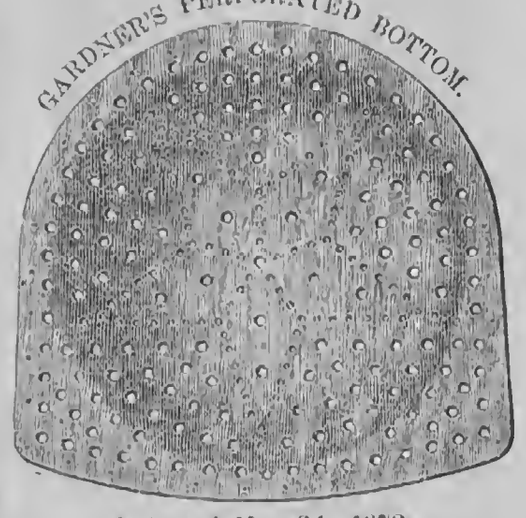
ANDERSON'S AGRICULTURAL STEAMER, for *Steaming* FEED FOR STOCK, Heating Cheese Vats, Tannery Vats, Conservatories, &c. This Steamer is made of Wrought Iron, thoroughly riveted and finished in good style. It has a reliable Automatic or Self-regulating Water Feeder, Safety Valve, Vacuum Valve, Water Gauge Cocks, Whistle, &c., all complete. The boiler is peculiar in construction, being ONE COMPLETE DOUBLE BOILER WITHIN ANOTHER, the two communicating one with the other. It has an extraordinary amount of fire space for the size of the boiler—No. 3, a medium size, having 3,853 square inches of fire surface; consequently, it requires but little fuel to run it. Either wood or coal may be used for fuel.
It will cook more feed, or heat more water, in a given time, than any other Steamer of the same size or cost. It is more durable than any other, for the reason that the fire-box is made of wrought iron, and is *entirely surrounded with water*. We are also manufacturing

Anderson's Low Pressure Steam Heater,

for Heating *Private Dwellings, Stores, Churches, Conservatories, &c.* We manufacture for all the territory east of Illinois.
For further particulars, address
P. P. MAST & CO., Springfield, Ohio.



Patented May 21, 1872.

GREAT IMPROVEMENT IN
CHAIR SEATS.

Various have been the efforts of men to produce a seat which should be comfortable, light, comely, durable, and also admit of universal application. The degrees of success have been as varied as the effort; but within the last year the long-sought was revealed to an observing, practical genius, and is hereby offered to the public, in full confidence of its instant appreciation.
The seat is composed of three layers of veneer (hoards as thin as a knife blade), the grain of each lying in an opposite direction to its neighbor, all glued firmly together in a slightly dishing form, adapted to the person. The entire thickness slightly exceeds one-sixth of an inch. We thus have moderate cost, little weight, neatness, great beauty if desired, and a lasting quality which, in usual service, may properly be called eternal. *While it is especially adapted to reseating chairs by any one who can nail down a carpet*, it is coming rapidly into use for the better class of chairs for sumptuous apartments. The slightest observation will convince the most skeptical of its unequaled merits.

MANUFACTURED BY
The Gardner Manufacturing Co.,
110 Bowery, New York,
MANUFACTURERS OF
Knock-down Book Cases, Looking Glass and Picture Frames, &c., &c.

CONTRACTS TAKEN!

Rights for Sale.

AGENTS WANTED.

"EAGAN'S COMPOSITION."

(Patented March 5, 1867.)

Used in laying streets, roadways, sidewalks, in lining cellars, cisterns, vats, and in the manufacture of sewers and sewer-pipe, water-pipe, drain-pipe, gas-pipe, roofing and architectural ornaments.

STREETS.

Eagan's Improved Macadam pavement for streets is destined to take the place of all other forms of pavement, for the reasons, viz:
It is cheaper, more durable, more easily and perfectly repaired. Is impervious to water, and no atmospheric change will affect it.
It is free from mud and dust, and is noiseless.
It is smooth without being slippery, and has sufficient elasticity to make it the easiest pavement known for animals to travel over.

DURABILITY.

The reason a Macadam road does not last longer is because the stones are loose and rub and grind upon each other—dust and mud is the result. Eagan's Composition holds the rocks firmly together, thus completely remedying this evil, and confining the wear of the road to its surface.

SIDEWALKS.

Eagan's Composition is peculiarly adapted for sidewalks and lawn walks, private roadways, gutters, etc. It can be made into blocks and laid in squares or diamond form, or made one continuous sheet, covering arched work more perfectly than the largest flagstone, and at one-fourth the expense.
Walks made of it have a smooth, hard and even surface, pleasant to walk upon, always clean and free of ice, and of as great durability as if made of the best flagstone. Sidewalks made under Eagan's patent cost but little if any more than if made of plank, and are as durable as rock.

ROOFING,

Made of this composition, is far superior to the common felt roofs that are made of gravel, felt, coal-tar and pitch. The latter is liable to run in warm climates and to crack in cold. By the peculiar chemical combinations in this composition both of these objections are obviated, and a roof produced equal to slate, at a cost of about one-third as much per square.

CELLAR BOTTOMS AND SIDES,

Lined with this composition, from one to two inches thick, keep perfectly dry and warm in winter and cool in summer, and are rat and vermin proof.

FLOORS.

Floors made of it may be painted any color; and are as pleasant to tread upon as if made of wood.

CISTERNS AND VATS.

Eagan's Composition is impervious to water and insoluble in acids, making it just the thing for lining vats in breweries and manufactories of most kinds. It is equally well adapted for cisterns, much better than the best hydraulic cements, and not subject to decay from any cause.

PIPING.

Piping made of Eagan's Composition has been in use for five years in San Francisco, Cal., where it was first invented. It has given entire satisfaction, almost entirely superseding all other kinds of piping for sewers or drains. It is easily and cheaply made, and has the advantage of being made at any place without a great outlay of money for machinery, tools, buildings or materials.
Pipes can be made of any required size, are cheaper, and will sustain a greater external or internal pressure than any other kind of cement pipe.

CEMENT.

As a cement it is acknowledged, by scientific men who have examined it, to be the strongest known. A wall built of brick or stone, and this cement used as a mortar, would be perfectly solid as if made of a solid rock.

SEA WALLS.

Sea walls can be built with this material in combination with broken rock, more rapidly and cheaper than in any other way

DIPLOMAS.

First premiums have been awarded to Eagan's Composition from the following Fairs:
California State Fair, at Sacramento, Cal., 1868.
Mechanics' Institute Fair, San Francisco, 1868.
Sonoma County Fair, at Petaluma, Cal., 1869.
St. Louis Agricultural and Mechanical Fair, at St. Louis, 1869.
New Jersey State Fair, 1870.
It has been exhibited at no other Fairs.

RECOMMENDATIONS.

OFFICE OF UNION RAILROAD COMPANY,
ST. LOUIS, Mo., 23th March, 1871.

This specimen of Pacific Concrete, (Eagan's Patent,) was taken from the Union Street Railroad of St. Louis, Mo., where it has been in use since December, 1869. Since that date the teams of the railroad have passed over that portion of the track where the concrete is used, *300 times each day*, while that same portion of the track is constantly used by other teams and vehicles of the city. This pavement has received no repairs whatever, and shows but little wear after constant use for sixteen months (now 22 months). In summer it is free from dust, and in winter brings with it no inconvenience from snow and ice. The Macadamizing at either end of this block of concrete is renewed three times each year, is soft and wet when much water is used, and in all probability will require such renewing for several years to come before the concrete needs repairing. The block of Pacific Concrete in the track of the Union Railroad has given entire satisfaction. WM. STORR, Sup't.

This Company will take contracts in any city of the United States to make Macadamized Pavements, and will guarantee them to last twenty years, and keep them in repair for a small percentage. Will also supply orders for Drain, Sewer, Water and Gas Pipe. Roofing for sale.

SAM'L N. PIKE, Pres't.
DAVID ALLERTON, Vice-Pres.
W. C. MOORE, Treasurer.
A. WELLES, Secretary.
E. McMURDY, Director.
D. D. T. MOORE, Director.

EASTMAN COLLEGE.

Po'keepsie, N. Y., On-The-Hudson. The only Institution in America devoted to the Specialty of training Young Men and Boys for success in life, teaching them how to get a living, make money and become enterprising, useful citizens. The Oldest, and only Practical Business Training School, and the only one providing positions for Graduates. Refers to patrons in nearly every city and town. Total expense of prescribed course, $100 to $125. No class system, no vacations. Applicants enter any day. Address for particulars and Catalogue of 3,000 Graduates in Business. H. G. EASTMAN, LL. D., Po'keepsie, N. Y.

More than 12,000,000 Square Feet now in Use.

ASBESTOS ROOFING

FIRST PREMIUM (MEDAL) AWARDED IN 1870, AND INDORSED BY CERTIFICATE FROM THE AMERICAN INSTITUTE IN 1871, AS "THE BEST ARTICLE IN THE MARKET."

The **Asbestos Roofing** is adapted for steep or flat roofs, in all climates, and can be easily and cheaply transported and applied.

☞ *Send for Samples, Descriptive Pamphlets, Price Lists, Terms to Dealers, etc.*

Established in 1858. **H. W. JOHNS, 78 William St., New York.**

The Western Trade Supplied by C. L. RICE & CO., Chicago.

The Canada Trade supplied by R. J. SHORT, Montreal.

TARRANT'S SELTZER APERIENT. Trade Mark. Patented.

The Enemy Surrenders.

The dragon slain by St. George, and the snake that stopped the march of Regulus, were mild nuisances compared with CHRONIC INDIGESTION and its accompaniments; yet this foe of health and life, with all the brood of bilious and nervous ailments of which it is the parent, surrenders to

TARRANT'S EFFERVESCENT SELTZER APERIENT,

and is banished from the system. At this season, when the physical powers are so apt to droop and languish, and the spirit to give way, the toning, purifying, refreshing, renovating and regulating operation of this most agreeable of all correctives is especially conducive to a healthful and vigorous condition of the system. Sold by all Druggists.

"FAMILY FAVORITE!"

THE

WEED. WEED.

The most perfect, reliable and generally useful machine in existence. For the family of the farmer or mechanic, where the work required of a sewing machine ranges from the heaviest garments of men's wear to the most delicate and ornamental fabrics for ladies and children, it has proved itself thoroughly efficient and entirely satisfactory. Of unequaled simplicity and compactness of construction, capable of being learned and operated with one-fourth the usual expenditure of time and labor, with a capacity for quantity, quality and variety of execution beyond its competitors, and a reputation for durability and reliability known and appreciated by thousands, it is offered to the people for the most critical inspection and comparison, with confidence that its obvious merits cannot fail to convince the careful examiner of its superiority. Manufactured by the

WEED SEWING MACHINE CO.,

HARTFORD, CONN.

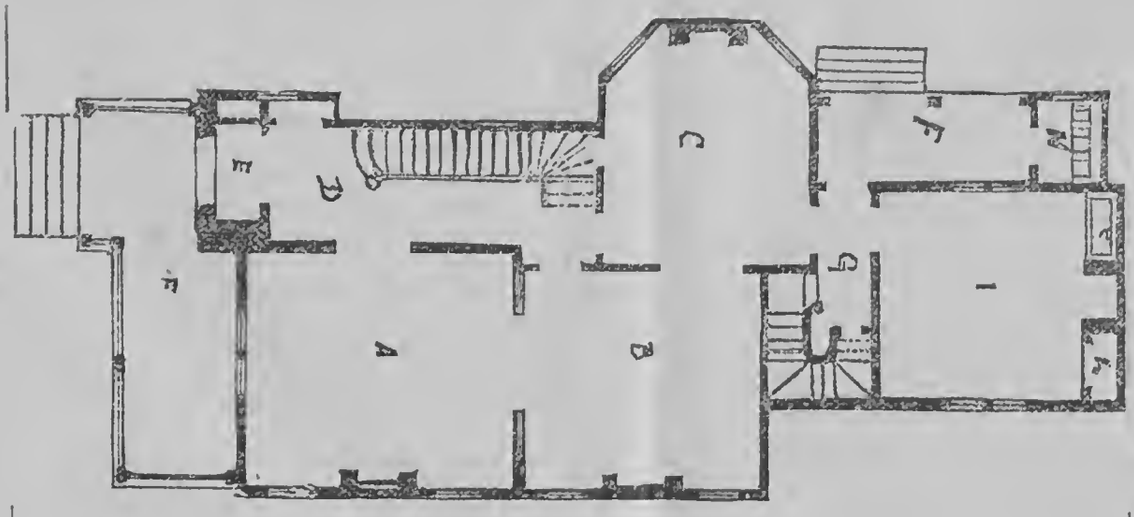
SUBURBAN VILLA.—ELEVATION.

Rural Architecture.

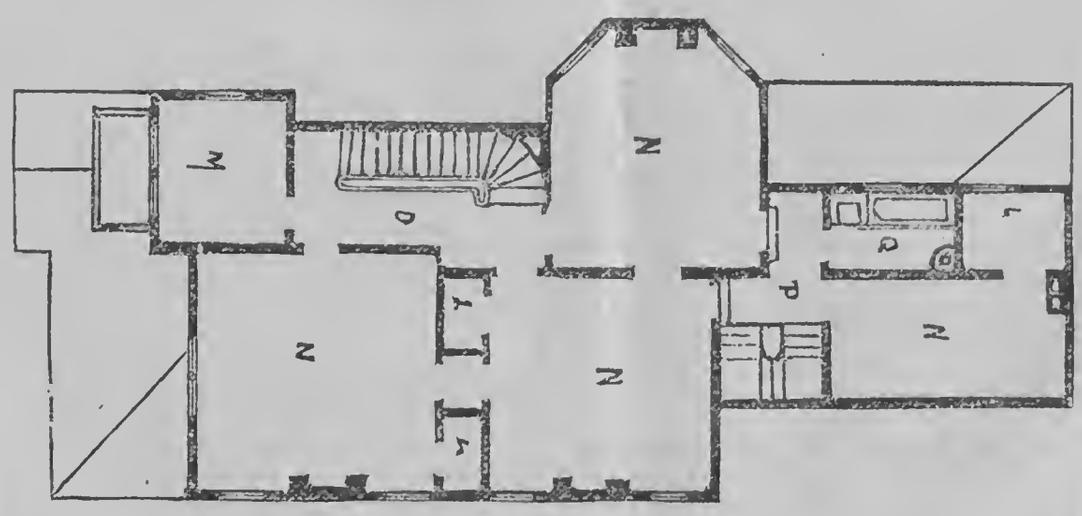
SUBURBAN VILLA.

We have among our readers many city residents, and others whose homes are in or near large towns. We are therefore bound to furnish them matter which will interest them, while it may not meet the needs of the mass of farmers who take the RURAL NEW-YORKER; and we doubtless publish for the farmers much matter that does not interest the class of readers of whom we have spoken above. But our aim is to make the RURAL "generally useful." Hence we give the accompanying elevation and plans of a Villa designed by JAMES H. CARPENTER of this city, who contributes to the Manufacturer and Builder the following description and specifications:

The design of villa published in this number is peculiar in its style and construction, and may be called strictly the French homestead style of architecture. The French roof is genuine in its proportions and form. The rusticated work around the windows and doors, belongs to the homestead style, used in France and England for centuries, and has always been popular. The combination here effected gives grace and beauty which pleases any eye. This building may be built in a city plot, or in the country on elevated land; or in a flat where the background is mountainous, surrounded by lofty trees, it would look loftier than all,



PLAN OF FIRST STORY.



PLAN OF SECOND STORY.

and the taste in ornamentation can be carried to any excess without enhancing its beauty. Having let our fancy describe it, a practical view of the construction will develop the beauties more clearly. The rooms are as follows:

A, parlor, 14 ft. 6 in. x 18 ft.; B, sitting-room, with sliding-doors to parlor and folding-doors to dining room, 12 ft. x 16 ft.; C, dining-room, 14 ft. 6 in. x 16 ft.; D, hall, 7 ft. 6 in. wide; E, vestibule; F, piazza and stoop; G, rear hall and private stairs to second story, and stairs to cellar; H, water-closet; I, kitchen, 15 ft. x 16 ft., with range, boiler, closets, and sink; N, bedroom, averaging 14 ft. 6 in. x 16 ft., with ample closets and dressers—this story has bath-rooms, etc., all complete. The third story is like the second, the octagon room being a billiard room. In the cellar are laundry, milk and store rooms, heater, etc.

The hights of stories:—First story, 11 ft., and second and third stories, 10 ft., all in the clear.

Timbers are as follows in their main particulars:—Posts, 4 x 8 in.; sills, 4 x 12 in.; beams, 2 x 12 in., placed 16 inches from crowns; roof beams, 2 x 8 in.; rafters, 2 x 6 in.; studdings, 2 x 4 and 3 x 4 in., used alternately, and all placed 16 in. from crown. Other timbers are the same as usually employed in houses of ordinary construction. The whole house is sheathed with pine sheathing; it may be rendered warmer by papering also. The clapboarding may be ordinary beveled clapboards, or of any pattern in common vogue. A good, warm clapboarding is effected by using ceiling,

with the shoulder next the tongue on the outside shaved off, and on a bevel to one-half the width of the ceiling used. This style of clapboarding does away with the necessity of sheathing, and makes a warm house.

The trimming of windows should be of 2-inch stuff; also all water-table and belt courses; rebating the upper edge with bevel makes them water-tight. The ornamental scrolls are formed by incising the casings ¼ inch in depth, and filling them with bright vermilion paint. The inside finish is a style invented by the architect, with cut casings finished with incised work and carved ornaments, which correspond with the external finish used, and now used with great satisfaction to the owner in many buildings. There are few moldings used—but very few—and the wood may be polished and finished to great elegance, and also be kept clean without the constant use of the duster, etc., as is common with the enriched molded architraves in common use. The doors, glass and other finish may be as fancy dictates.

The cost of the house complete, with water, heating, gas, bath, and all parts completed, is $7,000; with the addition of hard woods, $500 extra. The difference of locations does not materially alter the cost, as the work is so simple and easy that it is readily comprehended.

LOCATION OF HOUSES

SCIENCE of Health has some sensible suggestions on this topic, which are appropriate here:

Houses should be built on upland ground, with exposure to sunlight on every side. During epidemics, it has been noted by physicians that deaths occur more frequently on the shaded side of the street, than on the sunny side; and in hospitals physicians have testified to the readiness with which diseases have yielded to treatment in sunny rooms, while in shaded rooms they have proved intractable.

Let there be no bogs, no marshes, no stagnant water in the neighborhood. Then let the cellars be thoroughly drained. Inattention to this subject has caused the death of many a person. No father or mother should rest one moment in peace while their innocent babes are sleeping in rooms over damp and moldy cellars. Cellars should not only be drained, but thoroughly ventilated, otherwise the house must be unwholesome.

Let the drains also be constructed for the conduction of slops and sewage of all kinds to a common reservoir, at a distance from the dwelling, to be used for fertilizing purposes.

Door yards should be kept clean and dry, composed largely of green sward, on which children may romp and play. This should be their play ground, rather than the carpeted room. They are entitled to it, that the breath of Nature, and of Nature's God, as it filters down through the blue sky, may fan their rosy cheeks, and fill their souls with joy and their bodies with health.

The Garden.

GARDENERS' NOTES.

Garlic Culture.—I desire to learn how garlic is raised, whether from seed or sets; also how cultivated and prepared for market.—J. E. N., *Princess Anne Co., Va.*

GARLIC is a vegetable but little used in this country, except by foreigners. It is propagated by divisions, or what is technically called sets; these are planted early in Spring, in rows a foot apart, and the sets five or six inches apart in the rows. Any soil that will produce good onions will suit the garlic. During the Summer the soil should be frequently cultivated and kept clear of weeds. The bulbs mature much earlier in the Summer than onions, raised from seed; and, as soon as ripe, they should be gathered and dried. In our Northern markets they are usually sold in small bunches of about fifty bulbs, these being fastened together by braiding the dried tops or fastening with a string. The price is variable and the demand quite limited.

Keeping Onions.—The New England Homestead says:—"Onions will withstand far more cold than is usually supposed. If packed dry in tight barrels, and all interstices filled with chaff, they may be kept in a barn, or where they will freeze quite hard, and not be injured, provided the barrels are closed tight and not opened until the onions are again thawed. Onions stored in a warm cellar are very likely to sprout in Winter, and then decay, emitting anything but an agreeable odor.

Field Crops.

SEEDLING POTATOES.

I WISH to give you my experiments on raising seedling potatoes. From seeds taken from the *Prince Albert* variety last fall, I raised this season eleven varieties, one of which greatly resembles the original. A few of the varieties are of a reddish cast, while the rest are white. The largest of the different varieties, with one exception, weigh from three to four ounces each. One plant was four feet eight inches high and yielded thirty-four potatoes, varying in size from that of a pea to one weighing six ounces. This variety has somewhat of a deep, pink eye, a hardy appearance, and much resembles the variety we here call the *Western Pinkeye*. This seems the most promising, and predicates a very prolific variety; therefore I will at once christen it the *Philippi Prolific*. There are two other very fine varieties that are also very promising. They have a smooth, white skin, with eyes quite full or flush.

This is my first effort in this line, and not being able to compare it with the experiments of any other, I can not say what my success is. I should like to hear of the experiments of others.—JOHN D. PHILIPPI, *Jeff Co., Pa.*

IT IS too soon to determine whether the seedlings will prove of any value, as compared with other well-known varieties, or not. They (the best) should be carefully cultivated, on a variety of soils and situations, three to five years, or until their characteristics—quality, size, hardiness and productiveness—become well established. Then they may be worth talking about. No one knows *now* whether they are or not.

RE-SEEDING OLD PASTURES.

WOULD you advise harrowing an old pasture, say this month (October), and sowing grass seed upon it? Or would you wait until Spring?—P. Y. R.

WERE it a month earlier, you being in a region where deep snows abound, we should recommend seeding this Fall; but there is no gain, that we know of, and some liability to loss, if the seed is sowed thus late. The only gain is that the work is done in the Fall, when there is possibly less pressure. But we should certainly treat run-out and moss-bound pastures to the harrowing, seeding, rolling and a top dressing of fine manure as early as we could get on to it in the Spring—unless it is desirable to turn it under and cultivate it. But there is always a loss in turning under old pastures. There is a loss of variety in the forage grasses it will produce, and which years are often required to replace.

FIELD NOTES AND QUERIES.

Curing Sowed Corn.—G. W. OWENS, Sullivan Co., N. Y., writes the Farmers' Club of New York City:—"The farm I occupy borders the Delaware River, at Narrowside, Sullivan County, and is a sandy loam. I sowed half an acre to corn, in drills, three feet apart, and harvested two tons of well-cured stalks. My mode of curing was to shock immediately after the sickle and let stand from three to four days, then leave open to the sun one day, shocked again at night. This was repeated three times. When the stalks were found to be well cured they were placed under a shed standing, to be fed in Winter. To test their condition, I fed some to working oxen; they seemed to appreciate them as a treat." We believe some of our readers can give a cheaper and better mode of curing sowed corn than the above.

Would we Drill Wheat?—Yes! And we've said so repeatedly in these columns. If the ground is so thoroughly prepared that a drill can be used, our own experience and observation, together with that of all who have used drills, is that it is economical and profitable to drill in wheat. If we are asked which is the best drill, we cannot answer because we don't know. There are dozens of good ones. We prefer one (other things being equal) however, which has rollers following in the drill furrows to press the soil close about the seeds. This answers a half-dozen inquiries so far as we can answer them.

Sowing Spring Wheat and Oats Together.—The Western Farmer has the following:—"The practice of sowing Spring wheat and oats together seems to grow more common. Good reports of the results are given. E. W. Dwight, of Brooklyn, Wis., informs us he has practiced this plan for several years, with satisfactory results. In strong, rich land he mixes the seed in equal parts; in poorer land he uses one part oats to two parts wheat. With good fanning-mills the grains can be thoroughly separated."

Barley and Rye for Winter Forage.—NATHAN W. P. of Pennsylvania is informed that it is too late now to sow either barley or rye with the hope that it will make sufficient growth this Fall to afford Winter forage. It should have been sowed in August or early September. But seeded now it will start early in Spring, and afford early Spring pasturage, or an early Summer soiling crop.

Winter Varieties of Oats in the South.—I have found that if I sow what are known here as Winter oats, in the Fall, I get a far better crop than if I sow the best Spring varieties from the North. I cannot grow good oats here—at least I have not yet—from Northern Seed. I should like others' experience.—A NORTHERNER IN VIRGINIA.

The Horseman.

THE HORSE EPIDEMIC IN CANADA.

THE Toronto Globe, Oct. 10., has the following:—At the present time three-fourths of the horses in this section of the country have been attacked to a greater or less extent. The disease appears to be a catarrhal fever, of an epizootic nature, the result of some atmospheric influence, as is shown by its sudden appearance over a large extent of country, attacking all kinds of horses, old and young, in good condition or in poor. The premonitory symptoms are dullness, a staring coat, a watery discharge from the nose, speedily followed by a severe hacking cough; the pulse is quickened, and the mouth hot; the nasal membranes are injected, and the ears and legs are unnaturally cold; the discharge from the nose increases, and becomes of a greenish-yellow color; the breathing is increased, and in some cases becomes labored and severe. When an affected animal is exposed to vitiating influences of any kind, as impure air, sudden chills, or overwork, the lungs and their coverings become affected, thereby producing alarming and more dangerous symptoms. Although this disease must necessarily prove a great loss and annoyance to the community generally, we do not think it is likely to be of a fatal character, where ordinary care and rational treatment are adopted. We have had an opportunity of seeing hundreds of cases since the outbreak, without any fatal result.

NOTES FOR HORSEMEN.

Horse Stable Floors.—When I first read J. WILKINSON'S article on "Horse Stable Floors" I felt inclined to answer it, but on a second reading of the article the errors appeared so gross and palpable (errors which it is singular that a man of his apparent experience, uninfluenced by a patent, could make), that I gave up the idea. It seemed impertinent to point out the errors to an intelligent man. My best success with horses has been on a floor of pounded earth or coal ashes, kept level and dry by the semi-daily attention of the hostler; and I have never seen a horse so fat that a good, fresh bed did not add to his comfort.—A. R. K., *Charleston, Va.*

To Make Hair Grow Where Calloused.—I cured a valuable horse of lameness from ring bone; but it took the hair off and left a callous. Can I remove the ring and cause the hair to grow?—R. G. W., *Hammondsville, O.*

IN 1869, P. E. W., Denmark, N. Y., wrote the RURAL NEW-YORKER as follows: "I herewith send a receipe which will cause the hair to start right away on bare spots caused by blistering, harness, gall, or otherwise. Take an old boot or shoe, place it on a fire, burn to a coal, pulverize and mix with hog's lard to a thin paste. A few applications of this paste to the bare places will do the work."

Mange on a Horse.—Will some one give me a remedy for mange? I have an animal greatly afflicted.—TURF.

WE have recently seen it asserted that it may always be got rid of by friction with the following mixture:—"Take of whale oil, eight ounces; oil of tar, four ounces; lac sulphur, two ounces; carbolic acid, half an ounce; mix, and apply by means of a hair brush."

To Cure Curb.—I have cured curb on a young horse by giving complete rest. If the animal must be worked, a high-heeled shoe should be used. If there is inflammation, it should be reduced by frequent fomentations and the application of cooling lotions. The enlargement can be reduced by a blister of biniodide of mercury ointment.—YOUNG VET.

Scientific and Useful.

WATER-WITCHING.

I WOULD like to say a word about water-witching, as there are a great many people who believe there is "something in it." In the first place, everybody who has seen a so-called water-witch hunting water, has noticed that he invariably uses a forked stick—usually a branch of some nut bearing tree, or tree the fruit of which has a stone in it. Some are willow; but that makes no difference, so that it be a forked stick. Then they differ in the "reason why" the stick should be drawn to the water. One says it is an affinity between the stick and the water; another that it is a sort of magnetism between the holder and the water which acts through the stick. The fact is, they don't know anything about it.

I propose to tell you just what it is that makes the stick turn down and how any one can find water, as well as any "water-witch." Go to a tree (any kind of wood will do) and cut a nice forked branch that is about one-half an inch thick and forks at an angle of about thirty degrees. Cut it about four inches below the fork and about eighteen inches above on both sides; then you are ready. Grasp the ends of the forks firmly in each hand, holding the single end from you. The hands should be back down, the thumb coming toward the end of the stick; then raise the single end so that the stick stands vertical; then bring down the hands so that they will be horizontal, all the time bending the forks of the stick; now you are all ready to start. Walk steady, holding your stick or wand in front. When you get to the place where you want water spring the forks of the stick, holding one firmly, the other a little loose; press the one ever so little backwards, or towards you, and down comes your wand. "Water!" cries the witch; of course there is water, but the water had nothing to do with the wand; it was all in the spring of your stick. I have seen a stick drawn down in that way when three men had hold at the ends holding all they could; but the stick would turn. It is all humbug! Why don't they carry a straight stick? Because they could carry it until doomsday and not find water with it; and so they would the forked stick if they held it any other way. The fact is, it is all nonsense and ignorance—old fogyism.

I would not write this but I know there are a great many farmers duped by the so-called water-witches, and a great many wells dug just where they are most inconvenient, just because "you will find water" here and not there. The fact is, your chances are just as good where *you* want your well as where the *witch* wants it; it is much cheaper to have a well convenient than inconvenient, and my advice is to dig your well where you want it, and pay no attention to old fogyism and superstition or water-witches that cannot give a "reason why." You can, with a little practice, hold the wand so that it will indicate water every time you want it. Try it, and then show your neighbor how to water-witch.

OLD WATER-WITCH.

Mayton, Washington Co., Kan.

SCIENTIFIC AND USEFUL NOTES.

Numismatics.—When was the first one of our large copper cents made and when the last? I have one made in 1800; but I think that there are older ones. I would like to have you give illustrations of any old coin you may see. I think it would please a great many of your readers.—CHAS. H. WILSON.

WE are not in any sense a numismatician; nor have we any work on American numismatics at hand to consult. If, among our readers, there is any one who can answer our correspondent let them do so. Editors, as a rule, see very little coin; but if we come across any that is rarer (in our hands) than our modern coins, we will give illustrations.

Dairy Husbandry.

DAIRYING IN ST. LAWRENCE COUNTY.

In a recent visit to St. Lawrence county we find that great improvement has been made of late in the manufacture of dairy products. Three years ago we examined some of the leading factories in the county and tested the cheese, besides looking carefully over samples on exhibition, as well as paying a visit to some of the factories in that vicinity. Comparing the present make of cheese with what we saw three years ago, it appeared plain that much attention has of late been given to this department of industry, and that great progress has been made in the management of factories and in the manufacture of dairy products.

Judging from what we saw during our recent visit, we should say that St. Lawrence now stands in the front rank for producing fine goods, or that some of her factories at least are not behind the first-class establishments of the older dairy sections of the State.

At the Gillett Factory, near Gouverneur, we saw a thousand cheeses on the ranges, and a better or more uniform lot it would be difficult to find in any "fancy factory" in the State. This factory takes the milk of 1,300 cows, and during the best season about 2,500 pounds of cheese were made per day. During our visit in September, the yield was about 1,400 pounds of cheese per day; but in St. Lawrence, and especially about Gouverneur, drouth had prevailed and feed was much less luxuriant than in Herkimer and Oneida counties. We regard the Gillett Factory in many respects a model, and should be glad to see the neat surroundings and scrupulous cleanliness of the building more generally followed by our "fancy factories" in other parts of the State.

At the Gillett Factory the floors of the curing rooms were as white and clean as soap and water could make them; not a particle of dust or dirt could be seen in any of these rooms, while the manufacturing department was free of slops, and everything as neat and tidy as the most fastidious housewife could desire. The air throughout the whole establishment was sweet and pure, and this alone was a guarantee to the visitor that nothing short of "gilt-edged cheese" was on the ranges. The factory has a large supply of cool water—this, with the extraordinary cleanliness of the apartments and premises appeared to be the chief characteristics, as the main features of manufacturing the milk do not differ materially from those practiced at other first-class factories.

Since visiting the Gillett Factory we have made inquiry of the shipper who has handled much of the cheese made here, and he informs us that it stands among the very best as to excellence in quality, flavor and uniformity.

Great attention is now being paid to the introduction of thoroughbred stock in St. Lawrence; the preference, so far as we could learn, is for Ayrshires. The pastures of St. Lawrence are well adapted to butter making, and as an indication of the uniform character of the fine butter made in the vicinity of Gouverneur we may refer to the fact that of several samples competing for the first premium at the Fair, the judges (well known experts) were unable to decide which was best, and the premium was divided up among several exhibitors.

WINTER BUTTER MAKING.

Having read an article in the Rural New-Yorker inquiring the best way to make winter butter, I am willing to give some of my experience of twenty-two years: Commence to heat the milk when the cows are first given corn fodder, which I manage in this way:—Strain the milk in tin pans, filling only half full—a little more or less will make no difference; then, as soon as convenient, set the pans of milk on the stove, where let them remain until a roughness or wrinkled appearance on the top of the milk is noticed (if the milk gets too hot the only harm will be less cream), then take it in the milk room or cellar, in a cool place until next morning, when bring it up in a warm room, and let it stand until the next day, when it is generally ready to skim. When treated in this way it will not do to skim much under forty-eight hours. My plan is to skim morning and night's milking both at the same time in winter.

It does not hurt butter for the cream to sour—rather aids in churning, making butter come sooner. The cream kettle I keep in the cellar until the day or evening before I wish to churn; then, if convenient, set near a coal stove or one that fire is kept in all night. In the morning, before churning, try with a thermometer; it should be at the temperature of 62°. If not convenient to set the cream near a warm stove, setting the kettle in hot water will answer every purpose.

Many persons object to heating the milk, because the milk sometimes burns to the bottom of the pans. To avoid this set pans with water on the stove and place the pans with milk in these, and the difficulty is at once avoided.

If butter needs coloring, I would prefer carrot, which is prepared by scraping off the outside and washing; then grate into a small portion of the cream and strain this into the whole. For a churn Spaine's is a good one, with large opening for putting in the cream and taking out the butter; also can take the dashers out, wash and clean more easily.

I would say never wash butter; use as little water about butter as possible. This is my experience, having washed butter to my satisfaction, always having it go strong in a few days after. I have tried many ways to avoid heating milk in winter, but have found nothing as satisfactory as what I have given.—E. P. B., *Eastern Penn'a Farmer's Wife.*

DAIRY NOTES.

The Secret of Good Butter.—Many have been the attempts to account for the superior reputation of Philadelphia butter. Perhaps the most popular notion was that it was due to the prevalence in our pastures and hay-fields of the "sweet vernal grass," which often gives so peculiar a fragrance to meadow hay. But it needed very little reasoning to demolish such a theory as this. This grass is one of the poorest for hay or pasture purposes, and scarcely exists, except on cold clay lands, in partially shady places near groves or low woods. We owe much more of the sweetness of our butter to the abundance of springs and spring-houses in our State, than to anything peculiar which grows in our pastures. Milk has a particular affinity for any odors in the atmosphere, and water has some; hence whatever impurities may get into the atmosphere of the spring-house are drawn out by running water, and the very best security is provided against their being absorbed by the cream.—*Germantown Telegraph.*

How Easily Butter is Spoiled.—A farmer's wife writing to the Ohio Farmer says:—"Of all the products of the farm, butter is most liable to be tainted by noxious odors floating in the atmosphere. Our people laid some veal in the cellar, from which a little blood flowed out, and was neglected until it commenced to smell. The result was, that a jar of butter which I was then packing smelled and tasted like spoiled beef." Another lady reader observes that there is a pond of filthy, stagnant water a few hundred feet from her house, from which an offensive effluvium would be borne on the breeze directly to the milk-room, when the wind was in a certain direction, the result of which was that cream and butter would taste like the disagreeable odor coming from the pond. As soon as the pond was drained we had no more damaged butter.

Chances for Cheese Making in Missouri.—The St. Louis Rural World says, not one-fiftieth part of the cheese consumed in Missouri is made in the State. With the most delightful valleys, and broad prairies, sheltered mountain ranges, we are doing very little towards making the cheese and butter we use. In Texas, Douglass and Howell counties, Mo., there are a great many localities where stock could be very profitably kept throughout the year. Tame grasses grow luxuriantly, and the best of Spring water is abundant the year round.

Bad Milk and Butter in Winter.—It is said when cows are allowed to eat litter which is thrown out of horse stables, impregnated as it is with liquid manure, their milk and butter will be tainted with the taste, in the same way that the flavor is injured by eating turnips, but to a more disagreeable degree. If litter is allowed to be eaten, it should be only given to other cattle, and not to milch cows, which should have nothing but the sweetest and purest food.

Industrial Machinery.

SCOTCH vs. AMERICAN PLOWS.

The Rural New-Yorker has heretofore mentioned a trial of Scotch plows on the Beacon Stock Farm. The New York Farmers' Club had a committee at this trial who have made a report through their Chairman, Col. F. D. Curtis, which was as follows: During the late recess of this Club a committee attended an exhibition of plows and plowing, under the auspices of William Crozier, at Beacon Stock Farm, Northport, Long Island. Beacon Stock Farm is one of the best cultivated estates in America. The fundamental principle which has produced this result is thorough tillage and barnyard manure; hence, with Mr. Crozier a good plow and good plowing are essential auxiliaries, and under his management have been attained. With a characteristic earnestness in whatever he undertakes, it has been a natural consequence for this Scotchman to become an enthusiast on the subject of plows and plowing, and with a love for auld lang syne, and fields admirably adapted for their use, to become equally enthusiastic for Scotch plows and Scotch plowmen. On Beacon Farm no American plow or plowman can expect to excel the implements and workmen Mr. Crozier has gathered around him. He uses nothing but Scotch plows, and they are held by Scotchmen, who can strike a furrow as straight as the arrow flies, and turn a sod so smooth and even that the rule of our early plowing to make each furrow better than the last, cannot be applied, for all are alike perfect. Scotch plows are adapted for large fields and long bouts. In smaller fields with frequent turnings they would be somewhat unhandy on account of the long handles and extended bearings.

For turning green sward your committee are of opinion that we have in this country no superior to the Scotch plow. The draft is light and the implement is handled by the workman with ease. They can be adjusted to turn either a lap or a flat furrow. The furrow is narrower than that of the American plows, and such is the peculiar roll given to it by the convex mold-board that it is seldom broken, but presents a perfect line in thickness and form.

American plows have been constructed for close work; that is, to easily pass over stone, and around stumps and other obstacles. Perhaps the draft and control of the implement have been sacrificed to obtain compactness; and this was undoubtedly necessary in the primitive condition of our fields, but now, when they have become comparatively smooth and free from obstructions, there is no longer any necessity for shortening the handles and beams. Besides, as fencing material is getting scarce our farmers are learning the benefits of larger fields which afford opportunity for longer furrows with less turning and better culture. On the prairies there is space for a full sweep of handles and beam, and here the Scotch plow, or an American plow constructed on the same principle, would be at home. To the soils of New England and the greater part of New York, where the boulders abound, the short gear of the American plow is specially adapted. When thrown out of the ground by one of the hidden stones they return to their work with a promptness which no long-geared implement can do.

The Ames Plow Company were the only parties which responded to the invitation of Mr. Crozier to test their plows alongside of his, and they with commendable zeal and enterprise were on hand with a dozen of their best implements. The field selected for the trial was bounded on one side by Long Island Sound and consisted of a loose, gravelly soil with a tender sward. The Ames plow has a remarkable capacity to hug the ground, which either in a hard or stony soil is a valuable feature. The lap-furrow sod-plow of the Ames Plow Company, while it did not do so good work as the Scotch plow in the hands of Mr. Crozier's experts, nevertheless demonstrated to the satisfaction of your committee that it was an implement equal to any of American manufacture. There were no comparative tests of flat-furrow plows, but the Ames plow on trial performed admirably and received the unqualified commendation of your committee.

The double plow is worthy of particular mention and is able to perform all that is claimed for it: to turn a furrow of sod so that no green can be seen, and at the same time prepare a mellow seed-bed. This plow requires a strong pair of cattle or three horses on account of the depth and width of the furrow—nine to twelve inches deep and fifteen inches wide. So complete is the adjustment of this plow that it ran across the field without any holding. A small plow is attached to the beam, in front, which cuts the sward and turns it into the bottom of the furrow, where it is covered by the furrow of the main plow following.

The stubble plows, steel and iron, put the Scotch plow to a severe test. Your committee have no hesitation in saying that these plows, for plowing stubble without a coulter, did the best work and are a perfect implement. They are light and strong and will plow a great depth. In this latter respect they are so much easier handled and do the work in such a satisfactory manner that for stubble plowing we would specially recommend them. They also have a green-sward attachment, which makes them a combined plow, and as a plow for all purposes we recommend them. The side-hill or swivel plows put to test worked well; one of them has an elongated or standard moldboard which presses against the furrow after it is turned over and is a new feature in plowing. This takes the place to a considerable extent of the harrow, thereby saving time, and in light sod would prepare the soil for seed without the necessity of a harrow, as it causes sufficient disintegration and pulverization. The stubble plow rolls up the soil in such a loose, pliable manner that the surface is fitted at once for a perfect seed-bed.

HOME-MADE WIND-MILL.

J. Corwin of New Jersey says:—"Farmers and others can, in many cases, construct a wind-mill themselves for a tithe of the cost of the patented plans, that, for certain purposes, would suit them better, because easily kept in repair. Here is the suggestion of a plan for which it may be said that it can be constructed (for churning, stock pumping, etc.) for five dollars, beside the material that the farmer can find on his farm and his own labor, excepting also the sails, which properly belong to the manufacturer. Of course, to obtain such a result, the simplest possible plan must be devised, and all 'improvements' rigidly ruled out. It consists of an upright post supporting an upright shaft, having a hub on top carrying three horizontal arms, to each of which are hinged light rectangular frames covered with heavy muslin or light canvas, regulated to swing in one direction only, from horizontal to perpendicular. The sails are carried with the wind, at right angles to it, and return edgeways against the wind. The post may lean two feet at the top, so as to shorten the connection of the upper box with it. The lower bearing may be in a post set in even with the ground, under the upper bearing. The pulley, four feet in diameter, secured near the bottom of the shaft, may have a smooth, true groove for rope band burnt into its circumference by a 'stone' bar, its one end resting in a hole in the post, the other in the hand, the section in contact with the wheel being red hot. A mill on this plan can, at moderate cost, be constructed for milling."

The Australian Harvester is the name of a machine that is making a sensation among California farmers. Four to six horses are used to run it; these with two men are force sufficient (it is claimed) to cut, thresh and sack, cleaned and ready for market, one acre of grain per hour. It is reported compactly and strongly built, saves half the expense of harvesting, and threshes and cleans equal to the best threshers. It has neither reel nor sickle-bar; its operation is simple, and its draft less than in machines where these are used, and its threshing cylinder is fed with a regularity, it is said, impossible for manual labor to work it.

Rice-Huller Invented.—Sept. 28 we published an extract from the Mobile Register asserting the need of a Rice-Huller, and that a fortune awaited the successful inventor of one. Now The South of this city announces that Col. G. H. Peabody, Columbus, Ga., has invented a successful machine, and only awaits the enlistment of sufficient capital in the enterprise to put it into the hands of rice producers. The South says it "works charmingly," and "there is no doubt about its being a success."

Headers are condemned by some Californian farmers, because it is believed the wheat is injured by cutting the heads off, thereby preventing the flow of the sap into the grain, and rendering it necessary the latter should be fully ripe before cutting.

The Naturalist.

OUR FUR-BEARING ANIMALS—IV.

1—AMERICAN RED FOX.

(Vulpes fulvus.—AUDUBON.)

THE red fox is found in all the Northern parts of the United States and in Canada. The length of the body is thirty inches; that of the tail seventeen. This animal is formed for lightness and speed, and is more perfect in its proportions than any other species of this genus. Its eyes are near together; its legs long and slender; its tail very bushy; hair on the whole body, soft, silky and lustrous; the toes are so clothed with hairs as to conceal the nails; the body has a strong, musky smell. AUDUBON says in addition to the distinct varieties of this species, the black and cross fox, there is difference in the color of the red variety; the common color he gives as follows: "Point of nose, outer extremity of ears, and outer surfaces of legs below the knees, black; forehead, neck, flank and back, bright-reddish and a little deeper tint on the back and fore shoulders; around the nostrils, margins of the upper jaw and chin, pure white; throat, breast, and a narrow space on the under surface, dingy white; extreme end of bush, tipped with white." The hair on the body is of two sorts—long hairs, interspersed among a dense coat of softer, brighter, and more yellowish fur; on the tail the longer hairs are more numerous, and many are quite black, giving the tail a dusky appearance.

Foxes live chiefly in burrows of their own digging, but sometimes ejecting the maker and owner, they use the residence of the woodchuck. These burrows, usually extending under ledges of rock or roots of trees, have two or three openings. Though sometimes seen in the daytime, the fox usually goes abroad at night, prowling through woods and fields, and sometimes among out-buildings in search of booty; this consists of rats, rabbits, and other small quadrupeds, eggs, and various kinds of insects. He catches birds, both by lying in wait for them and by trailing them up in the manner of a pointer dog. He feeds on beechnuts when they are plenty, and some say upon many kinds of berries. The young are produced in early Spring, from four to six in a litter. They do not leave the den for six weeks or more.

Probably there are few country boys in New England, who have not tried to entrap this wily animal, having obtained from some old trapper the formula for an infallible "scent," or, working on some nice plan of their own invention, only to discover at the cost of some time, labor and disappointment, that the proverbial cunning of the fox is no myth. The methods of trapping foxes, successfully, are secrets known to comparatively few, and by them carefully guarded, round prices being demanded by the possessors for initiation into the mysteries of the art; so that we could not, if we would, give directions for trapping them; and as, in those parts of the country where they are hunted for sport, we consider trapping them the meanest kind of poaching, of little profit to the trapper and ruining the sport of the hunter, we would not if we could.

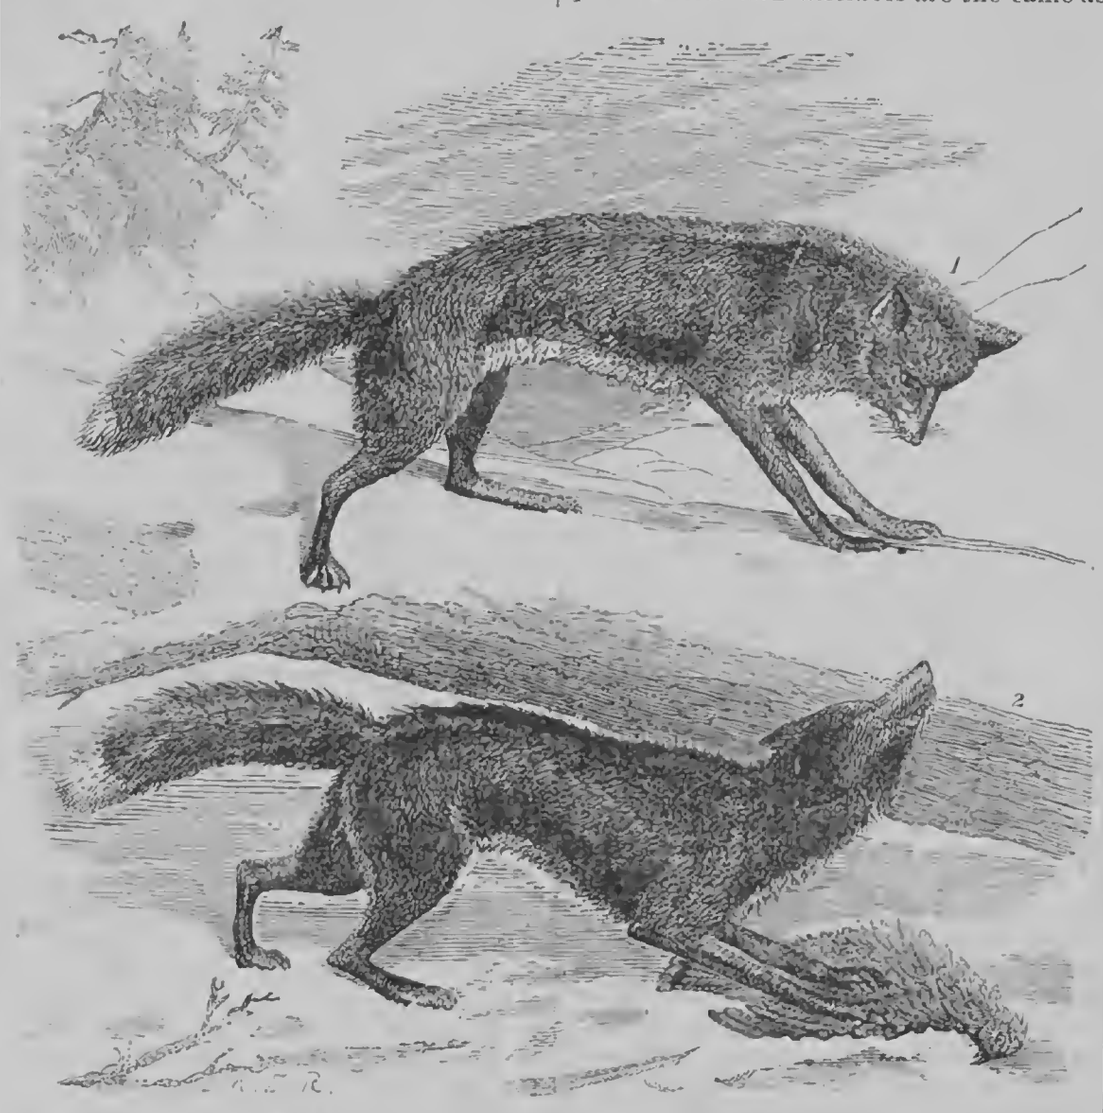
Hunting the fox in the English style, on horseback with hounds, is, from the nature of the country, out of the question in the Northern States; for no horse could by any possibility follow the course of the hounds and fox, for an hour, in the mountainous parts of New England, the chase often leading up the face of precipices which the most active hounds can only achieve by dint of the hardest and slowest climbing, and through thick and tangled forest and swamps, in which horse and rider would be hopelessly mired. Here, the hunter goes on foot and carries a gun, his object being to shoot the fox. The endurance of the man and his knowledge of the many wiles of his game, aided by the staunchness and scenting qualities of his hounds, are pitted against the cunning and endurance of the fox; and a right noble and manly sport it is, old-country sporting rules and prjudices to the contrary notwithstanding; nobler and manlier, in every way, than shooting the silly hare before hounds, or the murder of deer, driven by dogs to water, then overhauled in boats and clubbed to death, both "legitimate sport" according to the rules and practices of genuine sportsmen," as is the stealing upon and slaughter of yarded moose.

The likeliest places to find the trail of the fox are in partially cleared fields, lying adjacent to woodland, where he has been mousing in the early mowing. Taking it here, the hounds will work out the somewhat cold scent to where he has taken to the woods, or, perhaps, has settled himself for a nap on some sun-warmed stump or knoll in the open. A wild burst of canine music announces that the game is a-foot, and the hunter gets with all speed to the nearest spot promising a shot. When pursued by hounds too swift of foot, the fox is forced to flee to the fastnesses of the mountains, or betake himself to his burrow, either way spoiling all sport, unless by skill or chance he is waylaid in his retreat. But if not too hard pressed he will run in circles, sometimes a mile or more in diameter, sometimes in lesser ones, and often for a while confining his course to an acre or two. Many times during his course he will resort to the tricks, to put the hounds at fault, for which he is so famous, such as running in sheep paths and through flocks of sheep, across newly-plowed fields, on the top rails of fences, and picking his way over rocks—wiles which call forth the utmost powers of scent and sense in the best dogs, and which utterly baffle the hound of second-rate qualities. In his wider courses, at some point the fox will almost always run so nearly in the same path that if the hunter can find that point he will be rewarded by a shot, which, perhaps, he gets within the first half-hour of his waiting, perhaps in the course of the day, or, fortune not favoring, not at all; but it will be strange, indeed, if once, or more than once, he does not feel the rapture of delightful expectation of a shot—the next best thing to getting one.

In many parts of the country there is nothing left worth hunting but the fox, who is so admirably fitted to take care of himself that he will maintain a foothold long after other game is exterminated, if he have but half a chance for his life. And in neighborhoods where he is frequently hunted by hounds he seldom does any mischief among poultry or lambs; but he does make great havoc among the meadow mice, and is thought by many to more than make amends to the farmer, in this way, for any injury he may do the sheepfold or poultry-yard.

To skin the fox, rip, inside the legs, from one hind foot to the other; skin the legs and tail as directed in a former article; then haul the skin off, whole, over the fore legs and head. It should be stretched, wrong side out, on a board the proper size and shape, being careful to stretch it to the utmost.

Most fox-skins are exported to Russia, where they are greatly used by the middle classes. Until recently, if they were used in this country, they were so metamorphosed by dyeing as not to be recognizable by the original wearer; but the visit of the Grand Duke turned fashionable heads foxward. The prices of fox skins range from one dollar to three.



1.—AMERICAN RED FOX. 2.—THE SILVER FOX.

2—THE SILVER FOX.

(Vulpes fulvus.—VAR. ARGENTATUS.)

THIS fox is found, though nowhere in abundance, in the colder regions of this continent. Those found in the far Northwest are the finest. It is rarely found on mountains in the Eastern and Middle States, though silver-gray foxes are often reported as having been seen here, yet when killed they usually prove to be dark specimens of the cross fox. Its sizes, habits, peculiarities and instincts are the same as the red fox of which it is a variety. The body is covered with two kinds of fur. The long hairs extend two inches beyond the under fur, and are especially long on the neck, throat, shoulders, flanks and tail; it is soft, fine and glossy; the under fur is long and dense, exceedingly fine and soft; it surrounds the whole body, even to the tail, on which it is coarser and more like wool. When viewed separately the hairs have a wavy appearance. The soles of the feet are so thickly clothed with woolly hair that no callous spots are visible. The under fur is blackish-brown; the long hairs are brown at the root, then silver-gray, tipped with black; hairs on the neck and along the back, black; whole under surface, brownish-black; upper parts, glossy, silvery-black; tail, brownish-black, broadly and always tipped with white.

This beautiful fox supplies one of the most valuable furs in the world. Owing to its richness, beauty and variety the skins are always in demand, and will bring from fifty to one hundred dollars, or more. It is said the skin of this fox was considered by the native Indians of New England equivalent to forty beaver skins; and when offered and accepted by their kings it was looked upon as a sacred pledge of reconciliation.

R.

The Vineyard.

FREAK IN A VINEYARD.

IN gathering grapes to-day we found one of the clusters, in shape, a *perfect tomato*. It is of quite large size, and on the outside is divided into eight segments or lobes, having a seed to correspond with each segment or lobe. It was found on a cluster of one of Rogers' Hybrids, and a peculiarity is, that the grape is *blue*, while this is *red*. The flesh and seeds and all else is a perfect grape. President WILDER'S trophy tomato stands about three rods from the vine.

I call upon President WILDER to explain with what sort of propagating qualities he has invested his trophy tomato, to know, if we continue the cultivation of that fruit, whether our apples, plums, cherries, etc., will or will not turn into trophy tomatoes. I have saved the eight seeds for a further solution of the problem.

If President WILDER declines an explanation for *fear of the consequences*, I call upon all the Horticulturists of America to commence at once an investigation, and I will furnish them with the *hide*, which I have carefully preserved as conclusive testimony against him. R. L. DORR.

Dansville, Liv. Co., N. Y., Oct. 6, '72.

WE did not know that President WILDER was in any way responsible for any of the qualities the trophy tomato may possess.

Pomological.

POMOLOGICAL GOSSIP.

Newtown Pippin.—At the Farmers' Club, recently, Dr. HOWSLEY of Kansas asked if there are really two varieties of Newtown Pippin, as is so often stated by the books. The books state that there are two—the yellow and green. Dr. H. had grown this fruit since 1837, on various soils and under various circumstances. The green (so-called) pippin was always yellow when ripe. In Kansas they have to top work or graft it in order to succeed with it. Mr. FULLER said that WM. R. PRINCE used to insist upon making cuttings from and propagating from different trees; but with the exception that the bark of one was rough and the other smooth, I could see no difference in the characteristics of the trees from which Green and Yellow Newtown Pippins were respectively propagated. Dr. HOWSLEY said he had never been able to find any one who could tell him just where the Green Newtown Pippin originated, but has had no difficulty in tracing the history of the Yellow one. Mr. FULLER says he believes the Green Newtown Pippin to have originated in some nurseryman's catalogue.

Keeping Apples in Maryland.—GEO. W. FOREMAN, Mechanicstown, Md., asks if it injures apples to freeze, and wants to know how he can keep his apples during the Winter. His crop being large, he doubts if he can keep them from freezing. He can keep his apples without any difficulty, probably, and much easier than he supposes. The essentials to keep apples well is to keep them *dry and as cool as possible without freezing*; but they will endure a greater degree of cold without freezing than most people suppose. A Jersey correspondent kept a large quantity of apples through the Winter of 1870-'71 by piling them up in a dry place on the ground and covering them with salt hay. We have kept apples well by selecting a dry place in the field, and when there became danger of freezing, pile up the fruit as one would potatoes. Cover with straw and then with dirt sufficient to protect from frost. The Winter varieties may be kept till the first of April, safely, in this way, if one has no cellar room.

Apple List for N. Louisiana and S. W. Mississippi.—JAMES PARKER, Summit, Miss., gives the following "list of such choice varieties as long and careful experience enables me [him] to conscientiously vouch for." We find it in Rural Alabamian:—Red Astrachan ripens last of May and June 10; Sweet Bough ripens June to July 20; Garretrou's Early ripens July 25; Primate ripens last of July; Duchess of Oldenburg; Rhodes' Orange ripens last of July; Bruce's Summer ripens last of July; Robinson's Superb ripens last of July; Sugar Loaf, late Summer and early Autumn apple. Bradford's Best ripens in August; Belle de Havre, a September apple, sometimes ripening in July; Taunton; Eloxkee. Of later varieties he names as among the best Hockett's Sweet, Southern Winter, Yates, Stevenson's Winter, Shockley, Residence, Southern Limbertwig, Carter.

The Snyder Blackberry.—A correspondent of the Prairie Farmer highly commends this new variety for its productiveness and hardiness. In his particular locality, at Normal, Ill., it succeeded much better than the Kittatinny. The same result may not occur again, or in different places. But the variety is worthy of further attention. It is described in the transactions of the Illinois Horticultural Society as very productive, and as partaking of the character of the Rochelle and Kittatinny, and as hardy as the latter.

Plums Rot on Trees, ususually, because they have been stung by insects. This answers G. F. FORDHAM.

The Yorkshire Beauty Apple is attracting British attention as a fine large early culinary apple, a great bearer and tree perfectly hardy, of a good upright habit; ripens the end of August. It may be that it is worth importing.

Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

What the Mails Bring me.—*Oct. 7.*—The mails bring me some curious things. Sometimes the contents of packages received are very valuable, at least I appreciate them highly, although others might consider them mere trash; and it is well that we do not all think alike or follow each other in the same track. One package received to-day contained a horned toad (*Phrynosoma regale*, GIRARD), the Tarantula of Texas (*Mygale Hentzii*), and a number of small beetles; among the latter I found several species which I value highly, inasmuch as they are new to my cabinet, while the toads and spiders were not. In another package from Missouri I found a specimen of that very scarce insect, the Stag-beetle, (*Lucanus elaphus*, FABR.) The horns or jaws of the male give it a most formidable appearance, although it is harmless, and is not injurious to vegetation, as its larva lives in old rotten logs. Although this beetle is quite a rare one, there are others closely allied, which have not as yet appeared in many entomological cabinets. Among the latter I may mention the *Sinodendron rugosum*, MANN, which is found in Oregon, from whence the mail has just brought me a pair. The male has quite a long horn projecting from the top of his head, somewhat after the style of that of a Rhinoceros. In another package from the same State I found a number of specimens of two species of the *Omus*, another very rare beetle. A few years since the Pacific coast was a far-off land to the naturalist; but the railroad, and consequent increased facilities for carrying the mails, brings those distant regions so near that we can exchange the products of the Atlantic coast for those of the Pacific without any apparent loss of time. The insects, plants and minerals found from California to Alaska are becoming as familiar to us as those of our older States.

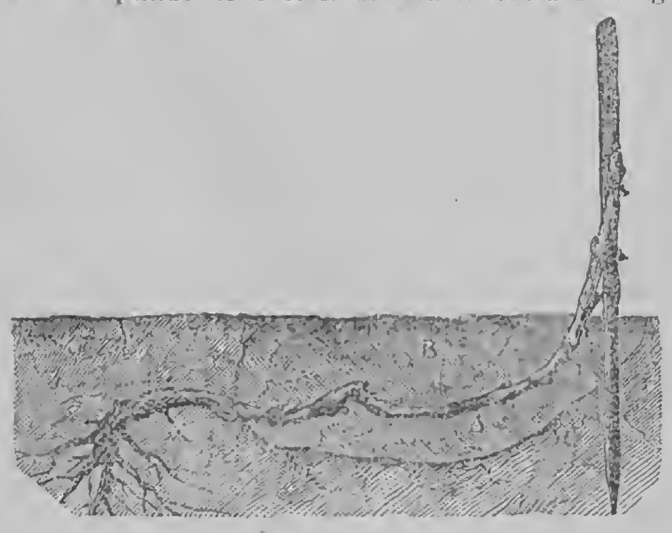
CUTTING-GRAFTING.

Acorns Sprouting.—*Oct. 8.*—The white and black Oak acorns that fell from the trees two or three weeks since have already commenced to grow, and in many, examined to-day, I found the root (radicle) had penetrated the earth two inches, and could not be pulled up without breaking off a portion of the lower end. Here is a lesson for those who wish to raise Oak seedlings; sow as soon as the acorns fall from the tree, in shallow trenches, and not cover more than a half inch deep until cool weather; then add a little more earth. The acorns as they fall under the trees are exposed until the leaves fall, then they are well protected. Acorns are like many other seeds of forest trees; and if once they become thoroughly dried their vitality is gone, and no amount of soaking or freezing will make them grow.

Strawberries in Autumn.—*Oct. 9.*—I have two beds of Bush Alpine strawberries—one of the Red and the other White. They were planted in good, rich soil, and given good culture; and from the first of June until the present time there has not been a day on which I could not have picked a dish of really handsome and delicious fruit from these plants. Of course the berries would not compare with the larger sorts in size; still they are strawberries, and very good ones, too. I have thoroughly tested the fancy Alpine sorts, such as Autumnal Galande, Jams and Mexican Everbearing, but the two sorts known as Bush Alpine, suit me best. The plants form large stools and produce no runners, consequently are less troublesome to cultivate, and I think produce far more abundantly. They require rich soil and plenty of water, and then one can obtain fruit continuously throughout the Summer and Autumn. I should think these sorts would be valuable in Colorado, California and other localities where irrigation is practiced extensively. The plants are the hardiest of all the known species, and there would be little danger of winter-killing in the coldest regions of the Rocky Mountains. In propagating these Bush Alpines the old stools are pulled to pieces, and each little offset is planted separately, these soon forming large clumps.

The First Frost.—*Oct. 11.*—Last night we had our first frost, and this morning the garden looks desolate enough. The immense leaves of my hundreds of *Caladiums* and *Cannas* have withered and lie dead upon the ground. *Dahlias*, *Coleuses*, *Geraniums* and the various bedding plants have lost their glorious colors, and all are now a faded, useless mass, only fit to go into the compost heap.

The glory of Summer and Summer flowers has departed and now Autumn reigns supreme. Now comes the busy time for gardeners and those who have good flower gardens; for the tender bulbs and tubers must be taken up, dried and stored away for Winter. Last year we had a severe frost on the 21st of September; therefore we consider ourselves highly favored this season, and I have been ready for a cold snap since the first of the month, consequently had everything secured that would be likely to suffer. I have never been caught napping when I attended to my plants myself; but when I trusted to a foreman, as I did last year, scores of choice things usually got frosted. My green-house is already gay with flowers. *Bouvardias*, *Geraniums*, *Heliotropes* and *Roses* are in full bloom, and I have only to pass from the chill air outside into one under glass redolent with the fragrance of flowers. Here I shall pass the greater part of the coming Winter, being my own foreman and gardener. It is a good many years since I have managed a green-house myself; but I think the old love for tender plants will, in a measure, bring back a portion of my old skill in their cultivation. If the roses mildew, and lice and other vermin destroy the tender plants, then I will confess that my hands have lost their cunning. I expect to have a good time all by myself, among the flowers and various insects which I intend to breed this winter. Blocks of wood full of the larvæ and pupæ of beetles have already been collected; cocoons and chrysalids of butterflies and moths are being collected for next Winter's campaign under glass. By the way, I wonder if our entomologists know that a good conservatory, heated with hot water or steam, is one of the best places imaginable to rear insects? It is far ahead of any office breeding-case, besides being a delightful place to conduct experiments. It is passing strange that so few of our florists take any interest in entomology, considering the opportunities they enjoy for study and investigation. If every insect could be sold for a half dime, they would no doubt take hold of it with a will; and I am not quite sure but some of them would sell their heads as well as their souls for cash; but this is their business and the consequences would be theirs and not mine.



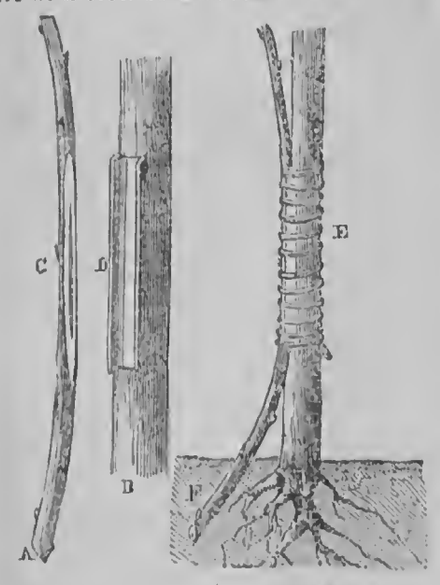
LAYER-GRAFTING.

Arboricultural.

CUTTING-GRAFTING.

THE ordinary modes of grafting have been fully illustrated in the RURAL NEW-YORKER. From a series of articles on the Art of Grafting, being published in an English journal, The Garden, we copy the following on cutting-grafting which will be novel to many of our readers, though generally well known to professional horticulturists:

In order to propagate various kinds of trees or shrubs, which succeed as cuttings, and not so well when grafted in the ordinary way, we have recourse to a mixed process, the base of which is the employment of a cion or a stock in the condition

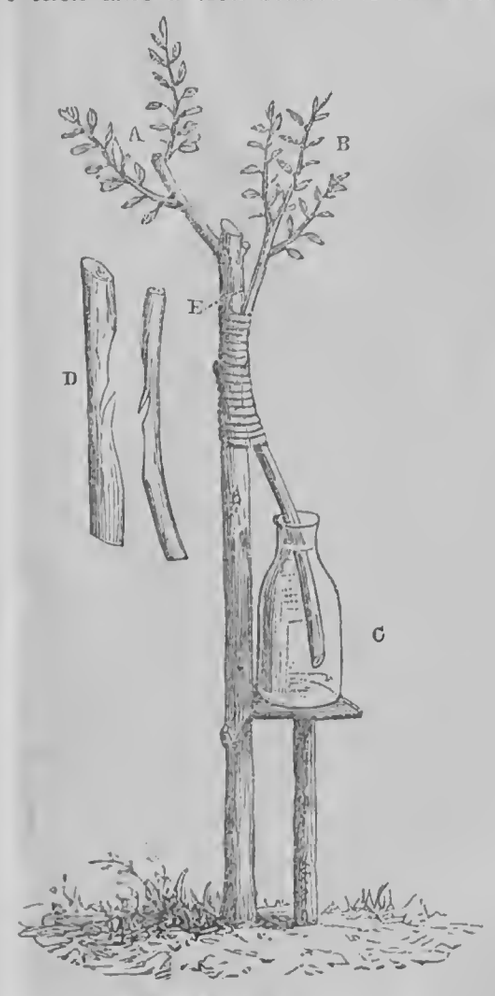


LAYER-GRAFTING (ANOTHER METHOD).

of a cutting. The new roots which spring from the cutting strengthen the graft by supplying it with additional vital elements. It is, so to speak, half grafting by approach, and often a case of root-grafting. Sometimes the cion is the cutting, and sometimes the stock, and occasionally both are cuttings united by grafting. Adepts in grafting, they say, should succeed in grafting a cion of orange tree on the midrib of a leaf of a citron tree which has been newly slipped!

Grafting with the Cion a Cutting.—In this method the cion only is a cutting—the stock is a tree which has been at least a year planted. It may be left entire or headed down at the time of grafting, and may be grafted either close to the ground or at some distance from it, under the surface of the soil, or above it.

Cutting-Grafting on a Low Stem.—There are two principal methods based on the previous amputation of the stem or otherwise. Here the stock is shortened to within four or eight inches from the neck. We then take a cion branch of sufficient



CUTTING-GRAFTING ON A TALL STOCK.

length, that when its extremity is buried in the soil as a cutting, close to the stock, it may be grafted on the stock, and have a couple of buds above the graft. The stock is channeled with the gauge, and the bark is removed from that part of the cion which is to be placed in the groove. They are then bandaged and covered with mastic. When a vine is grafted in this way, the soil is heaped up about it so as to cover the graft. When the stem of the vine is young, or if it is furnished with vigorous shoots at the base, we have recourse to *layer grafting*. A small trench or hole is made at B, in which the shoot is to be layered; the shoot to be grafted is then cut down to the third eye, as at A. The other shoots of the same stock are removed, or cut short, or grafted in the same way. The cion is grafted at A in the English fashion, then cut so as to leave two or three eyes overground, and fastened to a stake. Should the stock offer any resistance, it can be pegged down in the bottom of the trench with a forked stick; the hole or trench B should then be filled with good, free soil, which will facilitate the production of the new roots.

Instead of previously shortening the stock, it may be grafted entire, so that it may not be mutilated to no purpose, should the graft miss. The cion A is cut as at C; the stock B is prepared to receive it by making three incisions in, and raising the bark, as at D. The two parts are then brought together, as at E, in the same way as in grafting by approach; the cion having its base, F, buried, in order to form roots, or merely for the purpose of keeping it alive. The graft is bandaged, and covered with mastic or grafting wax. When the operation is performed in Spring, the upper part of the stock is to be gradually removed in the course of the same year. We begin to do this in a week after grafting, by cutting away some of the branches, and repeat the operation at intervals during the Summer, in proportion as we see the shoots of the graft develop themselves. The process is finally completed by the removal of the stump in the following year. If the separation of the lower part of the cion from the ground can be dispensed with, its chances of a lengthened existence will be doubled. If it is necessary, however, it is best accomplished gradually, by successive annular incisions, which will, by degrees, accustom it to draw its sustenance entirely from the stock.

Cutting-Grafting on a Tall Stock.—If the cion is not long enough to be at the same time planted as a cutting and grafted at a certain hight on the stock, we make good the deficiency by using a vessel filled with earth, or a bottle of water raised to the required hight, and receiving the lower part of the cion. Cool sand is much better for this purpose than vegetable mold, as it is not so liable to become dry. Should the grafting take place during the period of vegetation, while the sap is flowing, we should prefer using a vessel of water, C, at the bottom of which should be a layer of powdered charcoal, in order to prevent the decomposition of the water, which otherwise must be renewed frequently. The cion, B, should be stripped of its leaves; in the case of deciduous subjects these should be cut off close to the stalk; in evergreens it will be sufficient to cut the half of each leaf away. The graft, which is made either by veneering, or in the English fashion, should be covered with grafting-clay, and shaded with paper. The removal of the upper part of the stock, which is began in Summer by gradually cutting away the branches, A, and the top of the main stem, should not be completed (as at E) until after the growth of the year following. At the same time the heel of the cion should be cut away level at its junction with the stock, the office of the auxiliary sand or water having now ended.—*C. Ballet.*

"WHAT I KNOW OF FALL PLANTING."

LAST fall I purchased 130 apple trees. I had read so many accounts in favor of Fall planting that I was induced to plant some 90, and 40 I heeled until in Spring. The land had been cultivated with potatoes—the first crop taken off the land; was twice plowed and was in fine condition. I planted 90 trees, and in the Spring counted 26 that made a start; now there is not one healthy tree among them. The bark is yellow and knotty. The other 40 I planted in the Spring on newly broken sod; all lived but two. Some of my neighbors bought trees at the same time and place and planted in the Fall with the same success. My neighbors condemned the trees as being too small and deficient in roots. The trees were very poor; most of the roots were left in the nursery grounds. I also planted 113 more apples and pears that I purchased of a Geneva firm, and only lost one. These last have grown from 6 to 13 inches this summer. If you should think proper to print this and save some poor man's trees, my experience will not be in vain.

MISSION OF THE AGRICULTURAL PRESS.

ABSTRACT of an address delivered before the Ohio Agricultural Convention, by Col. S. D. HARRIS, of MOORE'S RURAL NEW-YORKER.

IN nearly a quarter of a century's intimate connection with the Press, and close familiarity with the agricultural literature of the age, I have witnessed the rise, propagation and success or failure of a host of theories, facts, fancies and schemes, some of which have borne goodly fruit for the sustenance of the people, others of which have been nipped by the frosts which take such green and unwholesome things, as they should always do, but sometimes do not. And thus I have often found myself walking in a grave-yard of agricultural literature, amid the tombs of buried fancies or the carcasses of such as pollute the air for want of burial.

This is the experience of every agricultural editor who has been long time enough in the harness to have observed these facts, or who has been a diligent reader of what has been put upon record.

The agricultural periodical press is the most potent and active agency of our day, in the dissemination of this sort of useful knowledge among men. The living sympathy between the editor and his readers, gives a fresh zest to every issue of the paper, and the publication of a widely various correspondence, enlists the co-operation of a greatly varied style of thought and expression, subjecting the whole to the closest criticism and to be viewed from all sides, according to the knowledge or fancy of different people.

The agricultural paper comes at such intervals of time, and in such convenient quantity and variety, that it receives immediate attention; its contents are all taken in at a few sittings, and the intellectual man is thereby fed and groomed, to go upon the race-course of his duty, and lay out his strength to the best advantage.

The mission of the press is two-fold—first, to build up; and, second, to break down—to build up that which is good and true, and break down that which is bad and false; and the editor should be thoroughly furnished for both of these styles of labor.

[After discussing both these propositions in detail, the speaker proceeded to run a parallel between the influence of agricultural papers and various other agencies for the collection and dissemination of useful knowledge. Coming at last to the subject of agricultural colleges, he said]:

It seemed like a very liberal thing that the Government should have made provision for the endowment of institutions of learning, in which agriculture and the mechanic arts should receive prominent attention. Now let us suppose, for the sake of argument, that this endowment had been bestowed in the support of a good agricultural paper in each State—not to make it a gift concern, like the government seed store at Washington, but rendering such assistance as to place it above the necessity of depending upon advertising patronage for its revenues. The editors and contributors could be suitably paid for their services and the best talent of the world could be enlisted for the diffusion of the best information at their command. Allow for this paper, in Ohio for instance, the modest estimate of fifty thousand copies weekly for the four hundred thousand rural families of the State; allow only four readers to each family, thus supplied with the paper, and you have an aggregate of two hundred thousand readers! This paper goes to that number of readers every week in the year, full freighted with intelligence upon all the varied interests of their occupation; and there at their own firesides, under all the domestic and social influences of home and society they drink in of that fountain and grow up into that knowledge, at small cost, less inconvenience and no separation. Who shall estimate the difference in result between such a far-reaching and inexpensive agency as this and that of the agricultural college upon its one or two hundred students under the most favorable auspices? Two hundred against two hundred thousand! The larger number educated *on the farm*, amid all the binding influences of HOME, and in the daily practice of its health-giving and instructive labors; the smaller number, sent away from home, to be educated *off from the farm*, and most likely to stay off thereafter; their domestic habits broken up, their systematic rounds of industry laid aside—entering into new associations and filled with new ambitions, not the most conducive to a love of farm life or industrial economy.

I leave you to strike a balance between the extent, cost and result of these two agencies for a practical education of the industrial classes.

Do you ask me if I would desire or advise such an endowment of the agricultural press? I answer,—No. It is contrary to the genius of the American mind, and the spirit of American institutions—which teach personal independence and self-reliance as the cardinal doctrines of the Republic. In the prosecution of their business the conductors of the press have laid a foundation which is safer and better than to depend upon the patronage of the State. [After speaking of the great numbers of people who are reached by the periodical press, the speaker concluded his address as follows:]

To-day I stand in the Capitol of Ohio, speaking to an audience of two or three hundred people; what I may write to-morrow, of the transactions of this Convention and of other matters, will go out upon the manifold leaves of the press, to the homes of *half a million of people*, from the Atlantic to the Pacific, across the ocean to the kingdoms of the old world, and to the far-off islands of the sea!

If I have seemed to magnify the reach and mission of the press, and to assign it a place above others, I have also shown by facts and figures that we have justly earned that high position by the energy and intelligence with which we have pushed our conquests into the highways and by-ways of the earth, and sent the gospel of labor as an evangel of peace, to greet the people at their own homes, and to throw around them the bonds of a common fraternity and to endow them with the franchises of a noble independence.

In the pursuit of this, our chosen occupation, we ask for no endowments or special legislation from the State, but only a fair and open field in which to sow our seed and reap our harvests, amid the competitive businesses of the world.

"EMPLOYERS AND EMPLOYEES."

I WOULD reply through the RURAL NEW-YORKER to "Reform," of Johnstown, Fulton Co., N. Y., in the matter of treatment of hired help. In a former article "Reform" stated how the hired help of that County were oppressed by employers. I was much surprised, but did not discredit his statement. I informed him where better things existed; and as his heart bled for the poor, and as he had ample means and time, I suggested that he inform the suffering ones where better things prevailed. I referred him to Livingston County. But "Reform" discredits my statement, and says he has seen much of the world and knows it is the same throughout the land. Much seeing nor many years will make no one wise without the power to discriminate.

If "Reform" should utter such an appeal in Livingston Co., for its working men, as for the half-paid, half-starved of Fulton Co., they would reply, "dry the moisture about your dewy eyes, old boy; if we can't take care of our interests in that direction, we deserve to go under."

I have but little reverence for that court at Johnstown which decided that a young man could not support a wife with an income of $20 per month; a less heavier court would have known that there are those who cannot support a wife with an income of one thousand dollars per month; and that tens of thousands of others have and are supporting not only a wife, but a family also, on less than the first mentioned sum. With regard to myself, I have a wife and family and am not an uncommon man—weak in body but strong in the purpose to live, if possible, outside of charity. I commenced in this town, working for farmers by the day. My pay did not amount to twenty dollars per month—but fifty to seventy-five cents per day for all work except harvest; that was $1.25 to $1.50 per day; this was the extreme of my wages for years—as long as I worked for others.

To-day, and for several years, farmers have paid $1.30 in Winter, $2 for Spring work and from $2 to $3 for haying and harvest, and $2 for all Fall work.

In twenty-five years, wages have more than doubled in Livingston Co. Has the poor man's cost of living doubled? Not necessarily, by a large balance. Will not "Reform" place these facts (or will he continue to disbelieve) before the suffering poor of Fulton Co., and prove in deed, and not in words alone, that he desires to relieve their distress; for Livingston Co. can employ and feed hundreds more.

EVERY-DAY LABORER.

Caledonia, Livingston Co., N. Y.

Land Department.

FROM SOUTHEAST MISSOURI.

I HAVE traveled quite extensively both South and West, at different times, and while I acknowledge each State has many desirable and charming situations, the surrounding circumstances forbid a poor man of even hoping to ever settle there and secure the farm he covets. While the soil on the prairies is all that could be desired in richness and fertility, the water is very scarce and poor, the winds very annoying, and severe in the Winter, and the settler continually in trouble about wood and building timber. Here, in Southeast Missouri, I find the usual varieties of soil found along rivers, streams, and uplands, with excellent timber of various kinds, and abundance of water. The latitude is such as to guarantee mild and short Winters, being some eighty miles South of St. Louis, and between thirty-seven and thirty-eight degrees North. Although there have been white settlers in this county for seventy years, and the soil and general features of the country the most inviting to the farmer and stock grower, yet the population at this time is less than ten thousand, and a very large per cent. of this number is in and about the various mines of iron, copper, lead and zinc, with ores among the richest in the world. St. Louis having been the great central point of all westward travel, and no public conveyance to this part of the State, is why Eastern men have never found it out. While many travelers have passed through the Northern and Central parts of Missouri, and the public prints have been filled with long and interesting letters from those sections, Southeast Missouri has had no one to speak for her, and hence the fairest and most desirable part of the whole State is comparatively without inhabitants.

Those who settled here in an early day were so well pleased with the make of the country that they all secured large bodies of land, expecting that the time would speedily come when the county would be thickly settled, and their lands very valuable. But these settlers were from the wrong side of Mason and Dixon's line, and of course never advertised for settlers to come and buy their lands, or even described them, and the tide of emigration passed North. This part of the State is yet to be brought into notice, and, I hope, to be settled by Northeastern families.

The old settlers have nearly all gone to their several resting places; each one finding it out in his field or fence corner, along the orchard; showing a spirit of aristocratic independence and selfishness, even after death. These secluded and private burying places are generally overgrown with weeds and bushes, and are constantly springing up (or appearing) before the landviewer, as it were, like ghosts in a thicket, and, soon, the ideas associated with such places become stereotyped, and are classed with heathen customs and relics of barbarism.

Slave labor having made homes and support for them in other years, then suddenly leaving them, they have found out that modern democracy, bad whisky and bushwhacking (Ku-Klux) would not plant and gather crops equal to slaves; and hence nearly all the land in Southern Missouri is for sale—all wanting to "leave this old and worn-out country and go to Texas." That is the Mecca of the "Piker's" brightest dreams. Four-fifths of South Missouri are yet in the woods; few new farms are being opened up by the "natives," and the first that was cleared has been declared "worn out," and left to grow over with briers and bushes; while other portions in the same field (or enclosure) that have been under the plow for twenty, thirty and forty years, producing as many crops, have never had a load of manure, or any other artificial fertilizer applied. And yet, strange to say, fair average crops of corn, oats, barley and wheat are yearly harvested from these very fields. Their wheat is generally grown after corn, and nearly every boy and man that I have seen plowing had but one horse or mule to a shovel plow, and went twice between the rows, *i. e.* two furrows, and then the seed was put on and a limb of a tree or bush dragged over it and left.

I think these native Missourians are to be classed with the sorriest and shabbiest farmers out of Mexico. They step in the old footprints, and follow up the agricultural examples set by their worthy ancestors, abominate clover and all other methods of fertilizing the tenacious and faithful soil, and seem to expect a paying crop annually for all time to come.

A few men from Ohio have recently settled in this section, and, under their improved method of culture, old, worn-out fields have again responded with beautiful harvests, and are now seeded to clover and timothy of the finest growth and appearance. It is a fine fruit-growing country, I am told, and, judging from the great abundance of apples and peaches that I have seen all along my line of travel, it is all they claim for it in that line. The varieties of fruit grown East are not seen here, as little attention has ever been given to fruit. Grapes of several different kinds have here and there been planted, and are doing remarkably well.

I am of the opinion that if a goodly number of Eastern men would come out here and settle, the farms under their management would double in price and value every third year. I mean the "*old, worn-out land*" and the uncleared land. There is great need of more land being cultivated, as the county does not produce near enough to supply her own citizens. A great deal has to be shipped every year from St. Louis to the miners and citizens of the various villages throughout these mining counties, and hence the home markets here are better than at St. Louis.

I have no land to sell, and only speak of the country as it appears to me. Have been here since last July, and have traveled over this and St. Genevieve County "rite smartly."

N. A. T.

Farmington, St. Francois Co., S. E. Mo.

The Poultry Yard.

FECUNDITY OF DUCKS AND HENS.

THE English people are noted for raising ducks, and they often make interesting experiments. One was lately made to test the relative fecundity between ducks and hens, and to determine which of the two would produce the larger number of eggs in a given time. For the purpose three hens and three ducks were selected, all hatched in February, and nourished with suitable food. In the following Autumn the ducks had laid 225 eggs, while the hens in this case had laid none. In the following February the laying began again with the ducks, and continued uninterruptedly till August. They showed no inclination to set, and became very thin, but subsequently fattened up somewhat. In the mean time the hens had not been idle. The total number laid by the hens amounted to 257, or 86 eggs each; and the ducks produced 392, or 131 each. Although the eggs of the ducks were rather smaller than those of the hens, yet they proved to be decidedly superior in nutritive material.

POULTRY NOTES AND QUERIES.

To Prevent Hens Eating Their Eggs.—Last Winter I had great trouble with my hens. They would eat their eggs. It was not because they were not fed lime, meat, etc., and plenty of it. Is there any way of stopping them doing this thing?—R. P. S., *Wilmington, Del.*

THERE is one way we have seen recommended. Make a laying-box with a false bottom, forming an inclined plain, down which the egg rolls, as soon as laid, into a receptacle beneath, thus placing the egg out of the reach of the hen at once. Just how this is made we cannot say, but we fancy any Yankee can make one; and since our correspondent is a Yankee, his eggs are safe.

Commendation of the Rural.—I find your paper a very useful one. I had about sixty good hens, and about one week ago several were dying every day; but upon going to the RURAL NEW-YORKER I found a recipe which has cured them, by giving only a few doses.—MRS. E. VERMILYA.

WE are sorry Mrs. V. did not state what troubled her chickens, and what recipe she used. We should be glad if, whenever our readers find anything or recipe recommended in the RURAL, of value, they would give the details. It will help others as well as themselves, if they do so.

Lumps on Chickens' Feet.—WM. H SNOW (see RURAL NEW-YORKER Sept. 28, p. 201) is informed that the lumps on chickens' feet are caused by chickens jumping from the high roosts with a hard thump. These lumps often make the chickens very lame. Therefore the way for Mr. SNOW to do is to have lower roosts, or a rack for them to walk down on instead of jumping down.—D. T. R., *Pittsburg, Pa.*

The Literary World.

NEW PUBLICATIONS.

Travels in South Africa.—Compiled and arranged by BAYARD TAYLOR. New York: Scribner, Armstrong & Co.

THIS is another one of those beautiful $1.50 volumes of the illustrated library of travel, exploration, and adventure. It tells the story of such missionaries and travelers as MOFFAT, LIVINGSTONE, ANDERSON and MAGYAR. The greater part of the book is very properly devoted to the travels and discoveries of Dr. LIVINGSTONE. A postscript is added containing the latest news brought by STANLEY, and his route is marked on the map. The book is well illustrated and intensely interesting.

The Marble Prophesy, and Other Poems.—By J. G. HOLLAND. New York: Scribner, Armstrong & Co.

DR. HOLLAND has a wide circle of admirers, to whom all of his books are welcome. This new poem is in his usual vein. We do not like the severe manner in which it pitches into a religious sect, but perhaps this is to be expected from a Puritan author. The poem is finely descriptive, and so short all will finish it who commence to read it. The remainder of the volume is composed of poems familiar to the public, some of which are surprisingly sweet and tender.

The Pennsylvania Pilgrim.—By JOHN G. WHITTIER. Boston: James R. Osgood & Co.

OUR best lyric poet has given us in this new poem one of his best efforts. He sings the song of those early Germans who were the first to come to America, settling near Germantown. They were also the first to move for the freedom of the slave. The poem is full of beauties and will give the reader fresh delight. A dozen shorter poems compose the miscellaneous part of the volume. The book is finely illustrated, and sells for $1.50.

Round About Rambles in Lands of Fact and Fancy.—By FRANK R. STOCKTON. New York: Scribner, Armstrong & Co.

A BOOK unusually handsome and attractive, full of superb pictures. Some seventy different subjects of interest to the young are discussed in a lively manner, illustrated by one hundred and ninety beautiful pictures. The book deals largely with animal life, and has many curious anecdotes. It makes a volume of nearly four hundred pages, and is just the thing for a gift-book.

Dream of a Free Trade Paradise.—By CYRUS ELDER. With Twelve Illustrations of HENRY L. STEPHENS. Philadelphia: H. C. Baird.

THIS work is inscribed to Gen. GRANT, "the friend of the workingman" and the "next President of the United States." The pamphlet is very readable, and explains away many things in relation to the teachings of the free-traders, which all American citizens should know. It sells for 30 cents.

Nast's Illustrated Almanac.—New York: Harper & Brothers, 1873.

A HANDSOME 25 cent pamphlet of 50 pages, full of NAST'S quaint illustrations. The work is very funny, and has articles by ELI PERKINS, MARK TWAIN, JOSH BILLINGS, CHARLES DICKENS and GEORGE P. WEBSTER. It is well worth the price asked, and will be popular.

Song Life, for Sunday Schools, Etc.—By PHILIP PHILLIPS. New York: Harper & Brothers.

AN illustrated Sunday school music book, superior in every respect to most of its class. The reputation of the author, as well as the excellence of the book, will insure a large demand.

The Young Dochinor.—By CHARLES NORTHEND, A. M. New York: A. S. Barnes & Co.

FOR 75 cents parents can place in the hands of their children this beautiful little collection of pieces in poetry, prose and dialogue, which is admirably adapted for their use.

The Lives of Grant and Wilson.—T. B. Peterson & Brothers, Philadelphia.

A HANDSOME book, containing the facts in the lives of these men. It sells in cloth for $1. It contains 400 pages and has a number of engravings.

An Appeal to the Good Sense of the Voters of the United States.—Who shall be President? New York Publishing Company.

A SMALL, poorly-written pamphlet by a Virginia woman, who urges the election of Gen. GRANT.

Howard's Recitations.—New York: Dick & Fitzgerald.

A NEAT little volume of 100 pages, filled with a choice collection of prose and poetical articles—comic, serious and pathetic.

"EXCELSIOR!"

The Rural's Programme of Premiums for 1873.

A $5 PICTURE, FREE,

TO EVERY YEARLY SUBSCRIBER AT ONLY $2.50,

AND

LIBERAL PREMIUMS TO CLUB AGENTS!

THE RURAL NEW-YORKER'S hosts of Friends, all over the Continent, will please note the following announcement of UNPRECEDENTED PREMIUMS for both Subscribers and Club Agents:

Observe, firstly, that we give every Yearly Subscriber who pays $2.50 a Splendid STEEL-PLATE ENGRAVING, (size 24 by 30 inches,) entitled "BIRTH-DAY MORNING, or *The Gardener's Present.*" This is a most Beautiful and Pleasing Picture—a Gem of Art fit to adorn any Home, in Town or Country. The original plate cost *Several Thousand Dollars*, and each copy of the Engraving is worth $5. Note that this *Grand Premium* is sent to every person paying $2.50 for the RURAL one year—so that each subscriber at that price really gets $7.50 for only $2.50!

Note, secondly, the annexed list of VERY LIBERAL PREMIUMS offered those who form Clubs for 1873, or for one year from any date. See the Names and Prices of Articles, and the small number of Subscribers required to secure a Valuable Premium. Almost any one located in a locality where live, reading people reside, can, by a little timely effort, secure a Premium worth from $5 to $200. *Now is the Best Time to Start Clubs*, for as soon as election is over everybody will want such a good, useful and popular paper as MOORE'S RURAL.

Remember, thirdly, that every article we offer as a Premium is *First-Class and Genuine*—that we put each at lowest retail price, and that the names of manufacturers or dealers (given in most cases) is a guarantee of good quality, etc. Note, also, that all Club Subscribers—whether at $2 for the paper only, or $2.50 for Paper and Engraving—can be counted by Agents for Premiums.

The Table below specifies the Cash Price of each article offered as a Premium, and the number of subscribers required to secure it at $2, (our lowest club rate)—or at $2.50 with our Premium Engraving. Note that the Premiums are offered *without any condition as to whether the clubs are composed of new or old subscribers.* Canada subscribers must add 20 cents per yearly copy for postage.

SPECIFIC PREMIUMS,

TERMS, &c., FOR MOORE'S RURAL NEW-YORKER FOR 1873.

OPEN TO EVERYBODY.

☞ No advertisement inserted for less than $3.

SATURDAY, OCT. 26, 1872.

ELECTION-DAY DUTIES.

1. Let every voter go to the polls.

2. Let him go early.

3. Let him go to the polls with a RURAL NEW-YORKER in his pocket.

4. Let him vote as his judgment and conscience dictates.

5. Let him give his neighbor any advice about voting he may desire for his country's good.

6. After both he and his neighbor have voted, let him show his neighbor the RURAL NEW-YORKER and ask him to subscribe for it, telling him how sweet a solace it will be to him and his family, after the wrangling and turmoil of a political campaign, to be able to read a paper which will afford instruction and pleasure, devoted as it is to Progressive Agriculture in all its departments, to the Elevation of the Family and to the enhancement of the Pleasures of Rural Home Life.

7. Let him forward the money thus received promptly, giving full name and post-office address of each subscriber, and receive the premium we offer for such work and the satisfaction of knowing that he has not only done his duty as a Citizen, but as a Friend and Neighbor.

WHAT ARE THE PROFITS?

THE harvest is nearly ended. There is some corn to husk, potatoes to dig, roots to gather, apples to pick, butter and cheese to market, etc., etc. But the farmer who has carefully kept account with the different departments of the farm can approximately estimate his profits for the year. What are they? We do not ask this question because we desire it answered to ourselves, but that each farmer may answer it to himself. And if he finds out there are profits, we hope he can put his finger on his ledger and tell just what crops did, and what did not, yield him his net revenues.

This course we deem absolutely essential to intelligent, economical, and progressive husbandry. If the blind leads the blind they both fall in the ditch. If a man's corn crop has cost him $1 per bushel, and is worth in market but 75 cents—that is, if he can buy corn for 75 cents per bushel, equally good, the fodder he gets from the crop grown will scarcely fill out the margin of difference; and then, if he blindly goes on raising corn, year after year, with no knowledge of what it costs him, it will require the profits he may derive from some other crop to counterbalance his loss on corn. But if he knows what the corn costs him, and whence the profits he gets are derived, it will be an easy matter, comparatively, to stop the leaks and increase the profits the succeeding year.

Have the profits been derived from economy, or from liberality of expenditure in relation to especial crops? In other words, is there any one crop which returned $2 for every $1 expended in producing it; and if the expense of culture or for plant food per acre had been increased, would the profits have correspondingly increased? Or has the farmer found the maximum of expense per acre it pays to give to any one crop? These are interesting and profitable questions for him to answer.

The losses of effort and time on a farm are very much greater than most men realize. The loss of time perhaps is greater, notwithstanding the fact that farmers work so many hours per day. This loss is not due to the fact that the time is not all or nearly all occupied, but to the other fact that it is too often improperly directed, is not economized and hence is wasted. But if the time absolutely spent in the production, harvesting and marketing of a crop is charged to that crop, the husbandman soon discovers its value, how much it enters into the cost, and will devise ways and means to economize it—that is, to expend less time in producing the same results. The trouble is, that in making up accounts with crops too many farmers *estimate* the amount of time consumed in their production, instead of charging each crop, daily, with the time actually expended upon it.

The result of such inquiry as we have suggested above will be to cause a higher value to be placed upon time, to see that it is not wasted and, therefore, a better direction of the effort or force expended in producing crops. The best ways and means will be devised and adopted for doing the most work in the least time and at the least expense; for every thoughtful farmer knows that just in proportion as he diminishes the cost of production he enhances his profits.

AGRICULTURE AND CIVILIZATION.

ADOLPHUS OTT read a paper at the last meeting of the Liberal Club upon "The Relation of Agriculture to Civilization," which was little more than a compilation from old books, to prove that the decline of civilization had followed the decline in agriculture—the exhaustion of the soil. But this was not clearly proved to be the cause of the decline in civilization. There was a good deal of learned talk about fertilizers, soil exhaustion, political economy—a melange of facts and theories which had little relation to the topic of the evening.

The relations of Agriculture to Civilization seem to us very simple—much like the relations of fuel and water to a steam engine. The engine cannot move without the fuel and water; nor can the fuel and water propel a machine that is not created and adapted to such propulsion. Agriculture feeds civilization; but there would be no agriculture without civilization; and it reflects rather than determines the condition of civilization. A high civilization involves progressive agriculture; but that agriculture is anterior to civilization is not true. It is the effect, not the cause. It is the supply a demand has created. Because New York does not produce as much wheat per acre as she did twenty years ago, it does not follow that the civilization of its people has deteriorated. On the contrary, a decline in agriculture rather follows than anticipates a decline in the civilization of the people. If, however, agriculture in any district does decline, it does not necessarily follow that civilization has declined. For there are many instances where people of a district have abandoned agriculture for commercial and professional pursuits, yet in no sense retrograding from enlightenment and culture, while their fields have been left to ignorant laborers and their farms permitted to go to ruin.

The practical good of such a paper is not plain; nor did the discussion which followed betray any ability on the part of the speakers, with one or two exceptions, to take a broad view of the needs of the agriculturists of this country, and of the means of supplying those needs that are adapted to conditions that exist and cannot be changed at will. It is not always wise to be contented with asserting what should be; it is better to make the most of what is. If American agriculture is not to-day what it may be, it is simply because capital, labor and intelligence are wanting to make it so—in other words, civilization is not far enough advanced here to secure the results that may, with altered conditions and increased needs, become absolutely necessary, and which, when necessary, will be sure to be realized.

RURAL NOTES AND QUERIES

American Exhibitors at the Vienna International Exposition.—A good deal of effort is making to secure a full representation of American industry and American resources at Vienna, Austria, next year. It is asserted by Commissioner Van Buren that the grounds and buildings to be occupied by the exhibition are six times as large as those at Paris in 1867. In a recent speech he said that no Government appropriation had yet been made by the United States, but he believed that at the next session of Congress such an appropriation would be made, and if duplicate receipts for expenses were kept, he believed that the appropriation would refund money expended before the action of Congress. Austria was more anxious that American products should be well represented than those of any other country should be. The speaker then showed a side elevation of the principal building to be used, and a ground plan of the buildings already erected, and of the grounds. The chief building is 3,000 feet long by 82 feet wide, and has a number of transepts 350 by 50 in extent, so that the entire surface covered by the building will be 1,500,000 feet. The dome of the building is the largest in the world. There would be a separate building for power machinery, 2,600 by 150 in extent. There would also be a large building for agricultural instruments exclusively.

Something in the Shape of a Wheat Field.—Let our Eastern readers try to form some conception of the way wheat is grown in California, from the following statement gathered from the San Francisco Bulletin. There is a wheat field in the San Joaquin Valley which covers 36,000 acres! The crop this year is reputed to average 40 bushels per acre, or 1,440,000 bushels in all, which would require over forty ships of medium size to transport it to market. One side of this "lot" is 17 miles long. When plowed, ten four-horse teams were attached to ten gang plows, each gang having four plows. Lunch was served at a midway station, and supper at the terminus, 17 miles from the place of starting. The grain was cut by twenty of the largest reapers. There are two other wheat fields in this valley, one of which contains 23,000 acres and the other 17,000. Then, as an offset to this magnificent statement, we have this:—"There are thousands of tons of wheat which cannot be taken out of the valley this season, and must remain over, a dead capital, or, what is nearly as undesirable, will only command advances at heavy rates of interest." And then, to show the wheat growers of the Western States the importance of providing for the consumption at home of their product, by encouraging home manufactures and diversifying industry, thus rendering themselves independent of foreign markets, we print a statement of the same paper, dated Sept. 20, that since June 28, sixty-three vessels have left that port for England loaded with wheat. Of this number, 15 cleared in July, 32 in August, and 15 more in September to date. Before the first one reaches Liverpool, nearly, or quite, 100 vessels will be on the way, with their prows pointing to the same port, and carrying 125,000 tons of wheat. It adds that, with sufficient tonnage, such a fleet can be maintained for six months.

Imports and Exports.—From the last report of the Bureau of statistics we learn that the imports to this country for the month ending April 30, 1872, were $73,865,485; for the corresponding month 1871, $50,712,200. For the ten months ending April 30, 1872, the imports were $521,201,459; for the corresponding period the year previous, $434,743,688. The domestic exports during the ten months ending April 30, 1872, were $409,471,561; foreign exports, $18,724,027; for the corresponding period of the year previous, domestic exports amounted to $423,829,619, and foreign exports to $24,164,779. Thus it will be seen that during the ten months ending April 30, 1872, the imports in excess of the domestic and foreign exports amounted to $93,005,871, or about 22 per cent; while for the corresponding period of the year previous our exports exceeded imports to the amount of $13,250,710, or about 3 per cent. The value of the foreign commodities remaining in warehouse April 30, 1872, was $90,958,406, as compared with $55,881,202, April 30, 1871.

How to Sell a Milch Cow.—The following story is told as having occurred:—A Mr. WHITCHER, Whitfield, N. H., wanted a milch cow, and bought what appeared to be a good one in a neighboring market, after a number of persons who claimed to be interested in the purchase and sale had seen twelve quarts of rich milk taken from her. The day after Mr. WHITCHER came in possession, his dairymaid undertook to get some milk from the same cow and she wouldn't "give down a drop;" and it was soon discovered that the animal had no appearance whatever of having milk. It is believed, by those who know the circumstances, that a false udder had been used in the milking scene, which was quietly slipped off before the cow was delivered to the purchaser.

Advising Where to Go.—We often have inquiries like this:—"I want to know to what part of the United States you recommend me to go. I want to go to some warm climate. My means are limited. I am a single man and don't mind hard work, as I want to get a home for myself." We have no advice to give in response to such an inquiry except this:—There is not a State in the Union which has a warm climate, that has not some advantages over some other State; and any young man able and willing to work, who is frugal, can make himself a home in any of them. Don't ask for advice, but go and begin the work of securing a home at once.

Illinois Stock Law in Force.—Oct. 1, went into operation, in Illinois, a law which provides that it shall be unlawful for the owners of any domestic animal of the species of horse, mule, ass, cattle, sheep, goat or hog to permit them to run at large after the 1st day of October, 1872. For a violation of this law a penalty of not less than $3 nor more than $10 shall be imposed, the money to be paid to the school fund of the township.

The Horse Disease in Canada, a Toronto dispatch, dated Oct. 18, says, has now extended throughout the Dominion, seriously interrupting the business of the country. The street cars in Montreal have stopped running; in the city railway stables more than 300 horses are sick. The farmers in the country are unable to bring grain to market. The disease is not often fatal, but recovery is slow.

P. S.—We also learn that this disease is prevailing among the horses of Buffalo and Rochester, N. Y.; also in several towns in Rutland Co., Vermont.

"The Best Paper and the Best Premiums!" is the pledge and practice of the RURAL NEW-YORKER. Our design is to make the paper far better next year than now, and it will be observed by reference to list on preceding page that both Subscribers and Agents are to receive more Liberal Premiums than ever before. The Pioneer RURAL leads the van in intrinsic merit of contents and liberality to its friends.

"A Rare Opportunity" is the heading of an advertisement in this paper offering a very desirable Virginia farm for sale. It is situated near Petersburg, and possesses many advantages. The death of its late owner necessitates the disposal of the property at a sacrifice, and those wishing a fine homestead in the South should give the announcement attention.

Catalogues Received.—From E. M. POTTER, Kalamazoo, Mich., Price List of Fruit Trees, Grape Vines, etc ...From JOHN SAUL, Washington, D. C., Descriptive Catalogue of Dutch and other Bulbs....From PETER HENDERSON, New York City, Bulb Catalogue for 1872.

Mink Culture.—ELLIOTT LOOMIS, Wright Co., Iowa, will find an article on mink culture in the RURAL NEW-YORKER, May 27, 1871, page 331, which will answer his inquiries, or most of them. He can get the paper, if he has not got it, by sending ten cents to this office.

THE SEASON, CROPS, PRICES, ETC.

Deer Creek, Iowa, Oct. 3.—We have some of the finest weather you ever saw, and some of the finest corn. We are feeding large numbers of cattle for you in the East. Our crops were good, as regards corn, barley, oats and wheat. New corn, 15c. offered; barley, 35 to 40c.; oats, 14c.; wheat, Spring, 85 to 90c.—Winter, $1.10; hay, $2.50 per ton. A good place for help; wages have been from $20 to $22 per month for three years. Iowa is the place for Eastern people who wish for good, new homes, with nearly all the advantages of any new country—health, climate, soil, cheapness of land, natural advantages, etc.—J. W. J.

Sherman, Osceola Co., Mich., Oct. 15.—No severe storms as the sun was crossing the line in Sept., but plenty of warm showers. We have been blessed with an excellent season and good crops. Country new; the counties Mecosta, Osceola, Wexford, and others adjacent, a few year ago (not exceeding six) were hardly known except to the trapper and the red man. Now, nearly all the "public domain" is occupied (principally homesteaded). Hay $20@30 per ton; corn, ears, 50@75c.; oats 50c.; potatoes for a year or more have been from $1 to $1.50 per bushel; at the present time worth 80c.; pork per barrel from $14@16; per pound 10c.; butter 30c.; eggs 20c.; flour $8@10.—L.

RURAL BREVITIES.

WE call attention to the Tea advertisement, by Mr. DEXTER, in another place.

THE Aldine, for November, is superb—both in text, illustrations and mechanical appearance. Get it.

H., Wellsville, O., asks where he can get a full-blood Newfoundland or St. Bernard dog. We do not know.

THE Beekeepers' Association for the Central District of Iowa, meets at Oskaloosa on the first Wednesday in November.

THE correspondent at Drake's Mills, Pa. (who fails to sign his name to his letter) is informed that we have not preserved the address of the party referred to.

IF R. D. LLOYDE will address HENRY HIRT, 279 Avenue B., or American Zinc Co., 19 Cliff street, or New Jersey Zinc Co., 61 Maiden Lane—all of New York City—he may get definite answers to his inquiries.

MR. W. F. is informed that the entries of stock for exhibition at the New York State Fair do not necessarily indicate that the stock entered was all there. Some breeders make entries for the purpose of having their stock advertised in the Society's catalogue of entries.

WELL! The Country Gentleman says *its* correspondent *did not* say that he could find no steam plows in operation in England, and the Germantown Telegraph says *its* correspondent *did* say so. If it makes any material difference to our contemporaries, let the difference be made.

THE CRISIS IN COURTSHIP.

AT LAST.—THE CRISIS.

AFTER a long, and not altogether undelightful courtship, which has run like a rippling brook clear through the Summer, and extended far into the Autumn—so far that the leaves have nearly all fallen from the October trees—our young man from the city has reached the decisive moment. He went up into the Catskill Mountains to spend the Summer, and fell in love with RUTH, farmer HOWARD'S daughter, the moment he saw her. Old farmer HOWARD always had his suspicions about this velvet-coated city chap, and he doesn't intend to have RUTH snatched from him unawares. If the reader looks behind the big tree, he will see the expression of anxiety upon his face. RUTH is listening, but we fancy, from the way she folds her hands, that her mind is made up. If she says "yes," the young man will be happy. What the old gentleman will do no one can safely say. But if we may venture a prediction, he will double up his fists the moment RUTH says "yes," and will inform the stranger from the city that he is a plain-spoken man, who will stand no nonsense; that he has not watched RUTH from her cradle to the present moment to see her trifled with. If the young man with the English side-whiskers really loves his daughter, let him come to farmer HOWARD'S house, have a good, old-fashioned country wedding, and settle down on the little farm in the heart of the Catskills. That will be a test of his sincerity which will doubtless prove to the old gentleman that the young man is worthy of his daughter.

Our Story-Teller.

THE LITTLE SISTER.

CONCERNING THE COURSE OF A TRUE LOVE WHICH DID FINALLY RUN SMOOTH.

BY MAY WHITNEY HALL.

CHAP. I.

ONE rosy May morning, not many years ago, Dr. SARDANAPALUS SIMPKINSON and myself turned our backs upon Gotham.

"With its dirty, crowded streets,
Where the ocean of existence on the stony pavement beats."

The Summer had come upon us a month before its time, like a simoon, heated seven times hotter than simoons are wont to be heated, and the city bubbled and seethed in the blistering sunshine. The sweet Spring airs, with their billows of fragrant moistures had suddenly "dried up." The little emerald patches of grass in the areas which were wont to refresh us as we journeyed businessward, had wilted in a day. The hazy green buds in the public squares became yellow and "fell from grace" before reaching the maturity of leaves. The public fountains steamed like the Geysers; poor little brown sparrows lay on the brown earth, fluttering pitifully and panting for breath; and even the hurdy-gurdy's melodious voice rattled ominously in its parched throat. Brick walls seemed to scorch our garments as we passed; and in all the city there was no shady side. People closed their shutters, drew their double curtains, shrouded their pictures, draped their furniture, sent their silver to the bank, bolted their house-doors, and walked, sailed, or steamed away to some of those popular resorts where vulgar hotness cometh not, is advertised not to come. Newport, Saratoga, Nahant, Long Branch, Cohassel, White Mountain Paradises, Lake George Edens—all were crowded with panting, perspiring, limp, slinky and unromantic humanity.

But O! ye searchers after coolness! There was one darling dimple of a valley that ye know not of, where Mother Nature, always bountiful in her gifts, had reared her gracefulest bowers of greenery, spread her richest carpet of blossoms, rolled her clearest rivers, and sentinelled her loftiest hills to keep at bay the general tormentor. Toward the fair spot, after much laborious persuasion on my part, and much lazy indifference on his, SARDANAPALUS and I set our faces, our hearts, (or, rather, *my* heart, for SARDANAPALUS was popularly supposed to be devoid of that all-important organ,) full of pleasant anticipation and satisfaction, and our portmanteaus full of fishing tackle, sketch-boxes, portable-easels, oil-cloth suits and all the *etceteras* of artists and idlers.

I may as well make a clean breast of it in the beginning. I am willing to confess, *entre nous*, that I had laid a deep and dangerous plot against the single-blessed misery of my bachelor friend. To entrap him into my snare I had systematically slandered every Summer resort in the land, condemned every vaunted fishing ground as unworthy a scientific angler's efforts, insulted and abused Mine Host of the Sea Cliff House, who had offered us free accommodations for the Summer (which SARDANAPALUS had had more than two-thirds of a mind to accept), and burdened my soul with innumerable perjuries, that I might lure my unsuspecting victim into the toils prepared for him at "Chalker's." My Susquehanna property is a precious bit of scenery, as everybody knows, but I did not hesitate to say to SARDANAPALUS that the far-famed Alps dwindled to insignificant mole hills in presence of my mountains; that the view from the top of Vesuvius was a cheap penny-print compared with the sublime picture framed by my garret window; that the big trees of the Yo Semite were mere blades of grass beside my magnificent Elms, Oaks and Pines; that the Amazon was a time-serving ditch, unworthy of mention in the same breath with my Susquehanna, the only living river on the ball, literally alive, as it was, with fish; in short, that the Garden of Eden was a passable handful of dust, and moderately fruitful; but if you want a real *rara avis*, go into my melon patch! And if SARDONAPOLIS doubted, it was not for want of exaggeration on my part.

"Any females down in that old den of yours?" he inquired one day.

"One or two, I believe."

"What sort?"

"The usual pattern."

"Rather indefinite, considering that we have at present several hundred types (all equally undesirable). Of what particular stamp are these two?"

"The stamp of CAIN, doubtless, since they are undeniably descended from the 'daughters of men.'"

"Unpromising head of stock for a feeble ABEL like me to cope with! Young?"

"Compared to the Sphynx—yes."

"Good-looking, the regular 'swell stuff,' you know?"

"Tastes differ. You may think so, since 'beauty lies in the beholder's eyes.'"

"You mean that Beauty lies despite the beholder's eyes (and to spite its own). Well—are they *plummy*?"

"—— as church mice."

"Good. City-bred, of course?"

"You had better not talk of city-bred before Aunt SUE. She 'can't abide it;' makes her own 'risin's' and turns out more marvelous things than ever you saw at DELMONICO'S."

"Very likely. Am I expected to get up a *grande passion* for either of these marvels?"

"Of course you are! You'll fall in love with each and all of them on the spot, you dainty fellow, or you're a lost and undone creature! Aunt SUE would never forgive you if you slighted the least of her mirificulous productions. Prepare, then, to swallow them, each and several, without a grimace, if you would 'live long and prosper.'"

"So—they are 'Aunt SUE'S' daughters, are they?"

"'Still harping on my daughter!' What a pity you haven't outlived a portion of your youthful susceptibility! I assure you I referred only to Aunt SUE'S pastry, not her progeny. The latter you may slight if you choose; but beware how you trifle with the truffles!"

"Now let me tell you, once for all, JOHN CHALKER," he burst out in a rage; "I'll not take one step toward that stupid old place of yours if I'm to be bored with cork-screw curls, and ruffled with frills and flowers. You know I *hate* petticoats, and I *will* be free from them for one Summer. Banish your petticoats and I'll come; otherwise I'll go to—the Sandwich Islands first!"

"Most horrible heathen! would you have me request my ladies to go about *a la* EVE, an abomination to every right-minded community?"

"I wouldn't have them go about at all. Let them keep out of sight. Tell them the open air is warranted to turn bismuth black as ink; or say I've a glass eye, false moustache and a cork leg! Anything to preserve us from the dear creatures' beguilements! Why need you have invited them to CHALKER'S at all?"

"Didn't. My grandfather saved me that trouble with one of them half a century ago! That one is Aunt SUE, a faithful old colored woman who has been in the family all her life, and she is the best cook this side of Paris. No born CHALKER would think a dinner perfect unless Aunt SUE had a finger in the pie." (Signs of a watery mouth on the part of SARDANAPALUS, who had a weakness for good cooking.) "The other female"—ominous pause and a scornful snort from SARDANAPALUS—"is a poor relation of mine, a sort of ninety-ninth cousin by marriage with a recently deceased CHALKER, who literally died on his knees begging me to care for his penniless widow and orphan baby." (Signs of relenting on the part of SARDANAPALUS, who has a weakness for poor relations.) "He was a fascinating fellow in his youth, this same CHALKER, and married one of the loveliest women of our set; but he led her a life of it, with his dissipations, his reckless extravagance, and cruel indifference. I have reason to know that the poor girl has seen more comfort and happiness, since she became my housekeeper than she has known all her life. It's her first breathing-space—ten long years—and I don't like to turn her out upon the bitter charities of the world with that helpless infant crying for bread in her weak arms, and all because S. SIMPKINSON, Esq., has a prejudice against petticoats!" (Decided symptoms of watery eyes on the part of S. S. Esq., who has a mawkish leaning toward all penniless widows and orphan children.) "Besides, we are not likely to be blessed with much of *her* society. *She'll* never attempt beguilements with either of us."

"Why not, since she's a woman and a widow?"

"Wait and see."

"Well, the cook is always a privileged petticoat, and the widow don't sound formidable; but are you sure this is all the *genus woman* we shall encounter?"

"Yes, fortunately—I'm sure of that."

"All right—I'll go ahead." And ahead he went straight into my trap."

A word about SARDANAPALUS might not be amiss just at this point. Fifteen years ago, at our Alma Mater, he had been of all my chums most chummy, although "not to decedge on," as Mrs. GAMMIDGE would say, he did not at that time give promise of his present greatness. To tell the absolute truth, "not to prevaricate," he was the blockhead, *par excellence*, of our class, and was put upon by all the other blockheads in the most atrocious manner. He was at that time a handsome, good-natured, jovial, fun-loving fellow, frank, confiding and affectionate to a fault, so ignorant of the world and its crooked ways that the 50's called him "Innocent Sardine," in derision.

"No fun, and all the flogging" had been his portion from the cradle; and now, were gates to be "lifted," shop-signs to "meander" from their natural courses, or any dust to be raised by the gallant 50's, Innocency was the first to be called into requisition, and the last to leave the field, usually—owing to his comrades' trickery—in the hands of the police. In every rush the sardine's jolly and determined face fronted the van; in consequence of all which irregularities he usually fronted in a different direction on examination days. Upon one occasion he was suspended for six months for disturbing and breaking up a junior exhibition by vigorously blowing pepper through a paper funnel, backed by a crowd of accessories who made him their mouth-piece and then ignominiously fled, leaving him sole offender and endurer of the punishment.

Had this been all, poor SARDANAPALUS would to-day have been a different man; but his affectionate and susceptible nature was too well known to escape scot-free. In his senior year a beautiful and accomplished young lady was "set at him" by the 50's, who, after winning the boy's fervent and whole-souled adoration suddenly deserted him and bestowed her affections elsewhere. Mortified beyond endurance and stung almost to madness, the sensitive boy left the University and the country; and for ten long years not a syllable was known of his whereabouts.

At last, when everybody had about forgotten him, like Poor PILLICODDY'S servant's cousin's first husband, he "suddenly turned up again," but not a trace of the original "Innocent Sardine" remained visible. He was neither good-natured or jovial. His genial frankness had crystallized into chilly reserve. All affectionate, tender impulses seemed as foreign to him as to Mont Blanc. No devious way of this wicked world was too dark for his eyes to discern, or too crooked for his mind to follow, although his feet scorned to tread them. He was bitterly sarcastic, professedly incredulous about honor, virtue, and all those noble qualities wherewith we strive to dignify poor human nature. At times he was snarling, captious, surly, currish and misanthropic; a thorough-going cynic, morbidly irritable, easily excited to intense anger, a bundle of nerves which a puff of wind or a pinch of dust would set in a fury. At others he was unfeeling enough, seeming utterly indifferent to pleasure or pain. A dull apathy dimmed his spirit's lustre, and made him a proper disciple for Zeno.

Despite all this I could not help liking the fellow somehow. I couldn't convince myself that the original "Innocent Sardine" was not lurking in some intricate passage or hidden chamber of his large and companionable nature. Little things like these kept up my spirits.

The scapegrace of Class 50 had come to be a great power in our world. The only degree conferred by an American University (that of Blockhead) had secured many valuable additions from the foreign institutions where he had spent much of his ten years abroad. It was no longer Simple SARDANAPALUS SIMPKINSON. He was an A. B., an M. D., a Ph. D., an LL. D., an F. R. S., and mercy knows what beside.

Now, although he practiced medicine, was eagerly sought after, treated the most obscure and complicated diseases, and was trusted with the most delicate cases, he would forego a wealthy and distinguished patient any day for a poor wretch who could fee him only with "God-bless-your-honors!" 'Tis true, he wrote the most popular tales and poems of the day; but he always bestowed them on the least popular journals, and thereby made their fortunes. Every year his one picture "hung on the line" at the Academy, and brought a fabulous price; but each picture had a thousand eloquent tongues, which cried out some popular vice, or cried in some unpopular virtue! Beside which, you may be sure the thousands which they brought speedily found their way into emptier purses than SARDY'S. He had fallen heir to a princely fortune, but no man lived more plainly. He possessed a palatial home, but it was a rendezvous for all his poor relations—a perfect hospital for indigent country cousins. Notwithstanding his reputation as a woman-hater, nine-tenths of the female world courted, feted, flattered, and adored him; and though he permitted their citations, only on the remaining tenth did he condescend to smile. This tenth, be it understood, was largely made up of the aforesaid country cousins, with a little sprinkling of the family servants and whoever among his poor patients proved themselves honest and virtuous. To the world, therefore, this poet-artist-physician was a profound mystery. His name stood for any unknown quantity of contradictory words and deeds. He had double the eccentricities usually attributed to genius, and was, therefore, supposed to be doubly charged with that mighty power.

But I knew you better, my SARDY. I had caught too many glimpses of your other, better, and dearer self; and I couldn't help hoping and believing that some "divine perfection of a woman" would yet appear, undoing the disastrous work of long ago, and restoring RICHARD to himself again. And so she did, with my help.

Where my lovely river slumps itself a silver crescent, gleaming from the hazy landscape like a Summer moon from out a wilderness of rolling clouds, upon the loftiest of all the pine-fringed hill tops on its western shore stood, and still stands, I hope, the old CHALKER farm house, facing the river, all its little square eyes wide open, one morning, with the surprise and delight of our arrival, and so flushed with excitement or red ochre that the most radiant sunrise could scarcely have deepened its tint a single tone.

"It's a good-natured, wholesome-looking house, a trifle vulgar, perhaps, and a little too much inclined to indulge in old-fogy notions about 'spare-rooms,' 'best double-warp rag,' gaudy chintz covers, and crystalized straw bouquets; too much back kitchen for elegance, and too little front hall for airiness; an immoderate overplus of verandah, useful, however, to lounge on at sunset or moonrise, and no lack of 'outrageous shade' to loll under at noonday; a confirmed sentimentalist, not to say transcendentalist, just the place to indulge in an *grande passion* almost sorry we tabooed petticoats; perhaps the widow will prove 'plummy' after all and give us a little sensation! I imagine the old shell is pigeon-holed from garret to cellar, and stuffed with tender, melting memories, souvenirs of many a dead friendship and equally lifeless enmity. It looks altogether like a hospitable and enjoyable old den, and lacks but one thing to make it perfectly satisfactory," soliloquized SARDY, throwing himself down under the elms, and rolling in the fragrant clover with all the *abandon* of boyhood.

"What's that!" I asked, a little maliciously; "we may be able to supply it at a moment's notice!"

"A pretty woman to welcome us! It's a graceless world after all, CHALKER, without the dear creatures. Taking them at their worst they prevent our relapsing barbarism, and if we could only have them at their 'shiny best' I fancy the next generation would usher in the millenium! What could be more angelic, now, than a fresh young creature coming out from that vine-clad porch to meet us, her face as fair and innocent as the daisies under her feet, her soul as pure and chaste as the simple white robe she wears, her heart as light as air and warm as sunshine, a child in imagination and experience, a woman in intelligence, who knows nothing of the vain pleasures and vile passions of the world, and would scorn them if she did. *Ach Gott!* it makes my heart beat faster to think of such an apparition! Produce such a petticoat and I'll fall on my knees and swear allegiance to it on the spot! Its wearer shall be my Walter and I her patient Griselde all the days of our lives!"

The words were scarcely uttered when, as if conjured out of sunshine by his fervent speech, a dreaming little creature appeared among its vines who seemed the impersonation of his ideal "petticoat." Nothing could have been more irresistible than that petite figure framed by wild Grape and Columbine, its plain white dress floating about it in statuesque folds, the head bent forward as if in eager expectancy, the blue eyes—turned toward the dusty road—shaded by one dimpled hand, while the other rested caressingly on the curly pate of the orphan CHALKER; and to me no sight could have been more unwelcome at that moment. I was more astonished by the unexpected vision than SARDANAPALUS himself, who sprang to his feet, smoothed his rumpled plumage, and stood hat in hand looking as if he was quite ready to perform his rash vow without further ado. Here was a pretty state of things to begin with.

The portly lass discovered us at last, and bounded across the lawn to meet us, young CHALKER tumbling after and raising a great shout at sight of "Uncle DON," taking unlimited possession of me and leaving SARDY all unprotected at the mercy of his fair foe. He rather seemed to enjoy it, however, and when the girl modestly, yet fearlessly, presented her hand, welcoming him in the name of "Sister JOSEPHINE," who, she said, "had met with an accident this morning and might be unable to appear for several days," he seemed suddenly transformed into the old, susceptible, innocent "Sardine."

The girl had greeted me warmly enough to have satisfied the conceit of any ordinary egotist; but the way she became self-conscious and lavished blushes and timid half-glances on SARDANAPALUS, making vain efforts to be dignified and "grown up" in return for his overpowering bow, and altogether reprehensible manner, was quite too much for me.

"Do behave yourself, SIMPKINS!" said I, severely; "don't you see you are frightening the poor child (she *is* but a child) clean out of her wits with your BEAU BRUMMEL airs! There, there, never mind! He don't mean anything, my dear," I added, in my most paternal manner. "Take the baby and go to the house and we'll follow presently. By the way, present our compliments to Mrs. CHALKER, and say we most sincerely deplore the event which deprives us, even for a short time, of her presence. And tell her I must see her or communicate with her immediately on business of the utmost importance to us all."

"Please to add," put in my friend, for no other reason than to detain her as long as possible and feast his eyes on her fresh, young loveliness "please to add that SARDANAPALUS SIMPKINSON, M. D., will be most happy to devote to her service his medicine case and his entire collection of surgical instruments, together with whatever influence he may possess over the many 'ills that flesh is heir to.'"

"I will deliver your message *verbatim*," she replied, with an arch smile; "and I am sure my sister will be grateful for your kind offer, although I fear the nature of her ailments will preclude the possibility of its acceptance."

"Of course I shall not press my services, but I assure you I have treated successfully some very severe cases," he replied, with dignity.

"O, I do not doubt that, and I'm sure Sister JOSEPHINE would be only too happy; but—"

"Tan you mate hair drow in a minnit, dotter?" demanded the urchin CHALKER; "muse mamma burned hers all off 's mornin' turlin' it on 'e tom's! 'At's reason she couldn't tum down!"

The young rogue was carried off immediately amid the irrepressible laughter of the party, who confessed himself unequal to such an emergency.

"Who is she?" he demanded, the instant we were alone. "What a delicious voice she has! And how well she talks! What enchanting eyes! And whoever saw such an avalanche of golden hair tumbling over such graceful shoulders! And it's such an unsophisticated party! Did you see her blush when I kissed her hand? There's no coquetry hidden under that frank, earnest manner; it's perfectly evident that she has kept herself 'unspotted from the world;' so far her days have been spent in

"'Maiden meditation, fancy free.'"

"I should hope so! Why, man, the chit can't be ever sixteen years old—a mere baby! I didn't know who she was at first, but I remember now that Mrs. CHALKER asked permission to bring on her little sister to take care of baby. I can't imagine how she happens to be here after the positive orders I have given that no petticoats are to be tolerated on the premises during our reign! But don't fret over it SIMPKINSON, she shan't trouble you long. I'll pack her off in the next train without fail."

"Do it at your peril! Why, you malicious old idiot, don't you suppose I know why you are so anxious to get her out of my way? But you'll not succeed in your little game. That 'chit' is old enough to prefer all the 'cardinal virtues as embodied in SARDANAPALUS SIMPKINSON, Esq., rather than such stale attractions as you have to offer. Hie you to your widow with the singed foretop, and leave to me the 'little sister,' whose wavy locks have never known the embrace of tongs. By the way," said he, after a pause, and growing grave enough to atone for his past extravagance, "do you know, CHALKER when I had been abroad about five years I heard that *you* had married a certain lady well known to the 50's? If you had——"

"Well?"

"I should have pitied you, that's all. And I should have been likely to give you a wide berth on my return. I wonder what it was reminded me of LEO? Certainly, nothing could be more unlike her full-blown Summer beauty than this little Spring bud, without a leaf uncurled! The two resemble each other about as much as a 'big sunflower' resembles the delicate pink blossom of the trailing Arbutus! And yet, CHALK (stop laughing at me, you big brute), I confess that when I looked down into her innocent blue eyes, I felt the same intense pleasure which thrilled me from head to foot when I used to look into JOSEPHINE'S languishing black orbs, and which I never felt before or since. It's strange, but the child really affects me as JOSEPHINE used to. I almost fancied I smelled the same perfume which that arch coquette always floated about in. And now I remember she said 'Sister JOSEPHINE' with the same accent which *she* used in pronouncing her own name. It would be strange if——who married JOSEPHINE, CHALKER?"

The question remained unanswered, for the widow's little sister appearing once more, we advanced to meet her, and received the messages she bore, one of which thanked SARDY and declined to accept his services, while the other granted me an immediate interview.

"Show the Dr. to his room, and see that he is provided with all things necessary to his comfort," said I in departing.

"I will, with pleasure," she replied.

But when I looked back, SARDY had seated himself beside her in the vine-clad porch, and looked as if, without further trouble, everything necessary to his supreme felicity had already been provided.—[To be continued.

Ladies' Port-Folio.

THE GIRL I'M GOING TO WED.

BY FANNY M. BARTON.

THERE was never a girl
With so golden a curl,
With lips so fragrant and red,
With teeth so white
And with smile so bright
As the girl I'm going to wed.
O, the blue of the sky
Is in her eye,
And the roses of June on her cheek;
And the words leap out
With a dimple and pout,
When she opens her sweet mouth to speak.

'Tis only one, dear,
One beautiful year,
Since the first time I met BESSIE LEE,
Where the May breezes blow
The orchard's pink snow
In the shade of an old apple tree.
The robin's made love
In the branches above,
And the sky seemed bending to hear
Her musical words,
Like the soft notes of birds,
And her laughter, so ringing and clear.

I saw her last night,
In the dim twilight,
Under the same apple tree;
And persuaded her there
With a kiss and a prayer,
To be my own BESSIE LEE.
Like an angel she seemed
When her fond smile beamed,
Won from its bashful eclipse,
Her face was so fair,
From the soft, shining hair
Down to the sweet, roguish lips.

I shall go for my bride
In the Autumn tide,
When the starry asters shine;
When the wild grapes glow
With the purple flow
Of the ripe, imprisoned wine.
Then sorrow will flee,
For with sweet BESSIE LEE
Nothing but joy can abide,
And life's weary way
Will be flowery and gay
With my bonny wee wife by my side.

WOMEN IN CALIFORNIA.

BY FULLER-WALKER.

"THERE have been Americans who saw Rome before they saw Niagara; and for one who has visited the Yosemite, a hundred will tell you about the Alps, and a thousand about Paris," says Mr. CHARLES NORDHOFF, in opening his book on California. He would turn the tide of travel towards the Pacific coast, into a tropical country, where we may enjoy home-comforts. In making the trip over the beaten track in California, he says there are no inconveniences which a tenderly reared woman would not laugh at. The noble art of cooking is better understood in California than in the East, the bread is far better, and the people are more civil. He finds the journey over the Pacific Railroad nothing but a pleasure. You are in a drawing-room car; your wife sits at the window sewing and looking out on long ranges of snow-clad mountains, or on boundless ocean plains; children play on the floor, or watch at the windows for the comical prairie dog. You converse as you would in your parlor at home.

On his way to Salt Lake City Mr. NORDHOFF fell in with a party of BRIGHAM YOUNG'S family. He says:—"Mrs. YOUNG fell to my lot—a handsome and clever person, well made up in every way. Mrs. YOUNG—I mean another Mrs. YOUNG, also handsome and clever—was seated beside another gentleman. I believe six or seven of Mr. YOUNG'S wives were distributed through the cars, and quite a number of his children." Mrs. YOUNG, speaking of Indian girls, said that if they were taken early and trained, they made excellent and faithful servants. "Mr. YOUNG," she said, "has had one in his house for many years, and she is a very good woman, and would not return to her people." One Mrs. YOUNG related to some of the ladies that Mr. YOUNG takes no dinner, but only two meals per day. He is not able to meet all of his fifty-five children at one meal, and therefore breakfasts with one-half of them on one day, and with the other half at another time. Two of Mr. YOUNG'S married daughters take part in the theater at Salt Lake.

In San Francisco our author says ladies and children may safely and properly walk in the main streets in the Chinese quarter by day. He took his wife and family to the Chinese theater. The boxes are up stairs at one end of the gallery; opposite you will see the Chinese women huddled together in a place by themselves; the audience below vehemently resents the indecorum of a woman appearing in the pit. Going to the Yosemite Valley, which in the Indian tongue signifies "Large Grizzly Bear," Mr. NORDHOFF took with him a weakly girl of ten years, who enjoyed every foot of the ride and was benefited by it. No lady who is not physically or mentally incapable of walking a mile, or sitting on a very quiet and sure-footed horse, need have the slightest apprehension of the tour of this valley. The finest excursion within the valley is to the Nevada Falls, which ladies and children are sure to enjoy. Mr. NORDHOFF says ladies and children may make the tour of the *rim* of the valley with perfect safety and convenience. The wayside inns are clean, the food abundant and the service polite.

Of Chinese house-servants in San Francisco our author says:—"You ask his mistress, and she tells you that she has no disputes, no troubles, no worry; that JOHN has made housekeeping a pleasure to her; if he is cook he does not object to help with the washing and ironing—in fact does it better and quicker than any BRIDGET in the world. And JOHN'S master chimes in with an assertion that since JOHN has reigned below the kitchen has been the delight of his eyes, so clean and sweet is it. Moreover, JOHN markets for his mistress; he is economical, and he does not make a fuss."

Our experience with "JOHN" in a New York kitchen has been quite different. He could only cook rice well; he put a whole half of a sheep into the oven to roast for a small family; he was very sloppy in the kitchen and he made such violent love to the Irish girls we were obliged to dismiss him.

Mr. NORDHOFF writes of Southern California as a delightful place for invalids, women as well as men. The temperature is even, the air dry and warm in the Winter, the scenery grand and beautiful. He especially recommends it for all suffering with lung complaints and throat diseases. All through his book Mr. N. has an eye out for the women and children. It is to be commended for that besides its other merits.

WOMAN PERSONALS.

ACCORDING to a letter (seemingly well inspired) in the *XIX. siecle*, the Empress CARLOTTA maintained her physical health, not only unimpaired but to some extent improved, while her mental derangement has reached the last stage of imbecility. She lives estranged from all her family, resolutely declining to see either King or Queen, who are forced to content themselves with catching a glimpse of her during her occasional walks in the grounds of the Chateau Tervuerer. Her physicians have abandoned all hope for her restoration to sanity, while they augur favorably to her general health. Her mind still dotes on her lost empire, and all her caprices, and they are many, run in the direction of imperial state pageant. She constantly dispatches telegrams to NAPOLEON III., who, she believes, still reigns; and, saddest of all, the name of Maximilian is seldom off her lips.

IN the Patent Department at Washington there hangs the picture of a Yankee woman who is regarded as one of the smartest in the country. She worked in a paper bag manufactory in Springfield, and there studied out a machine for turning out at one process a paper bag, pastel, stamped and ready for use. The model and exemplary masculine whom she employed to get ready her pattern started off to Washington on his own account and patented her idea in his own name. Whereupon began a long and hard fight before the Patent Office, lasting several days. She won her case, and has since refused $100,000 for her patent. She has also invented a patent fan, to be suspended in rooms and halls, it being wound up like a clock and running several hours.

MRS. MINNIE MILLER, wife of the poet, JOAQUIN, has been lecturing in San Francisco about her husband. Her lecture was a success, and she is spoken of as a genius, a greater woman than he is a man. She is the mistress of satire, a woman of energy, who has passed through a world of care and sorrow. She is a pale, thoughtful woman, not so handsome in form and figure as she is in soul, which gleams out of her eyes and lights up her face. Her hair droops about her shoulders in a wreath of ringlets. She had but a four or five days' courtship with the poet, and says:—"On Sunday we were married. It was mostly my fault. JOAQUIN has often reproached me for it, and I feel the justice of his reproaches."

MISS RANSOM of Cleveland, Ohio, painted the first picture ever bought by the Government, of a woman. She has recently finished a full-length portrait of Gen. THOMAS, which is regarded as a work of great merit.

MISS MINNIE C. SWAYZE has lectured on "A Woman's Plea for Reform."

MARRIAGE.

LEIGH HUNT concludes an essay on marriage as follows:—"There is no one thing more lovely in this life, more full of the divine courage, than when a young maiden, from her past life, from her happy childhood, when she rambled over every field and moor around her home; when a mother anticipated her wants and soothed her little cares, when her brothers and sisters grew from merry playmates to loving, trustful friends: from Christmas gatherings and romps, the Summer festivals in bower or garden; from the rooms sanctified by the death of relatives: from the secure backgrounds of her childhood, and girlhood, and maidenhood, looks out into the dark and unilluminated future away from all that, and yet unterrified, undaunted, leans her fair cheek upon her lover's breast, and whispers. "Dear heart! I cannot see, but I believe. The past was beautiful, but the future I can trust— with thee!"

DEVOTION to public opinion was evinced by a lady aged eighty, who recently married a man of correspondingly appropriate age, because he "comes about my house so much, if I don't marry him people will talk."

Reading for the Young.

THE BOY'S VERSION.

BY ANNIE JENNIE.

It may be that you passed her, Sir,
When coming down this lane?
A woman bent, with tired look,
Her clothes, you know, are plain
And coarse, but clean and tidy-like—
There's coming up a rain!

I've brought her out this old umbrell—
She is my mother, Sir!
And though she washes, is not well,
But I'm her comforter;
If I'd grown up like other boys,
I'd have supported her.

But since I got that awful fall
I've been a cripple quite,
And mother has to work so much
Her face grows thin and white.
It's hardest pain I have to bear
To see her sew at night!

Yes, Sir; we manage very well,
If ladies only'd pay;—
Last week, new cushions for the church
Took their spare change away;
The ladies said, our *little bills*—
They'd pay them all to-day!

I s'pose, Sir, ladies never think
How much a *dollar* 'll buy,—
They never get an *ounce of tea*,
My mother says that's why;
Do you suppose that *they* could guess
How "hungry days" *drag* by!

My mother, Sir, 's a lady, too;
She's gentle, and polite.
She says our grief's, if bravely borne,
Are like the stars at night,—
When shining thro' the deepest gloom
They show their sweetest light.

She's never cross, but always kind,
And hopeful all the while,—
Oh, there she comes! I'll hobble on,
To see me 'll make her smile.
'By, Sir; just see how spry she walks—
Two dollars's quite a pile!

YOUNG FRIENDS, SEE HERE!

HOW YOU CAN DO GOOD AND MAKE IT PAY.

BOYS AND GIRLS, Young Men and Maidens, who read the RURAL NEW-YORKER—your attention, please, while we briefly talk about a plan for the mutual benefit of Yourselves, the People and the RURAL.

And first,—now that the long evenings are coming, or have come, and Winter is rapidly approaching,—thousands of people who have been busy for months, have, or soon will have, abundant leisure for reading and study. Good papers and books therefore will, or ought to be, in demand for weeks and months to come, especially throughout the Rural Districts, which extend from Canada to California and Maine to (Minnesota would be alliterative, but we must go further now and say) Alaska. Now we think the RURAL worthy of a cordial welcome in the homes of the intelligent and progressive all over the afore-mentioned widely-extended districts, and that it will speedily receive such in tens of thousands of them, provided its readers give it a proper introduction. But "there's the rub." Who, and how many, of *its* friends will make the RURAL favorably known to *their* friends and acquaintances?—thereby inducing them to become members of the great "Rural Brigade," which already has representatives in every State and Territory of this Union, the Canadas, and nearly every foreign country where civilized people dwell.

To accomplish our object—viz., to largely extend the circulation and influence (we trust for good only) of the RURAL NEW-YORKER—we especially need and ask the aid of those herein addressed, the Young People of America, or, in common parlance, "Young America." We *know* that they *can*, if they *will*, give this journal an immense circulation. All that is necessary is a little timely and persistent effort, for almost any young person of either sex to obtain from ten to fifty or one hundred subscribers. While in our teens we obtained large lists of subscribers for popular papers, and, as the book says, "What has been done can be done again." We began business as editor and publisher while a minor, and our observation thus far proves that, as a rule, the world is moved—that its business is mainly transacted—by intelligent, industrious and enthusiastic Young People. This is neither flattery nor sophistry—only the plain, unvarnished, demonstrable TRUTH.

Now, Young Friends, while soliciting your efforts in behalf of the RURAL, we do not ask or expect you to "work for nothing and find yourself." On the contrary we not only offer, but actually give you "*Good Pay for Doing Good.*" For particulars see our new List of Premiums on page 271 of this paper. You will there find that we offer a variety of choice, beautiful and valuable articles, many of which are useful and desirable for Young People. Please look over the list and then decide whether it will pay you to introduce the RURAL NEW-YORKER to notice and support in your locality. We think it will, but you must decide and govern yourselves accordingly. If you decide to form a Club, however, remember that *Now is the Time to Start*, as those early in the field will be most certain to succeed.

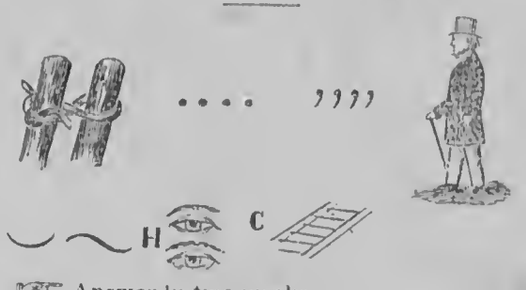
WHO IS IT?

DID you ever play "Who is it?" If not, procure some card board and prepare a number of cards. I had fifteen to commence with, and have over sixty now, the right size to hold conveniently. Number these 1, 2, 3, and so on until they each bear a number. Then prepare some small cards to correspond. Place the small ones in a box and shake. Distribute the large ones among the players. Then ask a question, beginning with "Who." Draw one of the small cards and read the number. The one who holds the larger card of the same number is the answer to the question, and must ask the next question. You need not feel flattered if you happen to be the one who is wisest, or wittiest, or the best musician, for your next card may pronounce you the silliest, vainest, or greatest humbug in the crowd. Here is a sample of some of our questions. Who wears No. 3 shoes when they ought to wear 13's? As HARRY likes to have his feet called small, we were rather amused that it fell on him, and declared the cards always told the truth. But when the answer to the question—Who has not combed his hair in a month?—fell on EMMA, the neatest one of us all, we pronounced them fallible.

North Fairfield, O. L. E. K.

The Puzzler.

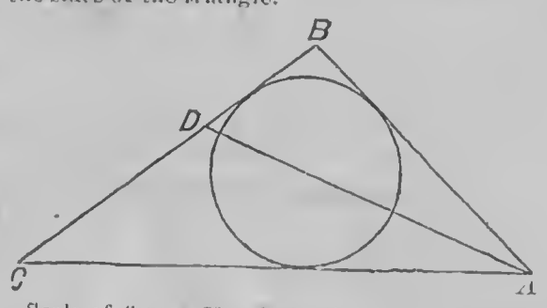
ILLUSTRATED REBUS.—No. 14.



☞ Answer in two weeks.

PROBLEM.—No. 5.

A TRIANGLE having a perimeter of 100 rods, and an area of 400 square rods, has one of its angles bisected by a line drawn to its opposite side, which line is 30 rods in length. Required, the sides of the triangle.



Scale of figure, 20 rods to the inch. A D = 30 rods; A B + B C + C A = 200 rods; area A B C = 400 square rods. B. F. BURLESON.

☞ Answer in two weeks.

HIDDEN TREES.—No. 1.

1. BRING that map, Leonard, and I will show you.
2. See that bee amusing a butterfly.
3. He puts his top in every place but the right one.
4. Bring me, in exchange for that butter, nutmeg and allspice.
5. O, a katydid caught a shad. (Two trees.)
6. Go and tell them; lock the door first.
7. Did you say that was a thick or yellow cloud?

☞ Answer in two weeks. J. M. SHERK.

MY PLANTATION.—No. 1.

1. If I plant a milk house, what will come up?
2. If I plant a cross little girl, what will come up?
3. If I plant some birds, what will come up?
4. If I plant a bee, what will spring up?
5. If I plant a Winter, what comes up?
6. If I plant a sunrise, what will come up?

☞ Answer in two weeks. GRACE.

PUZZLER ANSWERS.—Oct. 12.

ILLUSTRATED REBUS No. 12.—Governors, rulers and statesmen should possess courage, honor, wisdom and integrity.

RIDDLE No. 4.—Jonah—the dwelling-place within a great fish.

Problem No. 3.—I have received several communications from various localities, asking for the solution to Problem No. 3, of Sept. 7. Will you permit me through the RURAL to say to these, and to all others interested in that problem, that its solution is very long and intricate; the essence whereof, however, is all contained in the following principle, discovered, as others may discover it, by dint of hard study:—The supplements of the three angles about the point (P) [see figure] are found in the same manner as the three angles of a triangle are found when the sides are given, by considering the lines given in the problem as constituting the sides of a single triangle. When the three angles about the point (P) are determined, we shall have two sides and their included angle given in each of three triangles to find the third side. These third sides constitute the sides of the triangle required. B. F. BURLESON.

News of the Week.

CURRENT TOPICS.

The Will of Wm. H. Seward.

THE Will of Mr. Seward was opened by the family Oct. 16. It is a clear, succinct document, singularly free from legal technicalities, and written entirely in his own hand. He bequeaths his late home at Auburn, with all its contents and surroundings, to his three sons, by one or more of whom it will doubtless be occupied and preserved intact, as far as possible, in its present condition. His other property, consisting in part of securities, but mainly of real estate in Auburn and in this locality, he divides into four equal shares among his sons Augustus, Frederick and William, and his adopted daughter, Olive Risley Seward—the last two being deputed to execute this provision of the instrument. No other legacies or bequests are made. The property has not yet been appraised, and it is impossible to say precisely what it amounts to. Estimates vary, but it will probably be not far from $200,000.

Prof. John Tyndall

is lecturing in Boston, and seems to have won great regard there by his lectures and accompanying demonstrations. In person, Prof. Tyndall is a gentleman of medium hight and rather slight in build. His features are slight, and his manner betokens the accomplished and genial gentleman. His experiments are very brilliant, and are graphically explained. He is one of those who believe that science and practice are related, and that Industrial England and Industrial America could not exist as it does to-day without the aid of what seem to be the aimless experiments of scientists. The only fault we have to find with scientists is, that too often their only aim is to secure for themselves the abstract fame of discoverers—they do not have for an object the benefiting the human family. There are exceptions to this rule, and we honor such.

Sir Alexander Cockburn's Protest.

OUR readers know that the British Arbitrator at the Geneva Conference refused to sign the award in favor of the United States made by the Court, and that he has published a volume of reasons for this refusal to act. These reasons are hailed with delight by certain British politicians and that portion of the English people who have no good feeling for the United States. He (Sir Alexander) attacks M. Staempfli, the Swiss arbitrator, more than intimating that he was biased against Great Britain, and sneers at his views of international obligations, asserting that they are founded on vague notions of general justice rather than on precedent. This we regard admirable; for if precedent does not accord with justice, it is time justice should be substituted.

Peace and Good Will Among the Indians.

THOMAS K. COBB, Secretary of the Board of Indian Commissioners, has returned to Washington from an extended tour among the Indian tribes of Montana, Idaho, Wyoming and Colorado, and reports that the prospect in regard to the whole Indian question is very hopeful, and that the stories concerning the Indian War in Utah are, in the main, fabrications. The Crows, Piegans, Bloods, Blackfeet, Shoshone and Bannock Indians are peaceful, and desire continued peace. The Shoshones have, by treaty, agreed to cede to the United States 800,000 acres of their reservation which, when the treaty is ratified by Congress, will be thrown open to settlement. The territory thus to be ceded contains much valuable mining, farming and grazing land.

Senator Sumner and Minister Washburne.

ONE of the current topics of comment in Paris is said to be the fact that the American Minister Washburne, has not formally presented Senator Sumner to President Thiers. An effort is making to give it the color of a political affront to the Senator on the part of the representative of the Washington administration. We cannot believe it. We do not believe Minister Washburne is made of any such stuff. It is quite as likely that Mr. Sumner would refuse to receive such offices from the Minister as that the Minister should neglect to tender them.

Depopulation of Alsace-Loraine.

THE number of French who refuse to live under and become subject to the German Government, in the provinces above named, is very large. Every available means of transportation out of the country have been adopted, and in Metz it is asserted there are only seventeen persons of an age to serve and subject as recruits remaining; in Obernai, of 6,000 inhabitants, only 3 remain; Havre has sent 1,400 of her population away. The exodus has been great, and the feeling which inspired it bitter in the extreme.

"Goldsmith Maid" and "Occident."

"GOLDSMITH MAID" has made quite a reputation for speeding during the past year. Not long since it was asserted that California had a horse known as "Occident," that was as fast or faster, than the "Maid." A match for $10,000 between the two was made, and October 16 the race came off, ten thousand people being present. "Goldsmith Maid" won the race in three straight heats. Time—2.20½; 2.20¼; 2.22.

Prince Napoleon,

recently expelled from France, proposes to prosecute the Minister of the Interior for so expelling him without due authority of law. M. Rouher has made an appeal to the Permanent Commission of the Assembly in his behalf.

SEMI-BUSINESS PARAGRAPHS.

The People's Friend. — It is susceptible of easy proof that the Sewing Machine has been a greater blessing to the masses of American people than any invention of the present century. Nothing else has done so much to save the lives and health of the wives and mothers —the patient, overworked women of the land— who, as a class, most needed relief from the burthens of everyday life. Every father and husband fails in his duty if he neglects to endow his home with such a triumph of science as the Wilson Under-Feed Sewing Machine. It is the cheapest and best sewing machine ever offered. Salesroom at 707 Broadway, New York, and in all other cities in the United States. The Company want agents in country towns.

Facts for the Ladies. — Mrs. PASCHOL, New Middleton, Tenn., has a Wheeler & Wilson Lock-Stitch Machine in use since 1858; it has run constantly without repairs; has ten of the original twelve needles. Other kinds of machines wear out in a few years; she has never seen a Wheeler & Wilson *worn out*. In 1867, she earned $317.75, besides doing the sewing for her family and six negro work hands and considerable for her neighbors. See the new Improvements and Woods' Lock-Stitch Ripper.

Watch No. 1037, Stem Winder — bearing Trade Mark "Frederic Atherton & Co., Marion, N. J."—manufactured by the United States Watch Co. (Giles, Wales & Co.), has been carried by me since June, 1867; its total variation from mean time being only five seconds per month. —HENRY SMITH, Treas. Panama R. R. Co., 88 Wall St., New York.

Woman's Rights. — While the men have their Reapers, Mowers, Horse Rakes, Threshing Machines, &c., every woman has a just claim to be provided with such labor-saving Implements of household use as the UNIVERSAL CLOTHES WRINGER and DOTY WASHING MACHINE—the best of their kind.

Advice.—Send for free Price List. JONES SCALE WORKS, Binghamton, N. Y.

THE MARKETS.

MONEY AND TRADE AFFAIRS.

NEW YORK, Monday, Oct. 21, 1872.

THERE was a further decided gain in Gold and Greenbacks to the Bank movement last week, and the Loans and Deposits are also higher. The consequence is an easier Money market at 6@7 per cent on temporary loans, while the rates on paper not accommodated at Bank at 7 per cent. are 8 to 12 per cent on the Street.

The trade of the week was fair in Foreign Merchandise, although in the Dry Goods line, as usual at this season of the year, business is falling off. In the Cotton trade larger receipts, liberal exports and higher prices are reported, and in other Domestic Produce the export demand is good and the value of the weekly clearances to Foreign market is on the increase and ahead of this time last year.

In Wall Street the price of Gold has not varied much from 113 per cent. Exchange keeps up, but no Gold Coin remittances have yet been made.

The Government Stocks keep well up with Gold, and the Sinking Fund was again unable to make its weekly purchases under the price of Gold.

The Stock of the Pacific Mail has been the excitement of the week on the Stock Exchange, and nearly *twenty per cent.* was added to the price, which is now above the par value, for the first time in two or three years. The advance since the present management took control, last November, is from 42¾ to 100½ per cent.

Other speculative stocks have been active, with varying fluctuations of 1, 2 and 3 per cent., the last prices varying, on most of the Railroads, but slightly from our last report.

The following are the comparative movements of the City Banks for the past fortnight:

	Oct. 12.	Oct. 19.
Capital	$87,315,700	$88,019,200
Loans	268,248,300	275,557,000
Gold and Greenbacks	57,936,800	65,171,500
Deposits	129,709,300	201,031,400
Circulation	27,737,900	27,706,300

PRICES OF GOLD, STOCKS AND BONDS.

American Gold	113	Erie	50¼
U. S. 6s of 1881	116¼	Union Pacific	39¾
U. S. 5-20s of '65 (old)	116	Rock Island	110¾
U. S. 5-20's of 1867	111½	Northwest	72¾
U. S. 10-40's	109	Ohio & Miss.	45¾

Union Pacifics	89	St. Paul (preferred)	75½
N. Y. Central Stocks	95¼	Bills on London	108¾

PRODUCE AND PROVISIONS.

NEW YORK, Monday, Oct. 21, 1872.

Receipts.—The receipts of the principal kinds of produce since our last are as follows:

Corn, bush	235,400	Meal, bbls	6,618
Oats, "	206,670	Flour, "	101,250
Wheat, "	610,000	Eggs, "	6,705
Rye, "	250	Cotton, bales	21,598
Barley, "	288,000	Hops, "	483
Malt, "	5,200	Wool "	619
Seed, "	48	Butter, pkgs	16,085
Beans, "	6,970	Cheese "	3,180
Meal, bags	449	Lard, "	3,200
Peanuts "	130	Dried fruits, pkgs	2,319
Pork, bbls	45	Cut Meats "	1,766

Beans and Peas.—The supplies of mediums are large and prices are lower. Marrowfats are not so plenty and prices are about steadily held. The business is moderate.

We quote Mediums, prime $2.40@2.50 per bushel; good do., $2.30@2.40; fair do., $2.00@2.25; prime marrowfats, $2.65@2.70; good do., $2.40@2.50; common and fair do., $2@2.25. Green peas at $1.80@1.20. Southern black-eyed peas, $3.

Butter.—The market has improved in prices since our last, much to the surprise of nearly every one in the trade. We have had a continuance of very serviceable weather for this branch of business, and although farmers are in to some extent with dairies, the receipts show a falling off and hence the sudden advance in choice grades of half tubs and correct firkins. Another fact helps fine firkins and half tubs at the moment; this year we miss the usual liberal supply of fresh Welsh tubs, which could be used in the consumptive trade satisfactorily, with a few cents in wholesale buyer's favor. Pails are scarce and will command 50c. for extra. There has been a good shipping inquiry during the past fortnight. Exports have been made to the amount of about 4,000 pkgs. Low prices, of course, have been accepted for it, but then it is so much out of the way.

Orange Co. pails, fine, 38@40c.; Penn. and N. J. pails, good to fine, 26@35c.; common, 15@18c.; selections, half tubs, 33@35c.; half tubs in lots, 28@30c.; good to prime firkins, 27@29c.; do. Welsh, Fall, 27@28c.; Welsh tubs, fair, 20@23c.; other grades of State, 18@22c.; Western Reserve, choice, 21@22c.; Western fair to good, 15@15c.; common, 10@11c.; grease butter, 7½@8½c.; Slate dairies, 27@30c.

Cheese.—The market has shown very slight changes the past week. The home trade has been fair, and, added to a moderate export trade, the stocks have been slightly reduced. It is the impression that the make this Fall is liberal and is being held back. The firm tone of the market in the interior, with favorable news from abroad, create a very steady feeling in this market.

We quote State factory, choice, 11¾@14¾c.; good to prime, 13¾@14c.; fair, 12¾@13¾c.; State dairy, 13@13½ for good to prime, 12@13c. for fair lots; for Ohio factory, 13½@13¾c. for good to prime; English dairy, prime, 13¾@14c.; fair do., 11¾@13c.

Cotton—Has been steadily advancing under a good export trade. We quote:

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	16¼	16⅝	16¾	17⅛
Good Ordinary	18⅝	19	19⅛	19⅝
Low Middling	19⅜	19½	19¾	20
Middling	19⅞	19⅞	20⅛	20⅜
Good Middling	20¼	20⅜	20⅝	21⅛

For forward delivery the market is firm at 18¾c. for Nov.; 18⅞c. for Dec.; 19c. for Jan.; 19¼c. for Feb.; 20¼c. for March, on the basis of low middling.

Dried Fruits.—Trade has been slow the past week. Peeled peaches are hardly so firm with better supply. No further changes are made in prices.

Southern apples, 3¾@4c.; do. sliced, 8@9c. Peeled peaches at 14@17c. for Ga., 11@15c. for Va., and 17@22c. for North Carolina. Unpeeled peaches at 5c. for quarters, and 3@3½c. for halves. Cherries, 22½c. Plums, 14@19c. Blackberries, 9@9½c. Plums, 11@15c.

Eggs.—The market for fresh is higher, with considerable and lighter arrivals. Sales of Western, at 28@29c., State, Pennsylvania and Jersey, 30@31c. Limed, 24@25c.

Flour.—Prices are without quotable change. The home trade has been fair with a moderate shipping trade.

Superfine State	$6 00	@	6 45
Common extra do	7 00	@	7 20
Good to choice do	7 25	@	7 45
Fancy do	7 50	@	7 90
Superfine Michigan, Indiana, Ohio, Iowa	6 00	@	6 40
Extra do	7 00	@	7 40
Choice extra do	7 45	@	8 20
Shipping brands round hoop Ohio	7 15	@	7 45
Trade brands do	9 50	@	9 75
Good to choice white wheat extras	8 20	@	9 55
Fair to very choice extra Minnesota	7 75	@	9 50
Common to fair extra St. Louis	7 10	@	9 20
Good to choice do	9 25	@	11 25
Extra Southern	7 45	@	9 75
Good to choice do	9 80	@	12 00
Rye, common to fine	4 35	@	5 35
Corn meal, Western	3 40	@	3 75

Fresh Fruits.—Steady good prices have enlarged receipts of apples, and a good many common grades have again clogged the market. Fancy and Winter sorts, however, are quite firm in anticipation of an early resumption of the demand. Of fancy pears Bucliess are the most abundant, and few are rated above $12, though some choice State stock is held higher. It takes so long for this variety to ripen right that the ordinary trade will not carry many of them. Grapes are reduced to few varieties and are firmer. Quinces are slow of sales as yet, they will have to drop before they will open into activity. Cranberries are steady. Chestnuts have declined largely but are on the turn for improvement.

We quote:—Apples, prime, $2.50@2.75; mixed, $2.12@2.37; fair, $1.25@1.75; common, $1. Pears.—Fine Duchess, Seckel, Louis Bonne, Virgalieu, B. Diel, $12@15; rough lots do., $8@10; cooking, $4@7, which is better. Grapes.—Concords, 7@10c.; Isabella, 7@8c.; Catawba, 9@11. Cranberries, per prime, fine, $3.50@3.75; other, $2.75@3; bbls., $12@12.50 for Cape and $8@11 for N. J. Chestnuts, per bush., $3@3.50. Hickory nuts, $1.75@2.

Grain.—Good and prime grades are wanted at a trifle better figures. Common stock is plenty and in the buyers favor. We quote No. 2 Spring $1.50@1.51; No. 1 do., $1.63@1.61; Winter red Western, $1.58@1.65; amber do., $1.68@1.75; white do., $1.75@2.05. Rye is scarce, at 83c. for Western in store. Barley is lower; sales at 85c. for six-rowed State, $1.16 for Canada West. Corn is higher but closed weak, with a limited export trade; steamer lots of Western mixed 63½c.; sailing do., 64c. Oats are higher under smaller arrivals; sales at 42@45c. for black Western, 46@47c. new mixed do., 47@48½c.; for old mixed do., 48@52c. for new white do.

Hay and Straw.—The demand is fair at steady prices. We quote new shipping hay at $1@1 05; retail do., $1.35@1.60; salt, do., 55@80c. clover, 75@80c. Straw at $1@1.05 for long rye, 75@85c. for short rye; 70@75c. for oat.

Hops.—There is very little stock coming in, growers and buyers in the interior being far apart in their views. There is a very firm feeling here, as the supplies are insufficient. Brewers are buying for forward delivery.

New York, growth 1872, at 25@30c.; Eastern do., 25@30c.; Western do., 25@30c; Yearlings '71 nominal; Olds '70 nominal; Old Olds, '68-69 10@15c.; Bavarians, 35@40c.; English, 25@30c.

Poultry and Game—Plenty and lower.

We quote live.—Turkeys, Jersey, per lb., 17@19c.; do., Western, 16@18c. Ducks, Jersey, per pair, $1@1.50; do., Western, 75@87c. Geese, Jersey, young, per pair, $2.50@3; do., Western, $2@2.50. Dressed Spring chickens, Western, per lb., 17@18c.; do., Jersey, 19@22c. Turkeys, 20@22c. for prime State; do. Western, 18@20c. partridges, per pair, 65@87c.; grouse, do., 75c.; woodcock, do., 75@87c.; pigeons, flight, picked, per doz., $1.25@1.50; do., feathered, do., $1@1.25. Hares, per pair, 60@80c. Quail, $2.75@3 per doz.

Provisions.—There has been a sharp traffic in pork, and prices seem bound for the prophesied quotation of $16. There have been free sales for early delivery this month at $15.25@15.40, and a closing sale at $15.50. November has sold at $1 . Jobbing pork sells well at $15.50@15.40 for mess, $12 25 for newly inspected extra prime, $17@17.25 for clear. Prime mess nominal at $14. New beef has appeared, and barrels have sold in round lots on private terms. Old quoted as before. We quote $5@8 for plain mess in bbls.; $5@

10 for extra do; tcs., $12@16 for prime mess, and $17@20 for India. Cutmeats are firm at quotations. Smoked hams, 15¼@17c.; do. shoulders, 7¾@8¼c.; pickeled shoulders, 7c., do. hams, 13¼@14½c.; clear ribs, 7c.; pickeled bellies, boxed, 8¼c.; dry salted hams, 1c. Bacon is higher for long clear, quoted at 9¼c. cash. Stretford is in demand at 9c. Forward bacon is in fair demand at 8c. for short clear and long do. for Winter months. For Jan., short clear alone, 8 1-16c. Lard fairly steady at 8¾@8¾c. for Western contract steam. City quiet at 8¼c. Beef hams are easier, and quoted at $.6.

Seeds.—Sales are of small lots. Timothy is selling at $3.75. Clover at 9¾c. for Ohio, 10¼c. for Indiana and Michigan, and 10¼c. for State. Rough flax is dull, quoted at $1.35.

Sundries.—Small lots of honey quoted at 20@28c. for dark and 25@30c. for light, in glass boxes; mixed lots, 21c. Cider plentiful, at 6@10c. per gal. Feathers, live geese, new, fine, ₱ lb., 60@70c.; do. mixed, 40@50c.; hen, 75@90c; vinegar, cider, ₱ gal., 20@25c.; do. manufactured, 15@20c.; newspapers, ₱ lb. 4@1¼c.; white rags, 5@5½c.

Tobacco.—The market is strong, with stocks steadily decreasing.

QUOTATIONS—NEW CROP.

	Light Grades.	Heavy Grades.
Lugs	9½@9¾c.	9¾@10¼c.
Common to medium leaf	10 @10¼c.	10¼@11¼c.
Good do.	11 @11¾c.	11¾@12½c.
Fine do.	11¾@12½c.	13 @14 c.
Selections	13 @11 c.	15 @16 c.

NEW CROP.

Connecticut and Massachusetts fillers	14 @16 c.
seconds	25 @35 c.
wrappers	40 @55 c.
selections	50 @75 c.
New York State running lots	12 @16 c.
Pennsylvania assorted lots	18 @25 c.
Ohio running lots	12 @16 c.
Ohio wrappers	16 @30 c.
Wisconsin and Western	9 @10 c.

Vegetables.—Potatoes are held firmly at late prices. The supplies are small.

Early Rose, bbl., $1.75@2.12; Jackson White, $1.50@1.75. Peach Blows, $2.25@2.50. Tomatoes, 75c. Squash, per bbl., $1@1.50 white and yellow. Cabbages, $8@10. Onions, red, ₱ bbl., $2.75@3.00; yellow, $3.25@3.50. Sweet potatoes, $2.50@3. Pumpkins, $7@8. Garlic, per 100 bunches, $16@18. Russia turnips, ₱ bbl., $2.50@3.

Whisky—Is dull at 92c. for Western.

Wool.—The market is depressed, with scarcely any trade. We quote fleece at 50@55c. for New York and Michigan; 52@59c. for Ohio; 50@55c. for Indiana and Wisconsin; 47@53c. for Illinois; 50@55c. for Texas, fine; 30@35c. for do. coarse. Pulled, 50@60c. for extra.

COUNTRY CHEESE MARKETS.

Little Falls, N. Y., Oct. 19, 1872.

THE market at Little Falls for the week ending Oct. 19th was active, and prices firm. About 750 boxes of farm dairies were delivered and sold at 13@13¾c. In factories the offerings were upward of 10,000 boxes, about 6,000 of which changed hands. It was expected that 14c. would be reached for fancy factories, but buyers were unwilling to make that point, holding that 13¾c. was top price. We give the leading transactions as follows:

Bates	14¾	Klock & Nellis	14¾
Bethel	14¾	Lasselsville	14
Brookman's Corners	14¾	Ladue	14
Charleston 4-corners	14¾	Middleville	14¾
Charleston Union	14¾	Mohawk	14¾
Christman	14	Newport	14⅝
Dunkle	14	Norway Ass'n	14¾
Empire	14¾	Paine's Hollow	14
Euphrates	14	Royder	13¾
Fairfield Association	14¾	Sand Hill	14
Old Fairfield	14¾	Shale Hill	14¼
North Fairfield	14¾	St. Johnsville	14
Freeman	13¾	Van Hornsville	14
Henderson Home	13¾		

Butter comes in more freely, but complaint is made that it lacks solidity. Sales were made of good fresh, in Welsh tubs, at 26@27c.

We have advices from abroad for the first week in Oct. Our London correspondent says there is more doing in English Cheese, and that useful American sells at a reduction. Extra fine, none in market; fine is quoted at 100@102s.; good, 88@98s. Other descriptions of cheese sell as follows: English Cheddar, 74@84s.; Wiltshire double, 62@72s.; Cheshire medium, 54@64s.; fine, 71@80s.; Scotch, 68@70s. Dutch cheese:—Edams, 56@58s.; Gouda, 48@58s.; Derby shape, 54@60s.

The transactions in butter have been large and the market firm. Clonmells, 124@128s.; Corks, 118s.; Normandy, extra, 148s.; Canadian, 95@100s. The corresponding prices last year were, for Clonmells butter, 130s.; American cheese, 60s.

The weather in Herkimer, N. Y., is cool and showery, with no frosts as yet to injure grass.

LIVE STOCK MARKETS.

NEW YORK, Oct. 19, 1872.

IT has been a bad week for dealers in live stock of all descriptions. The stronger tone noted toward the close of last week gave way on Monday to decided weakness and a downward tendency for beeves, sheep, lambs, hogs; and the markets have been dull and unsatisfactory throughout the entire week.

RECEIPTS OF LIVE STOCK,

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.
Totals this week	10,226	74	2,418	29,816	43,010
" last week	9,009	65	2,432	25,971	40,09
Average last year	7,187	88	2,301	25,133	25,177

Beeves.—The receipts were 1,217 in excess of the previous week and 1,822 greater than the average per week last year. More than one-fourth of the offerings were Texans, and the native steers were mainly of ordinary and common quality. Prices ruled lower for all grades, but smooth, fat native were scarce and could be sold at fair prices. The Texans were sold at 7¾@8¼c., and natives at 9@13¾c. Since Monday the offerings have been 3,500, and sellers have endeavored to advance prices a fraction, but thus far without success. The opening of the packing season at Chicago, Kansas City and other Western points will tend to lessen our receipts of Texans and common native steers, and dry cows; and may relieve this market of a portion of the undesirable stock which of late has been the chief cause of depression and weakness.

The following are the closing prices for the week in comparison with what cattle brought one week ago, for net weight of beef:

	This week. Cents.	Last week. Cents.
Choice beeves, ₱ lb	13½ @ 14	14 @ 14½
Good to prime	12 @ 13	12½ @ 13¼
Medium	10½ @ 11	11 @ 11½
Poorest grade	7 @ 9½	7½ @ 10½
Average sales	11 @ —	11¼ @ 11¾

Milch Cows.—Receipts were 74 head, and the market has been very quiet, with no change in prices. Common to very good cows were sold at $35@70, a few choice to private parties at $75@85.

Calves.—Milk-fed have been unusually scarce, and with a fair demand prices have been advanced a fraction, closing firm at 7@11c. per lb. for coarse to prime. The moderate receipts of grass calves have been readily sold at $6@10 per head for ordinary to good lots, and $10.50@12.50 for fleshy grassers and partly fed calves.

Sheep and Lambs.—The over-supply and consequent weakness noted at the close of the market last week, has continued, and while the extreme range of sales remains the same as for several weeks, viz.: 5@7c. per lb. for sheep, and 6½@8¾c. for lambs, all ordinary and medium sheep, which make the bulk of the supply, must be sold at a marked decline.

Hogs.—The market, which closed firm last week, further advanced for a couple of days, and then fell off, and closes weak 5¾@5¾c. per lb. for live hogs, and 6¾@7¼c. for dressed.

LATEST.—Monday, October 21, 4 P. M.—Beeves.—Fresh offerings to-day and Sunday were 328 cars, or 5,697 head. Prime cattle, both natives and Texans, were a little firmer, some of the best native steers selling at 14¼c., and an eighth car load lot of fine Texans at 14½c.; but common grades were dull at previous figures.

Sheep and Lambs.—To-day's receipts were 10,170, and trade was slow at 5@7c. for sheep, and 6½@8¼c. for lambs. Scarcely any sheep selling for more than 6¾c., and but few lambs for more than 8¼c.

Hogs.—Arrivals yesterday and to-day were 175 cars, or 18,053 hogs, and the market opened with an easier feeling at 6¼@7¼c. for dressed hogs, and 5¼@5¾c. for live.

SPECIAL NOTICES.

RUPTURE CAN BE CURED

without suffering. ELASTIC TRUSSES are superseding all others. Before buying Metal Trusses or Supporters, send for a descriptive circular to the ELASTIC TRUSS CO., No. 683 Broadway, New York.

ESTABLISHED 1837.

FASHIONS FOR WINTER.

1170—SCOTIA. The Polonaise is one of the latest Paris novelties. It contains many styles of trimming, but the one here illustrated is the most elegant. Without looping, it can be worn as long, tight-fitting basque, or draped (as shown in cut), it is a most elegant Polonaise. The ornamental bulk piece, passing over the shoulder, and forming a pearl-pointed front, adds to its stylishness, and may be worn or not as fancy dictates, thus constituting two entirely different Polonaises in appearance. The back panel is sometimes made in velvet or satin, and richly trimmed and completes a brilliant toilet when worn with a house dress. Braid is in beautiful variations, but we would adopt to any material. Take six yards of twenty-four-inch goods. Price of pattern, with cloth model, ONE DOLLAR. See GRAND PREMIUM below.

1133—DOLMA CLOAK. Needs no lengthy description to win universal favor. For comfort, neatness, and elegance combined, its equal is not to be found among the novelties of this winter's productions. Takes two and a half yards double-fold ladies' cloth. Pattern, with cloth model, 60 cents.

831—LA PIERRE OVERSKIRT. The latest, attractive and reigning style for making, in all kinds of material. And though for a season I plead so have refused, yet a spirit of change is quite evident, and we gladly accept this beautiful novelty which will grace if the wishes of thousands who desired to see overskirts again in high favor. Takes three yards thirty-inch goods. Pattern, with cloth model, 60 cents.

CONTRACTS TAKEN!

Rights for Sale.

AGENTS WANTED.

"EAGAN'S COMPOSITION."

(Patented March 5, 1867.)

Used in laying streets, roadways, sidewalks, in lining cellars, cisterns, vats, and in the manufacture of sewers and sewer-pipe, water-pipe, drain-pipe, gas-pipe, roofing and architectural ornaments.

STREETS.

Eagan's Improved Macadam pavement for streets is destined to take the place of all other forms of pavement, for the reasons, viz:

It is cheaper, more durable, more easily and perfectly repaired. Is impervious to water, and no atmospheric change will affect it.

It is free from mud and dust, and is noiseless.

It is smooth without being slippery, and has sufficient elasticity to make it the easiest pavement known for animals to travel over.

DURABILITY.

The reason a Macadam road does not last longer is because the stones are loose and rub and grind upon each other—dust and mud is the result. Eagan's Composition holds the rocks firmly together, thus completely remedying this evil, and confining the wear of the road to its surface.

SIDEWALKS.

Eagan's Composition is peculiarly adapted for sidewalks and lawn walks, private roadways, gutters, etc. It can be made into blocks and laid in square or diamond form, or made one continuous sheet, covering arched work more perfectly than the largest flagstone, and at one-fourth the expense.

Walks made of it have a smooth, hard and even surface, pleasant to walk upon, always clean and free of ice, and of as great durability as if made of the best flagstone. Sidewalks made under Eagan's patent cost but little if any more than if made of plank, and are as durable as rock.

ROOFING,

Made of this composition, is far superior to the common felt roofs that are made of gravel, felt, coal-tar and pitch. The latter is liable to run in warm climates and to crack in cold. By the peculiar chemical combinations in this composition both of these objections are obviated, and a roof produced equal to slate, at a cost of about one-third as much per square.

CELLAR BOTTOMS AND SIDES,

Lined with this composition, from one to two inches thick, keep perfectly dry and warm in winter and cool in summer, and are rat and vermin proof.

FLOORS.

Floors made of it may be painted any color; and are as pleasant to tread upon as if made of wood.

CISTERNS AND VATS.

Eagan's Composition is impervious to water and insoluble in acids, making it just the thing for lining vats in breweries and manufactories of most kinds. It is equally well adapted for cisterns, much better than the best hydraulic cements, and not subject to decay from any cause.

PIPING.

Piping made of Eagan's Composition has been in use for five years in San Francisco, Cal., where it was first invented. It has given entire satisfaction, almost entirely superseding all other kinds of piping for sewers or drains. It is easily and cheaply made, and has the advantage of being made at any place without a great outlay of money for machinery, tools, buildings or materials.

Pipes can be made of any required size, are cheaper, and will sustain a greater external or internal pressure than any other kind of cement pipe.

CEMENT.

As a cement it is acknowledged, by scientific men who have examined it, to be the strongest known. A wall built of brick or stone, and this cement used as a mortar, would be perfectly solid as if made of a solid rock.

SEA WALLS.

Sea walls can be built with this material in combination with broken rock, more rapidly and cheaper than in any other way

DIPLOMAS.

First premiums have been awarded to Eagan's Composition from the following Fairs:

California State Fair, at Sacramento, Cal., 1868.
Mechanics' Institute Fair, San Francisco, 1868.
Sonoma County Fair, at Petaluma, Cal., 1869.
St. Louis Agricultural and Mechanical Fair, at St. Louis, 1869.
New Jersey State Fair, 1870.
It has been exhibited at no other Fairs.

RECOMMENDATIONS.

OFFICE OF UNION RAILROAD COMPANY,
ST. LOUIS, MO., 25th March, 1871.

This specimen of Pacific Concrete, (Eagan's Patent,) was taken from the Union Street Railroad of St. Louis, Mo., where it has been in use since December, 1869. Since that date the teams of the railroad have passed over that portion of the track where the concrete is used, 300 *times each day*, while that same portion of the track is constantly used by other teams and vehicles of the city. This pavement has received no repairs whatever, and shows but little wear after constant use for sixteen months (now 22 months). In summer it is free from dust, and in winter brings with it no inconvenience from snow and ice. The Macadamizing at either end of this block of concrete is renewed three times each year, is soft and wet when much water is used, and in all probability will require such renewing for several years to come before the concrete needs repairing. The block of Pacific Concrete in the track of the Union Railroad has given entire satisfaction. WM. STORK, Sup't.

This Company will take contracts in any city of the United States to make Macadamized Pavements, and will guarantee them to last twenty years, and keep them in repair for a small percentage. Will also supply orders for Drain, Sewer, Water and Gas Pipe. Roofing for sale.

SAM'L N. PIKE, Pres't.

TO INVESTORS.

To those who have funds to invest in large or small amounts, or who wish to increase their income from means already invested in other less profitable securities, we recommend, after full investigation, the Seven-Thirty Gold Bonds of the Northern Pacific Railroad Company. Bearing seven and three-tenths per cent. gold interest, (equal now to 8¼ currency,) and sold at par, they yield an income considerably more than one-third greater than U. S. 5-20s. They are Coupon and Registered, the lowest denomination being $100, the highest, $10,000.

Nearly one-third of the Main Line of the Road will be completed and in operation with a large business the present season. All the property and rights of the Company, including a most valuable Land Grant, averaging about **23,000** acres per mile of road, are pledged as security for the first mortgage bonds now offered.

All marketable stocks and bonds are received in exchange at current prices. Descriptive pamphlets and maps, showing Route of road, Connections, Tributary Country, &c., will be furnished on application.

THE WOODWARDIAS.

AMONG the many kinds of ferns cultivated in our gardens, few are more ornamental than the *Woodwardias*, and of these *W. radicans*, the subject of our illustration, is one of the handsomest. It is well adapted for conservatory decoration, especially as a center piece for a vase, on account of the broad, graceful, arched manner in which the fronds grow, and in baskets or on projecting peaks of rockwork it is also equally pleasing. The fronds, as may be seen, are viviparous at the points, a circumstance of which advantage is taken when young plants are wanted. All that is necessary is to take a frond that is furnished with a number of these embryo plants and lay it on the surface of a broad seed pan filled with peat and sand in about equal proportions. Peg down the frond quite flat on the mold, keeping the upper surface still upwards, and sprinkle a little silver sand over the whole. Do not, however, bury the frond, but on the contrary, let the sand just nestle about the axils of the pinnæ and the base of each young bud. The whole must be kept moderately moist and the young plants will strike root. Some sever the fronds from the parent when about to propagate in this way; but the surest plan is to allow them to remain till the young plants have struck root.

A close frame or gently-heated pit is the best place in which to strike plants in this way, and as soon as the young plants have become established, with a sharp knife cut the frond into several pieces, and after a week or two cut it into as many pieces as there are plants, preserving to each only a very small portion of frond. After this allow the plants to remain some days longer undisturbed; then lift them out carefully one by one, pot them singly into thumb or small sixty-sized pots, according to their size and strength, and treat them as you would young ferns raised from seed.

Another species quite as useful as *W. radicans* is *W. orientalis*—a charming fern for cool conservatory decoration, and having fronds of a somewhat paler shade of green than those of radicans. Both kinds are hardy in the south of England; but when afforded the shelter of glass, their growth is much more satisfactory. In a cool fernery the fronds of *W. radicans* not unfrequently acquire a length of eight or ten feet. Those of *orientalis* are rather shorter, and bear on the upper surface a profusion of little bulbiform plants. *Woodwardias* like a loamy soil, and as a rule, succeed best when they are planted out.

For furnishing bare corners of houses or indoor vases in winter, nothing can be more suitable than either *W. radicans* or *orientalis*; and even the bare brow of a rockery may be clad in lovely verdure by planting a large *Woodwardia*, of either of the kinds just named, near the objectionable spot, and spreading the fronds over it in such a manner that the young plants at the ends of the long shoots may strike root and establish themselves where wanted. *Woodwardias* when in pots are also useful for brackets or for temporary room decoration on pedestals. *W. areolata* is a fine North American species, perfectly hardy; but, like the two kinds just named, well deserving of a place in a cool house. *W. virginica*, another North American kind, is also hardy, and when well grown, very handsome. Its fronds, which are of a pale green color, are thrown up from an underground stem to a hight of from one to two feet. To these may be added an evergreen Japanese species, (*W. japonica*), likewise a distinct and handsome fern for a cool house.—*Garden.*

GUNNERA SCABRA.

GUNNERA SCABRA.

OF late, our florist and landscape gardeners have searched all the out-of-the-way places of the world, as well as those of easy access, for plants that will give to our northern gardens a tropical appearance. The *Gunnera Scabra* is a plant well suited to this purpose, especially when large and fine specimens are secured. It is a native of South America, where it is known as Panke; the leaves and stalks being of a subacid flavor, they are eaten by the natives, and the roots are used for tanning leather. The leaves grow to an enormous size, measuring, in some instances, nearly eight feet in diameter. Their general form is round, but deeply indented on the margin. The accompanying illustration shows a plant in fruit. The great fleshy axis in the center is covered over with finger-like succulent cones, which are dotted with very small fruit. The plant fruits quite freely in England in the open garden, and is said to be perfectly hardy in the gardens about London. It would probably require protection in this country, the same as our *Cannas*, *Caladiums*, and similar plants cultivated for their foliage. We hope, ere long, to see some fine plants of the *Gunnera* in our city parks and gardens.

WOODWARDIA RADICANS.

FLORICULTURAL NOTES.

How Shall I Winter Erythiena.—In a letter written by ROSE GERANIUM, in the RURAL some weeks ago, she speaks of having, among other Southern plants, the Erythiena or Coral tree. Would she be so kind as to tell me, through the columns of the RURAL NEW-YORKER, how she kept it through the Winter? I exchanged seeds with Mrs. NICKELS of Texas—made her acquaintance through the RURAL. Among other seeds she sent some Erythiena; only one seed came up; it grew rapidly; its leaves were so bright and pretty, and I anticipated great pleasure in seeing it covered with beautiful scarlet blossoms; but alas for human hopes! my anticipations were never realized. I took it up carefully in the Fall, put it in good soil in a large pot, and brought it in the house. Soon the leaves fell. I thought it might be the nature of the plants, so put it in the cellar, watered it once or twice during the Winter, and brought it up in the Spring, but it was dead. If I should ever get another I should like to know how to keep it.—FLORENCE B——.

Dried Ferns for Vases.—Dried in the ordinary way, between sheets of absorbent paper, these form excellent ornaments for vases and every kind of floral embellishment. The ferns look almost as well as when gathered, and some ferns, as the Adiantums, quite as well. They last for months, and, indeed, only become objectionable from deep coatings of dust.—P

Wild Tea Again.—The plant sent by a subscriber at Sussex, Wis., is the one known in the East as New Jersey Tea—*Ceanothus Americanus*. It was used at the time of the Revolution as a substitute for tea—the same as you say the first settlers in Wisconsin used; hence the name of New Jersey Tea, Wild Tea, etc., etc.

Dicentra for Winter Blooming in Rooms.—JAMES VICK strongly recommends the Dicentra for winter flowering in pots in rooms, keeping in flower a long time. It should be taken up and potted before hard frosts. The room should be rather cooler than common sitting-rooms.

Blue Hydrangeas.—M. J. DUROUSSET, in a letter to the *Revue Horticole*, states that he knows from experience that the admixture of coal cinders with the soil in which Hydrangeas are grown is sufficient to cause the production of blue flowers on these plants.

Cardinal Flower.—Please name the inclosed flower, and oblige—A SUBSCRIBER.

Lobelia cardinalis, or Cardinal flower, common along the banks of ditches and in low, moist grounds, generally.

The Horseman.

THE HORSE DISEASE.

Some of the Preventives and Remedies Recommended.

THE preventives and remedies for the horse disease which is afflicting horses all over the country are multiplying with great rapidity. We copy some of those which have come to our notice.

The symptoms in the New York stables are a cough, a running at the nose and general fever, with a strong disinclination for food.

In some stables tar is fed the horses by putting it on their tongues and making them swallow it, at the same time rubbing the throat with sweet liniment.

Steaming, by putting vinegar on a hot brick in a bag, and compelling the animal to inhale the steam, is another mode of relief adopted.

In Rochester, rest, warmth, a mild laxative, the free use of disinfectants, with liberal sponging of the nostrils and mouth, are regarded as the true remedies to be resorted to in all cases.

Taylor's Compound Horse and Cattle Food has been used in some of the stables, and is regarded valuable in all cases of cold and affection of the throat. It is given both in the feed and water.

Bromo-Chloralum, sprinkled in the stable, and the manger washed with it (diluted) to purify the air, and the mouth and nostrils washed with it to arrest the discharge and prevent the spread of the disease, is regarded excellent, both as a preventive and remedy.

About Rochester, where the disease has prevailed to such an extent that the street cars stopped running, the livery stables closed, and the country people come to the city only by steam, it is asserted that the only fatal cases are those in which bleeding has been resorted to.

It is stated that in England, where this disease is not uncommon, sulphur is used as a prophylactic, and is a certain cure. A few ounces of common sulphur are burned in a pan of coals five or six times daily, in the stables, so that every part shall become fumigated. The animals are, at the same time, well cared for and blanketed. It is asserted that this simple remedy never fails.

Mr. E. H. BOOMER, a homeopathic veterinarian, who has charge of the 2,000 horses belonging to the Third Avenue railway stables, regards this as an epidemic, and not an infectious disease. He states it to be a kind of diphtheria, which may cause the death of an animal in three hours. His treatment is to administer five drops of aconite and use plenty of purgatives, which cause the animals to revive from the comatose state into which they fall an hour after they are attacked. The aconite removes the spasms.

Dr. E. MINK, a veterinary surgeon of Rochester, furnishes the Democrat of that city the following, which he calls an epizootic: "I think it cannot properly be regarded as a new disease. It is clearly a form of influenza that has occurred frequently in the United States, as it often has in different portions of Europe. Three forms of influenza are spoken of by veterinary authors—the catarrhal, rheumatic, and the gastro-erysipelatous form.

"The disease which is now seizing so generally the horses of this city is plainly of a catarrhal character. The first notable symptoms will be a flow of tears from the eyes, a watery discharge from the nose, and general languor. Next a cough, which, becoming more frequent, will soon occur in paroxysms. In the commencement the membranes of the nose will be found pale or of a leaden color, and those of the eyes presenting a yellowish or reddened appearance. Many cases are ushered on with a chill. All this is soon succeeded by a general feverish condition, manifested by heat of mouth, membranes of the eyes and nose reddened, pulse frequent, though soft and easily compressed, respiration quickened and sometimes laborious. At this stage the bowels may be sluggish, urinary organs inactive, and the discharge from the nose often assuming a yellowish or greenish appearance.

"The disease usually runs its course within ten days, and with proper treatment few if any cases ought to prove fatal. Those that do so are usually complicated with other diseases, as bronchitis or pneumonia.

"Treatment—The patient should be excused from all labor and allowed complete rest. The stables should be clean and well ventilated. Disinfectants may be useful and in some cases necessary. Either of the following will answer:—Carbolic acid, sulphate of iron, or bromo-chloralum. The patient should be properly groomed, and the nose and eyes frequently sponged with water, and the limbs, if cold, bandaged. The drink should have the chill slightly removed, but not enough to make it warm and unpalatable. The diet should be light and of a laxative nature; say short feed or bran wetted or scalded, with a little salt added. Hay in limited quantities may be allowed.

"In regard to remedies, I wish to say that heroic treatment should not be tolerated. Blood-letting, cathartic nauseants, and arterial sedatives are all of them either injurious or uncalled for. Next, whatever medicines are administered should not be given in the form of draughts or drenches, as the animal is sure to be thrown into a paroxysm of coughing the moment a drench is attempted, and some of the medicine will in such event be almost sure to find its way into the windpipe and bronchial tubes, thus inducing fatal bronchitis or pneumonia. Balls should not be given, as they will be coughed back or out, and the irritability of the throat will be increased in attempting to pass them over with the hand or fingers. Powders are well-nigh useless, as when mixed with the food the patient will usually refuse both food and powders. Electuaries, sirups or pastes are the only forms in which medicines may be safely and successfully administered in cases where the throat is tender and irritable and coughing easily induced.

"Saline medicines I regard as the most useful in this disease. Either of the following will answer: Chlorate of potash, muriate of ammonia, or hyposulphite of soda. As an anodyne to relieve the cough fluid extract of belladonna may be added. The proper dose of either of these medicines may be rubbed up with two or three ounces of honey or molasses, and these poured in the mouth from a small bottle or placed on the tongue with a spoon. Given in this way the medicine will be readily lapped up and easily swallowed. But little trouble is required to give it, and no danger of getting any medicine in the trachea will be incurred by this method."

Gen B. S. ROBERTS, U. S. A., writes that in 1868 a disease similar to this which now prevails, broke out at Fort Sumner, New Mexico:—At first it defied all treatment, and the great majority of horses attacked by it died. On examining the throats of the dead horses, I found the lining membrane of the larynx highly inflamed and thickened, and a thick mucous pus filling it, causing suffocation. I ordered all horses, on the first appearance of the disease, to be thoroughly rubbed between the lower jaws and along the larynx down the neck with spirits of turpentine, causing a very severe external irritation and blister.

I saved every horse thus treated, and in a very few days entirely broke the distemper and checked the epidemic.

I do not doubt that thousands of horses, where this epidemic prevails, can be saved by adopting this treatment. It acts more quickly as a counter-irritant than any other remedy I know, and relieves the fever of the membrane of the larynx in a very few hours. Besides, spirits of turpentine is always at hand, and can be more readily applied than any other counter-irritant. It should be thoroughly rubbed in through the hair to the skin, for a distance of some twelve or fifteen inches, under the jaws and down the neck of the horse, immediately over the larynx. The remedy is severe, and makes the skin sore for several weeks, and for an hour causes great suffering to the horse. But it acts promptly and effectively, and in my judgment it will be found the best, and perhaps the only cure for this fatal malady, ending such suffering and loss among horses throughout the country.

A. LIANTARD, V. S., says:—There is in the treatment of the present epidemic a very essential point to be taken into consideration which relates to the hygienic attendance of the affected animals. Rest, as soon as affected, is essential, as if the animal is kept at work the disease will progress and may prove fatal in a few hours. This is a part of the treatment I think veterinarians ought to insist upon very firmly. Good hygiene by the proper and comfortable temperature of the stables, blanketing according to the condition of the ambient atmosphere, bandaging of the extremities after a good hand-rubbing; wiping of the nostrils with vinegar and water is also recommended. Feeding of course requires much attention and careful handling, and warm gruels, scalded mashes, and oats mixed with flaxseed may be used. In a few cases roots, carrots, turnips, or fruits may be given, according to the condition of the bowels. I would also highly recommend proper ventilation, cleaning of the stables, of manure-pits, whitewashing of the stables, and the free use of disinfectants.

Field Crops.

SOILING CROPS.

MR. HARRIS LEWIS, at one of the recent State Fair Discussions, at Elmira, talked of soiling crops as grown in connection with grasses for dairy purposes. We copy from a report of what he said, which we find in the Country Gentleman:—In a true dairy district grass can be grown more cheaply than any other feed, but as an adjunct he had found *lucerne* to be the best of all soiling plants on land adapted to it. It likes best a sandy or light soil, and if there is water eight inches or so below it, so much the better. Its habit, too, is to monopolize the soil or leave it. Sown broadcast, it requires 18 lbs. per acre—in drills, from 10 to 14. He preferred broadcast seeding. It is highly relished by all stock animals, and will make four growths a year, each of two feet or more, and it can be cut as easily as rye. There is one piece of lucerne in Oneida County which had grown 108 inches in one season. It will not produce quite as much milk as some of the natural grasses, but nobody will object to the quality of the milk.

Next for soiling purposes, he prefers orchard grass. For convenience it had better be sown near the barn, on underdrained and subsoiled land. Sow at least three bushels per acre—better more than less. Fertilize near the surface, and not deeper than the cultivator will work it; make the ground rich—*very* rich—and seed in the fall. After the first year you can cut it twice, and after that four times, if you keep it rich. Surface manure—there is no danger from evaporation—he did not think it would exceed 2 per cent., at any rate. Cut before it fairly gets into blossom; if not, it quickly changes into woody, fibrous matter. On rich land, when well established, two feet of growth can be obtained at a cutting. It comes on, too, when the cows need it, and before you can get feed for them from fodder corn. Always cut before it blossoms, and if you don't need it just then, cure it for feed in the early Spring, and your second cutting will even yet be earlier than sowed corn. This first cured cutting will be *dried* grass, not "hay," and no cooking is needed to improve it, but some roots fed with it will supply all the succulence needed. He done better with the dairy in March in this way than any dairyman in Herkimer County.

From an experience of 25 years he had found that no roots equalled the American improved imperial sugar beet; it was a long name, but some of the roots grow long also. He had raised 44 tons to the acre, and it comes nearer to supplying the succulence of grass than anything he knew of, and at the cheapest rate. As to the amount to feed, he was governed in part by the character of the cows; a peck, on the average, does well, but some will take half a bushel.

Next to this sugar beet in value was the Yellow Globe, and for young stock, the Mammoth Red. He once bought a toothless old cow for $21, giving about two quarts of milk daily on a feed of hay and grain. He gradually changed her food to roots, (sugar beets), and in two weeks her yield rose to 50 lbs. of milk daily, and she made 700 lbs. of cheese that season, while the average in Herkimer county is less than 300 lbs. He kept the cow five years, in hopes to raise a heifer from her, but unfortunately her calves were "all of the other sex." He finally sold her for the same price she cost him, and on a change of feed she died soon after. But anybody else could do as well as he had done, and one point was to weed out all the non-paying cows in the dairy—and in a dairy of thirty, there would usually be several such constantly draining the profits from the good cows. Give them away, or hire some one to take them. Give your good stock all the good grass they will eat, furnish comfortable quarters, plenty of light and air, treat them as kindly as you would your family, and you may expect to do well. But it is cruel to feed old, woody, fibrous hay, which a cow cannot digest nor assimilate. Grass, grass, and plenty of it, is what your cow needs.

In answer to questions, Mr. LEWIS said the beets should be sown just as soon as the ground was in good order. They will not run to seed the first year, though carrots will. Can get a second growth of orchard grass by the last of June. Don't think frequent changes of pasture are good. Lucerne does not change rapidly to woody fibre. In seeding to clover he prefers the large kinds.

Mr. F. D. CURTIS preferred the small kinds of clover for pasture or hay. The value of grass was in its foliage, not in its stalks. The large kinds had few side stems or leaves until late in the season, a long and worthless stalk and a small head. For enriching the land the large kind is the best, as the roots go down in proportion to the top. But it does not start as early as the small kinds, and is wasteful for hay; it lodges, rots, and furnishes a mass of material of little use. As to orchard grass, it has great value for soiling; it will stand drouth better than anything he knew of, as it has a great mass of fibrous roots going down several feet. Still two cautions are necessary as regards meadows—it ripens too early to be grown with timothy, and when too ripe, it is almost worthless for fodder, and hence should be sown by itself, and cut by the last of May or first of June. For permanent pasture it is one of the most valuable grasses known; he had a field of ten acres, on which he had had to seed timothy and clover every other year, but it is now in orchard grass for the *sixth* year, and had yielded more this year than ever. The other caution is that it is a delicate plant to start. For a permanent meadow he had sown one bushel of clover seed, one of timothy and five of orchard grass; sow the last of August or first of September, and cover lightly. The clover and timothy will disappear after a few cuttings, and leave the orchard grass alone. About not changing pastures frequently, he agreed with Mr. LEWIS; he would regulate the number of cattle to the size of the field, and keep them there. He believed also in top-dressing; frequent surface manuring will even keep clover growing year after year. Ten years ago a piece of his farm was heavily dressed with sheep manure, and it was growing excellent clover now.

Mr. REEDER advocated seeding both kinds of clover at the same time, as more pasture would be obtained in that way.

Mr. HOFFMAN suggested the Spring seeding of grasses without seeding with grain. He had succeeded well in that way.

The Vineyard.

VINEYARD NOTES.

Plaster of Paris as a Manure for Vines.—I have a large quantity of grape-vines planted in the open ground, and trained on poles and wires along the gravel walks. In planting these I had the holes dug 25 inches deep; I then threw into each hole five or six lumps of old plaster of Paris, about the size of my fist. I threw a little earth over these lumps, and then planted the vines in the usual way. The result has been wonderful; the vines which were not half an inch thick when planted three years ago, are now two inches and more in diameter, and bear finely. The grapes are also freer from disease. Other vines, not so treated, are much smaller and produce less, the fruit being also more liable to disease. To try the effect of this plaster, in planting two American black Walnuts, we put plaster to the one and not to the other. The former grew twice as fast as the other. Last year we dug about the roots of the one to which no plaster was put, and we threw in seven or eight large lumps of plaster among the roots; the trees are now both of the same size, and though only four years old are 16 or 17 feet high.—P. P., *Italy, in Garden.*

"Sam Miller" Grape is a name given by Maj. FREAS to a grape which SAM MILLER says "is a hybrid, between Golden Chasselas and Concord; is hardy, vigorous, healthy and very productive, and I think good. There were *bunches a foot long*, but between birds, bees, wasps, hornets, etc., the bunches are all spoiled. I am convinced that I can grow it to weigh three pounds to a bunch." Maj. FREAS received specimens of this grape and says:—"The grapes sent us were too far decayed to pass an opinion upon them. Only two berries, the flavor of which had been much interfered with by the rotten ones, were left to give us any idea of the quality of the fruit. The color was a grayish-white, the fruit larger than the Concord, and so far as we could judge was pulpless, which is a great consideration. The quality we should say was at least very good, and the stranger seemed to promise well. If the vine should prove hardy, after additional trial, the bunches anything like promised size, and the productiveness and quality as claimed for it, we cannot see what is to hinder it from taking its place in the front rank of out-door grapes."

Dairy Husbandry.

CHEAP PROCESS FOR CONDENSING MILK.

I WRITE for information in regard to condensed milk. I wish to know if there is not a cheaper and simpler way of condensing milk than Mr. GAIL BORDEN'S patent? Cannot it be done by a pan setting in another, with water between them, on a good arch or furnace? The milk can be raised to boiling water heat. Is that hot enough to evaporate the milk in three or four hours? The pan can be made after the style of a cheese vat, to sit on a brick arch, and it will shut close enough to hold a good deal of the steam, and will raise the milk considerably above boiling water heat. What part of N. Y. State is the milk condensing factory?—JEROME RIMPH, *Tilsonburg, Oxford Co., Ont.*

BEING desirous of starting a milk condensing establishment we would like to procure the names of two or three condensing factorymen in your State. Also if there could be a good man procured to take charge of a factory. What length of time would it require to instruct a man that has a good practical knowledge of cheese making and is a good judge of milk, sufficient to run a factory? What amount of water is required and of what quality? What is your opinion about the markets taking any amount of good condensed milk?—E. C. COX, *Mesopotamia, O.*

WE think the plan adopted by GAIL BORDEN for condensing milk "in vacuo" the best that has yet been invented. After the milk is drawn into the vacuum pan, it is away from harmful influences. The process is more cleanly than other methods, and not so liable to make an inferior product.

Various methods have been tried from time to time for condensing milk. The one adopted by PROVOST of Orange Co. a few years ago, was to evaporate the milk in a pan which was set over water on a furnace. The bottom of the evaporating pan was corrugated. Immediately over the pan there was a chimney-like ventilator rising above the building, and in which were placed the revolving fans for expelling the vapor as it rises from the milk. The fans are driven by power supplied from the engine, and thus they carry off the water, forcing it through the ventilator out of the building, as fast as it is formed into vapor.

The leading features in the treatment of milk under this process are briefly as follows:—The milk as it comes to the factory is carefully examined, and if all right, it is received and weighed. The cans are then placed upon a car which runs on rails to the cooling vat. Here the milk is drawn into long tin pails, 8 inches in diameter and 18 inches long, holding twenty quarts each. About 18 quarts are put in each pail, which is then placed in the vat containing cold spring water. After the milk has been cooled to 60° the pails are immediately plunged into the water of the heating vat, which has a temperature of from 185° to 190° Fahr. The best refined white sugar is then added at the rate of four pounds for each pail. The pails are kept in the vat of heated water about thirty minutes, when the milk is drawn into the large condensing pan previously referred to. The temperature of the milk while evaporation is going on in the pan is uniform at 160° Fahr. Under this process it takes about seven hours to condense the milk, seventy-five per cent. of its original bulk in water being driven off.

The faucets at each end of the pan are then opened, and the condensed fluid passes through fine wire strains or sieves into large cans. These cans, when filled, are rolled away to the tables at the back of the room, where their contents are drawn off into small tin cans holding one pound each, and these are immediately sealed up to exclude the air.

This factory was in operation some eight or ten years ago, and we give merely the outlines of the process for condensing, to show our correspondent what has been done in this direction. Dr. CRAIN, who was the manager of the factory when we visited it, informed us that a fair quality of condensed milk could be made under this method of condensing, but from later investigations concerning the business, we are of the opinion that the process and machinery are much inferior to those invented by Mr. BORDEN. We cannot say but that machinery and apparatus more simple and less expensive than BORDEN'S, may yet be invented for condensing milk; but we should not advise persons to engage in the business of manufacturing with experimental machinery or experimental processes.

We do not say this to discourage experimentors or inventors. On the other hand we should be glad to have the process and machinery for condensing milk simplified and cheapened, believing that a prime article of such milk is a great blessing to city consumers. Under the BORDEN process a very superior milk has been put upon the market, and until other processes furnish that of equal quality we must regard his plan as the best, though somewhat expensive and complicated.

We should say that it would require a longer time to learn the art of milk condensing than to learn cheese making. To a man well acquainted with the handling of milk, as referred to by Mr. COX, we should say that one season's practice at a condensing factory might be sufficient to learn the business.

An abundance of good, cool water is required at the condensing factory—more water, we should say, than at a first-class cheese factory for the same number of cows.

The market for condensed milk is at present limited, but as the article becomes better known to consumers the demand for it, we have reason to believe, will be extensive.

In regard to markets and the present demand and supply, we must refer our correspondent to the New York Condensed Milk Co., N. Y. City, which can probably give the desired information.

DRIED CREAM IN BUTTER.

I NOTICED in the RURAL NEW-YORKER, some time ago, that Mrs. L. W., Clayville, N. Y., was troubled with dried cream in her butter. I have not seen any answer that is satisfactory to me. Would like to tell her and others my views. I think the cause too much air, or a current of air which dries the cream while it is rising. Have observed this same effect in my own milk. If a pantry off the kitchen must be used through the summer for milk, it should be kept nearly closed and darkened, as it will then keep more of an even temperature, taking pains to open it only when the air is coolest, say early in the morning. I do not think it possible to make good butter in warm weather, where the pantry is used as ours generally are, for all the table dishes passing from the heated kitchen to pantry, taking the heated air from a cook-stove into the pantry, and often hot victuals too. No person of sense and economy will practice it. I have seen a large cupboard, made and set in the kitchen for dishes, etc., where the means would not allow of any better way. A good cellar suits me the best in hot weather, and then I enjoy the time spent there, it is so cool. It does not matter how small the cellar is—only large enough for the milk—if it is well drained and clear, no decayed vegetables and no vinegar or old cider in it.

We used one several years, with no light except from the door, and that was kept shut when not needed. We made prime butter. I mention this because many people think they cannot make butter unless there is light and a draft of air, and so leave the cellar filled with rubbish all the Summer, and try to make butter in the pantry. I wish to say to those, try the cellar; clean it early in the Spring; drive away rats and mice; if they trouble you use chloride of lime in it a few times. When the warm weather comes clean again; be sure there is no decaying substance, and then try the milk there. I have found salt thrown over the cellar bottom to be excellent in keeping insects away; also wash milk racks with salt and water, to keep off the mold, and never open the cellar windows in hot weather. MRS. L. JENNINGS.

DAIRY NOTES.

A California Dairyman.—In the year 1855 or 1856, or thereabout, says the Grass Valley Union, we knew a man in Nevada City who milked two or three cows, and who used to walk around the town and sell lacteal fluid. He carried two cans on a wooden yoke, which was placed over his neck and shoulders. He has flourished since then, and now has lands and horned cattle down in Monterey County. He is now engaged in milking 1,200 cows, and he makes butter and cheese. Next Spring he will milk 1,500 cows. His cows are of excellent stock, consisting of Devon, Short-Horn and Alderney blood. The name of this successful milkist and ex-Nevada City man is S. C. ABBOTT. His property is assessed at $100,000, and we doubt much if he would sell out at that figure.

The Apiarian.

WINTER MANAGEMENT.

THIS is one of the most important subjects connected with the care of bees. Upon the success of the apiarian to Winter his bees without loss rests much of the profit or loss of bee keeping. The fact that thousands of stocks are annually lost during the Winter months is conclusive evidence that the great mass of people who keep bees have not yet mastered this part of the science. We believe that bees may be as safely wintered as any stock kept on the farm, and that this annual drain upon the pockets of bee keepers is, therefore, wholly unnecessary.

Those who have not examined their bees should do so at once and ascertain their exact condition. If a hive is found to be full of honey in the brood department, it may be greatly benefited by exchanging one or two frames for empty or partly filled ones taken from weaker swarms. This will equalize the honey so that all will have sufficient to carry them through the Winter. In some localities, however, where the season has been poor, some may still lack honey, and resort must be had to feeding. If you have no honey, a sirup made of coffee A sugar will answer every purpose. To twenty pounds of sugar add ten pounds of water and let it boil slowly ten minutes, skimming off all impurities that may rise in the meantime. Before taking it from the fire add one tablespoonful of cream tartar, to preserve crystalization. All swarms having less than twenty-five pounds of honey should be fed enough to make up the deficiency. In feeding, use some one of the improved forms of bee feeders. Having tried several devices for this purpose, we give the preference to the Beebe Feeder, as being the simplest, cheapest and best.

To Winter well, each swarm should contain at least two quarts of bees. By uniting two or more weak swarms all may be brought up to the required standard. Now that we have each swarm strong in numbers, with plenty of honey, let us see if they cannot be protected so they will all be ready for the honey campaign next season. Here is our plan:—If you use a honey-board, remove it. If any hive has not plenty of empty cells for bees to cluster in, remove one frame and place the others equal distances apart. Now get out four small strips of wood, half an inch square, for each hive, and large enough to reach across the frames. Place one across each end and the other two near the center, equal distances from the outside ones. Now we want a "honey-quilt," one for each hive. Here is our plan for making them:

Procure some factory cloth, the heaviest you can get, (we use Atlantic A) a yard in width; cut off a piece long enough so that when it is doubled it will be plenty large enough to cover the top of the hive; upon one-half of this piece lay two thicknesses of cotton batting, bring over the other half and lay upon it and sew it in place; (your "better half" will make them for you better than you can do it yourself;) now lay your quilt upon those little strips of wood we told you to put across the top of frames. Perhaps you would like to know of what particular value those honey-quilts are. They allow the moisture in the hive to pass off, thereby preventing the accumulation of frost therein; keep the bees warm, and enable them to pass from one comb to the other, and give upward ventilation, without creating a draft of air through the hive.

We now make a box (without top or bottom) large enough to set over the hive, leaving a three-inch space all around. It should be six inches higher than the hive. Now pack this space with dry shavings, cut straw, or other absorbing material, and lay a board over all to keep out rain and snow. Shade them well from the sun, and your bees are ready for cold weather.

If, at any time during the Winter, the weather be warm enough for the bees to fly, it is advisable to let them do so. Remove the boards that were set up to shade the hives, so that the sun's rays may strike them, and if there be any snow upon the ground around the hives, lay a broad board in front of each one. After the bees have ceased to fly, shade the hives, as before directed.

There are many causes of failure in wintering, not noticed above. A poor quality of honey will cause many swarms to perish if the bees are confined to the hives by long-continued cold weather. Late-gathered honey that is not sealed over, will produce the same results. The only remedy that has proven effectual in such cases, is to remove the honey with the honey-extractor, and feed sugar sirup in its place.

We have for years held to the doctrine that those swarms winter best that rear broods late in the season. Years of practical experience and observation have confirmed this belief. Very many of the best bee keepers of the country agree with us now. The bees may be induced to breed late in the season, by feeding a small quantity of honey to each stock daily. There may be those who will consider our plan of wintering too much trouble; but we should remember that whatever we do should be well done, if we expect to secure generous returns. HERBERT A. BURCH.

South Haven, Mich.

The Herdsman.

NEW JERSEY CATTLE DISEASE.

FREDERICK WALTMAN, Millville, N. J., writes the Farmers' Club that he has lost six head of cattle affected as follows:—The animal commences wheezing, and a slimy, watery discharge from the mouth, heaving in the flank, falling off in milk; the horns get cold, then warm, then cold again. The disease lasts two or three weeks. Toward the last the throat becomes sore, and they cannot swallow. No one present had had experience with this disease; but the RURAL NEW-YORKER believes it to be Bronchitis, which is not uncommon among cattle during the Spring and Fall months, especially where at all exposed to storms or the changes of weather.

For this disease, CLATER says "aconite is a valuable remedy when cautiously administered, but is generally unsafe, except in the hands of a practitioner versed in its action, and who can properly estimate how far its administration can be persevered with. It may be given in the subjoined form and combination:

Take of solution of acetate of ammonia	4 ozs.
Fleming's tincture of aconite	30 drops
Water	½ pint

Mix, and give immediately.

"At the end of about four hours the draught is repeated, having the dose of aconite reduced to twenty drops; and at the lapse of each succeeding period of four hours, ten drops are to be given with the same quantity of ammonia as prescribed. The aconite must be withdrawn as soon as the pulse is reduced and the symptoms denote greater quiescence, and half a dram of the extract of belladonna substituted; the draught being administered twice a day only.

"At this stage, but not a moment sooner, the lower part of the neck, breast and sides behind the elbows, may be dressed with a mustard embrocation. Active blisters during the existence of acute disease of important organs, are among the most baneful and effective destructive agents that man can devise.

"If the cough proves troublesome, the addition to the draught already given of one or two drams of the powdered ipecacuanha, or an ounce of the oxymel of squills will be found to possess powerful effects in reducing the irritation. On the appearance of a copious expectoration of purulent discharges, reduction of the cough, pulse and temperature, the following draught may be given morning and evening:

Take of solution of acetate of ammonia	2 ozs.
Aromatic spirits of ammonia	½ "
Or spirits of nitric ether	2 "
Infusion of columbo, quassia or gentian	2 "
Tepid water	1 pint

"This being continued three or four days, and the appetite restored, half a dram of the perchloride of iron may be mixed with half a pint of water incorporated with a feed of oats, with oat or barley meal or bran, morning and evening for six days, when the animal may gradually be brought to his accustomed food and habits."

NOTES FOR HERDSMEN.

Cow Giving Bloody Milk.—Is there any remedy for a cow in the following condition? Last June she failed to give milk from one of her teats—cause, garget—and now, within two months, she has given bloody milk out of the opposite teat. She is three-fourths Alderney; her age four years. If there is no help now, will there be when she comes in again?—O. D. CASE.

WE should physic her thoroughly—giving her poke root once or twice a week—and keep her on light, cooling food—mashes and vegetables. We cannot speak of her future with any certainty, never having had experience in a similar case.

Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

My Potato Crop.—*Oct.* 15.—Years ago I raised potatoes for market, but of late only enough to supply my own family and those of my workmen. I have noticed for several years past that the less the space planted the greater the proportionate yield; consequently, my half-dozen rows give me almost as many bushels as a half acre did several years ago. In my vegetable garden I planted, last Spring, four rows, 110 feet long each, of Early Rose, thinking that this number would answer for digging early; and so they did; and I find that I have a barrel and a half left. John said that he would plant a few rows of Peerless in the cornfield for late, and four rows of this variety were put in, the rows being a little longer than those in my vegetable garden. To-day they are dug, and the yield is six barrels of as handsome potatoes as one would wish to see. Now, this yield would be nothing remarkable on good, rich soil adapted to the culture of this vegetable; but upon my light, sandy soil, that has been cultivated for a century, and was considered worn out and valueless when I purchased it, the result is somewhat marvelous, especially to my neighbors, who are to the manor born. My method of culture is, however, no secret, it being merely the condensation plan—that is, manuring the land heavily as far as you go, allowing the remainder to lie idle if it cannot be enriched. The quantity of barn-yard manure used upon those six rows some of my neighbors would have considered sufficient for a half acre of similar land, and they would have spread it over that space, and in the Fall obtained no more potatoes than I have from my six short rows.

In preparing the land for planting, I have two furrows plowed, throwing the soil outward with both, thus leaving a wide trench, six to eight inches deep. Into this trench, and along its sides, we scatter fine, well-rotted barn-yard manure; on heavy clay soils I would use fresh manure; but on my light sand it is too heating, and leaves the soil so light that the crops are liable to suffer from drouth. After the manure is spread, a one-horse plow is run through the center, or a little on one side of the trench—very lightly, or just deep enough to mix the soil and manure together.

I use large, well-ripened tubers, for seed, and cut them into four or more pieces, as my own experience leads me to believe that farmers use far too much seed, and that a large tuber cut up into several pieces is far better than small ones uncut. These pieces are dropped twelve to fifteen inches apart in the center of the trench, and covered with a one-horse plow. I obtain a far larger yield by this drill system than I ever did by the hill system, and find that my deep culture and deep covering is almost a sure preventive against failure on account of severe drouth. Four years ago I sold one-half of my farm, and expended the money obtained in improving the remainder, and I am not quite sure that another division would not result in an increase of products as well as profits. The average yield per acre of any one of our staple crops is conclusive proof that a slip-shod system of culture is the rule, and the reverse of it an exception.

Roses from Seed.—*Oct.* 16.—A lady correspondent writes me to tell her, through the RURAL NEW-YORKER, how to grow roses from seed. Of course I cannot refuse such a request, coming from a lady and a stranger, although I must confess, Mr. Editor, that one's hiding behind a "*nom de plume*" does not entirely protect him from the assaults of the people. Every time I call at the RURAL NEW-YORKER office I find a pocket-full of letters addressed to the old gentleman (myself) who has a "Daily Rural Life." Of course I am not so old as to have forgotten my gallantry to the ladies, and some of the pretty little notes received from them almost make me wish I was young again. But this is not telling how roses are grown from seed. Few of our very best double roses produce seed; for the organs necessary to its production are either changed to petals or so crowded that they are deformed and cannot perform the functions for which they were designed; but an occasional flower on most of the varieties will produce a few seeds, and these should be gathered when they are ripe, allowing them to remain in the pods or "heps," as they are usually termed by rose growers, until wanted for planting. If a number of the heps are put into a box and kept moist, they will soon decay and allow of a ready separation of the seeds. As soon as the seeds are separated from the pulp, sow in the open ground or in boxes six inches deep, filled with rich leaf-mold or other light, rich soil. The seeds should not be covered more than one inch deep, and always with soil that will not become so hard and compact as to prevent the young plants from breaking through it. If the seeds are sown in the open ground, select some half shady border for a seed bed, and be sure to get the seeds in before the ground freezes. When sown in boxes, of course the operation may be delayed until mid-winter, or even later if necessary. Mice are very fond of rose seeds, and it is always a safe plan to keep the vessels containing such seeds carefully closed. It is frequently the case that the seeds will not germinate until the second year after sowing, although a portion may appear the first; therefore it is not best to neglect the seed-bed or boxes if no plants should come up the next Spring after sowing.

When the young plants do appear give plenty of water and keep free from weeds; in other words hasten growth in every manner possible. If the varieties grown are of some tender species like the Bourbons and Teas, the young plants should be taken up in the Autumn of the first season, and either put in pots or otherwise protected. They should also be cut back to within two or three buds of the base at the same time, as this will make them produce far more robust shoots, and insure blooming much sooner than if allowed to go unpruned.

There are varieties which are called shy bloomers on their own roots, but when budded or grafted upon strong stocks, bloom quite freely; and by adopting this system, nearly all seedling roses can be brought into bloom the third year. I wish our American ladies would take a little more interest than they do in the culture of flowers, even to the raising of new seedling roses.

Patching Evergreens.—*Oct.* 19.—Last Winter many of my evergreens were killed outright, and others only badly scorched on one side, or just enough to spoil their beauty. In some instances one entire side would be killed and the other remain fresh and uninjured. For a while I was at a loss to know what to do with these half-killed specimens; but it occurred to me that if the two halves of separate trees that were alive could be placed together, perhaps a good specimen would be the result. Of course with very large trees this would be entirely impracticable; but with Arborvitæs, Junipers, and similar evergreens, that were not more than six to eight feet high, it might be done, and I gave the thing a trial and it worked well. All the dead branches from the injured side were cut off close to the stem; also the roots from both the specimen to be patched and the one used as a patch, and the two planted together as one tree. Where only a few of the lower branches were killed on a large specimen I patched them by planting small trees to fill up the vacant places. I have just been looking over this patchwork among my specimens and find most of it a decided success. I recommend this practice to those who have injured evergreens.

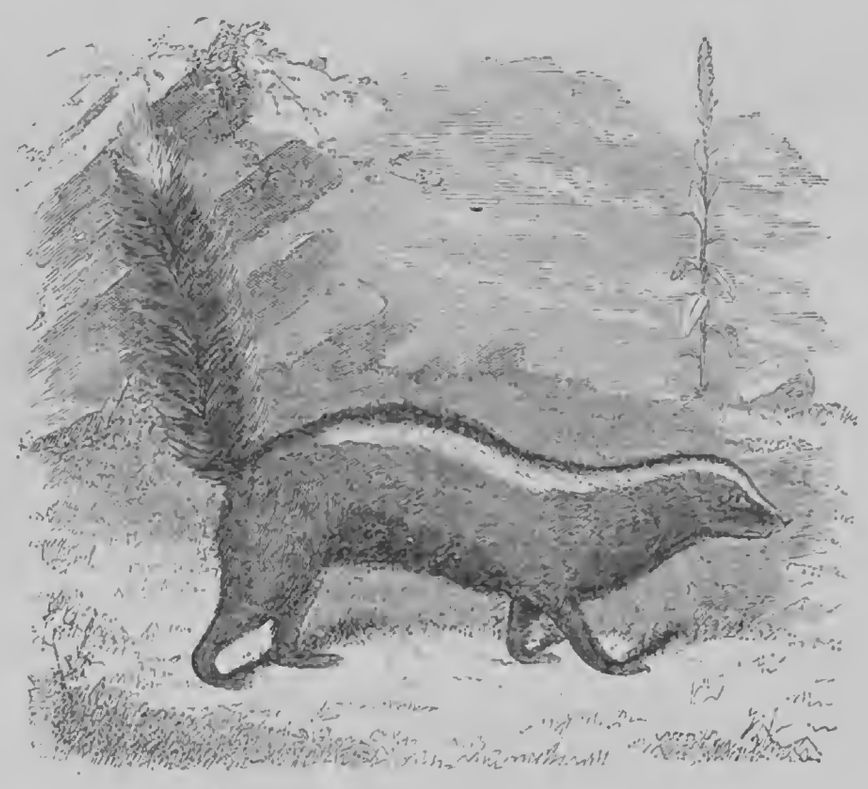
The Naturalist.

OUR FUR-BEARING ANIMALS—V.

COMMON SKUNK.

(Mephitis Chinga—FREIL.)

THE skunk is exceedingly abundant in the Eastern and Middle States, and is not unfrequently met with in many of the other States; and it is found as far North as the fifty-seventh degree.



THE COMMON SKUNK.

Its body is about seventeen inches long; its tail, with its long hair, fourteen. Its head is small compared with the body, which is broad and fleshy, and so much wider at the hips than the shoulders that the animal has a wedge-shaped appearance; forehead, somewhat rounded; nose, obtuse; eyes, small; ears, short, broad and rounded; legs, short; feet, rather broad, covered with hair, concealing the nails which, in the fore feet, are stout, curved and acute; palms, naked; the glands containing the fetid liquid that renders the skunk of such bad repute, are situated either side the rectum, and will contain about three drams; their pyriform ducts are about an inch long. The fur of the skunk is long and coarse, with much longer, smooth and glossy hairs, interspersed; the hair on the tail is long and bushy, with none of the fine hair, except near the root.

The color varies very greatly in individuals, so it is impossible to find two marked alike. Usually, there is a white stripe in the face, which, extending back between the ears, divides on the shoulders and runs towards the hips in the form of the letter "V." As these stripes vary from narrow to wide, so the skins are termed "black," "striped" and "white;" the tail is black, usually tipped with white. The under fur on all portions of the body which are dark colored, is dark brown; on other parts, white.

The skunk is not confined to thinly-settled parts of the country, but frequently takes up its abode near houses and under out-buildings and hay stacks; more frequently, it lives in burrows which its fore-paws are well fitted to dig out; these burrows, after extending seven or eight feet in a straight line, end in a large nest of leaves. Here, in winter, five to fifteen individuals may be found, lying half asleep. Though rarely seen out of its burrow during December and January, it lays up no Winter stores.

It is not strictly nocturnal, though usually, during the day, it remains concealed in its burrow, or in stone walls or some other place of shelter, and prowls at night for its food. Being very slow in its movements, it is strange it should always find enough, as its good condition indicates. It feeds on eggs, young birds, domestic fowls, mice, frogs and lizards, and during Summer, insects form no inconsiderable part of its food.

AUDUBON says, on dissecting a specimen found in Carolina, he discovered the animal had devoured, the previous night, a dozen very rare beetles, a greater number than he had been able to find in a search of ten years. Its young are produced in early Spring, from five to nine in a litter.

No animal is more easily caught in traps. It readily enters the dead-fall, box trap, or steel traps, to obtain a bait of any kind of fresh meat. It is easily caught by setting a steel trap (unbaited) at the mouth of its burrow, covering it lightly with leaves or dirt. It is very frequently found in all traps set for other land animals. When caught in a trap that does not kill it, the skunk makes the best of his situation, and devours the bait which tempted him to his doom. When caught in a steel trap, detach the trap carefully from its fastenings, carry the skunk in it, on the end of a long pole, to the nearest water and drown it. If this is done carefully, it will not employ its natural means of defense. If necessary, let the animal remain under water two or three days, when it will be so far deodorized it may be skinned without inconvenience.

When irritated or attacked it elevates its tail over its back, and, by a strong, muscular exertion, ejects in two thread-like streams, with unerring aim towards its enemy, to the distance of fourteen feet, the most nauseating and stifling scent that exists in nature. If suspended by its tail it cannot eject this fluid.

I once saw one removed from a cellar, being lifted by the tail with a pair of tongs; and thus held, it was shot without trouble. It is a cleanly animal, and its presence, during cold weather, is not indicated by any bad odor, so that whole families often live under a barn without their presence being suspected.

This fluid is very acrid, and it is commonly believed, if a drop of it is thrown into the eye it will cause blindness; dogs often suffer very much from it in their encounters with the skunk. It is a specific for asthma, but it renders the patient so loathsome to himself and others that the remedy is considered worse than the disease. It will taint the air to some distance; and if milk, butter, and many other kinds of food are within its influence, they quickly become unfit for use. Repeated washings, exposure to the atmosphere for some time, or a long burial in the ground, will weaken the scent in clothes, but the most effectual disinfectant is chloride of lime.

The flesh is white and savory; but a natural prejudice will probably hinder its becoming a popular article of food. Skunk's oil is softening and penetrating and is reckoned good for stiff joints, and it is often used in cases of croup. We are unable to tell to what uses the skins are put; but during the last fifteen years they have become quite an article of commerce, and they are probably made up and sold under some other name. Their value depends upon their color; the "black" brings about $1.50; the "striped," 75c.; the "white," 40c. This increase of value has made a very perceptible decrease of numbers throughout the country. R.

Arboricultural.

ORANGE AND LEMON TREES.

AFTER some little trouble, I have succeeded in raising a lemon tree, and would like your advice on the treatment and temperature it needs in Winter. Please state, also, if the orange plant varies in treatment.—M. W. H., *New York City.*

ORANGE and lemon trees require similar treatment, and in this climate must be kept in a warm room or greenroom during Winter. If placed in a cellar, they will lose their leaves and become unhealthy, although many are kept over Winter in this way; but we have never known one to come out in Spring as healthy as it was when put in the Fall previous. Light and warmth are required, and frequent syringing of the leaves to keep the pores from being filled with dust. This syringing or washing of the leaves of all such plants as camellias, oranges, lemons and gardenias, is a far more important operation than many amateurs suppose it to be; and many a choice broad-leaved evergreen, as well as children, die for the want of a clean face. The soil for such plants should be a compact, rich loam, not too light or too heavy, but of a nature that will pack firmly, but not crack, and become brick-like when dry. Keep the plants well watered when growing rapidly; but when at rest, give just enough water to prevent the dropping of the leaves and shriveling of the bark. If the orange leaf or bark scale appear, syringe the plants thoroughly with soap suds heated to 150°. This minute insect, which is covered with a tortoise-like scale, is a great pest to orange, lemon and oleander trees; but strong soap suds, of the temperature we have named, will usually destroy it.

The Poultry Yard.

ENGLISH INCUBATORS.

Mr. Wm. H. Thick, London, Eng., has invented an incubator, which we find illustrated in the Farmer, which we have had engraved, and give herewith Mr. Thick's description thereof, since it will interest many of our chicken fanciers. He says:—These incubators are constructed with a reservoir holding about 10 gallons of water. Heat is supplied by gas or by a paraffine oil lamp—the temperature required for hatching being regularly maintained day and night. Air-carrying pipes pass through the heated water, and carry warmed air to all parts of the hatching apparatus, and hot-water boxes form a part of the reservoir under which the chicks when hatched are placed to receive the heat necessary for their health. The boxes are covered with a lamb-skin or a "Wool-Mother," against which the chickens nestle their backs, while the cool gravelled flooring affords for their feet a surface similar to that which they would have, had they been naturally hatched. It is calculated that if proper attention be paid to the instructions, 70 per cent. at least of strong healthy birds may be hatched out.

The drawers of the incubators should be strewn with bran or hay cut into small pieces, but never with sawdust, as the turpentine in the wood tends to destroy the germ in the egg.

We spread a quantity of hay upon the bottom of the drawers, so as to line them completely; and we place fifty hens' eggs in each drawer on the hay, and close the drawers. Heat is communicated from the water in the reservoir, the temperature of which must be about 120°. Fahr., in order to have the eggs at the required temperature of 102°. to 104.

Twice every day the drawer is opened to turn the eggs, and they are then left exposed to the cooler air of the apartment for a quarter of an hour before being replaced in the machine. When we add that the position of the eggs in the drawer may also be changed three or four times a day, we have given all necessary directions. After an incubation of twenty-one days, the chickens will break their way out of their shells. They are then left for four-and-twenty hours after they are hatched under the "Wool-Mothers," to dry and gain strength. During this time they are better without food, as the nourishment they have taken before breaking the shell is sufficient to serve them for that period.

The system of chicken-rearing we have described is admirable for the careful observation of natural processes upon which it is based. Nature has been copied with the most perfect tact, and it is owing to the faithful imitation of her operations and conditions that success has been attained. The reservoir with its flannel covering represents the sitting hen, and the heat that proceeds from the reservoir is of the same nature as the moist heat which emanates from the body of the parent bird.

The hen on her nest warms her eggs from above, and the incubator is so constructed as to supply the heat from the same direction. The hen turns her eggs once or twice a day, removing those that are in the center of the nest to the outside, and those that are on the outside into the center, so that an equable heat is diffused throughout. This operation on the part of the parent bird may easily be traced by marking the eggs with pencil, and arranging them in a certain order before the sitting commences. In using the incubator, the same process of shifting and turning is strictly observed. The hen quits her eggs once or twice a day, for a few minutes—about a quarter of an hour—in order to take the nourishment necessary to sustain life, and thus the eggs are allowed to cool to some extent during the interval, the variation of temperature being considered favorable to the process of incubation. In using the incubator we take out the drawer and expose the eggs to the air of the room, thus imitating the natural process in every minute particular.

Timid hens are bad sitters, and if from any sudden alarm a shock is given to the eggs, the hope of chickens may be considered as gone for ever; but in the case of the incubator, with its softly-lined drawers, the eggs are not injured, though the apparatus is kept in a workshop in which the din of the hammer is continually heard.

With regard to the economical advantage of using the most improved hatching apparatus, we have to inquire what is the cost of the grain consumed by a hen hatching fifteen or sixteen eggs only, compared with the cost of the oil or gas required to maintain the temperature in an incubator hatching 100 or 200 eggs. Experiment proves that the artificial heater costs about two-pence every twenty-four hours, so that the expense of hatching the brood of from one to two hundred is under 4s. In Summer, when the temperature of the atmosphere is naturally high, the expense is considerably less. On the other hand, the brood hen is not fed at a less expense than one penny *per diem*, and at this rate no more than 30

UNION TELEGRAPH COLLEGE AT OBERLIN, OHIO.—(See page 286.)

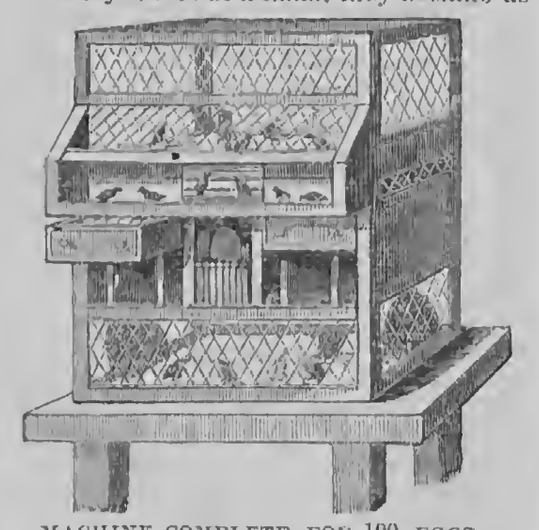
eggs are hatched naturally, at the outlay which, by using the incubator, will ensure the hatching of two hundred. Besides this evident advantage, it is to be remembered that in artificial hatching the mother bird is free to continue laying uninterruptedly—thus paying its own way.

When the chickens are hatched, dried, and covered with down, at which condition they will arrive about two-and-twenty days after incubation, they are placed under the "Artificial Mother." The water boxes being properly heated, are covered with lamb-skin, under which the chickens shelter and warm themselves. In this *nursery* they are kept and fed for about a week; they are then let out, but still kept near the nursery, the runs of which remain open so that they may enter when alarmed or when called to feed.

Hygienic Information.

HYGIENIC NOTES AND QUERIES.

Celery as a Nervine.—A correspondent of the Practical Farmer says: "I have known many men, and women too, who, from various causes, had become so much affected with nervousness that when they stretched out their hands they shook like aspen leaves on windy days; and by a daily moderate use of the blanched foot stalks of the celery leaves as a salad, they became as



MACHINE COMPLETE FOR 100 EGGS.

strong and steady in the limbs as other people. I have known others so very nervous that the least annoyance put them in a state of agitation, who were in almost constant perplexity and fear, and who were effectually cured by a daily moderate use of blanched celery as a salad at meal times. I have known others cured by using celery for palpitation of the heart.

To Expel Proud Flesh.—Proud flesh may be cured, as I know by experience, by simply wrapping the part affected in dry wheat flour, changing it as often as is necessary. I have seen very bad cases cured by this simple remedy.—R. V. D.

Sugar for Scrofulous Children.—A physician once said that children of scrofulous and a weak habit should be allowed all the white sugar they desire, since it improves digestion and strengthens the blood.

Entomological.

THE TREE CRICKET.

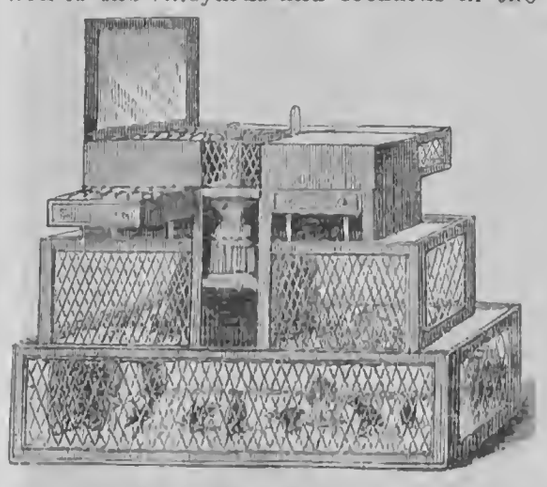
Please find inclosed two insects that I found on my young apple and elm trees. I send some of the wood attacked—mostly of this year's growth.—A Subscriber, *Chemung Co., N. Y.*

The insect is the Tree Cricket (*Œcanthus niveus*, Harris). The branches you send contain the eggs deposited by the female, and are placed in long, contiguous rows, the punctures are close together, and about as large as would be made by an ordinary pin thrust half way through the twig. Of course, a small twig punctured in this manner is very likely to die, and it is quite often the case that orchards supposed to be affected with what is known as twig blight are not so in fact; but the young terminal shoots have been killed by being punctured by this tree cricket. These facts only show how unreasonable a man must be to suppose, or even ask us to tell him, what makes the branches or young twigs of his apple trees die without giving us the least clue to the cause. We have frequently had such questions asked us, the questioner not even sending us a twig for examination.

This cricket also deposits its eggs in the twigs of various other species of trees, and we have received grape cuttings this season containing the eggs of this or a closely allied species. It also has a habit of cutting off the bunches of grapes, letting them drop to the ground, but for what purpose we are at a loss to determine.

From Texas we have received another species which attacks the grape vines in Spring and Summer, cutting off and eating the leaves. Mr. Horson, of Sherman, Texas, informs us that this cricket is so abundant in his neighborhood that young vines for the past two years have been seriously injured by their depredations.

The crickets working at night, it becomes quite a difficult matter to find and kill them. We would advise a close examination of the vineyards and orchards in the



MACHINE COMPLETE FOR 200 EGGS.

Autumn, and every punctured twig cut off and burned. We do not know of any better way of getting rid of these pests.

Another of the Same Insects.—Inclosed is an insect I found on my clothes while walking in the woods. What is it?—Reader.

It is the same cricket described above, therefore you can be on the look-out for the eggs in your garden and orchard.

CABBAGE WORMS.

The battle with the cabbage worms for this season is past, and they are, as they have been for two years previous, victorious, or successful in utterly ruining the cabbage crop; and all we can do now is to arm ourselves for the next campaign. In speaking of the cabbage worm last August in the Rural New-Yorker, you frankly admit that you do not know of an effectual remedy for them; and after a thorough trial of all the numerous popular remedies during the last two seasons, I confidently assert that *there is no reliable remedy after the eggs have been deposited upon the cabbages;* and that all remedies aimed solely *at the worms* are failures. To give a history of my experience with these larvæ would require a volume. So I will, in as few words as practicable, state the *result* of that experience for the benefit of those who intend or desire to raise cabbages next year.

The reason why I consider all "worm remedies" useless and vain, is the fact that the parent butterfly (*Pieris rapæ*) continues to lay her eggs upon the cabbages from June till Oct., and the eggs continue to hatch as long as the weather is warm enough to develop them; consequently, I found that, although I might kill every worm visible on the cabbages, with water at 130°, in two days thereafter another voracious brood would succeed the slain; and it is thus with all worm remedies. One must "fight it out on that line," and "it takes all Summer," and in the end the cabbages are spoiled, or so badly worm-eaten and filled with their excrements as to be unfit for use.

After becoming convinced that *it is vain to fight the worms*—that the only hope for the successful cultivation of the cabbage lies in finding a means of preventing the butterfly from depositing her eggs upon the plants, I commenced a series of experiments with various pungent and repulsive odors, as musk, camphor, spirits of turpentine, petroleum, asafœtida, etc., in order to keep the butterfly off the cabbages. But these odors had no perceptible effect in deterring them from this work. At length, by carefully studying the habits and movements of these insects on the wing, and especially when alighting, I was led to suspect that a *net* spread over the cabbages would prevent them from lighting upon the plants, and, of course, from laying their eggs on the leaves.

On making a trial with a *white* net (the meshes about two-thirds of an inch in diameter) I was not disappointed, and was very happy to see the butterflies in great numbers lighting upon, but *never passing through the net.* I do not, therefore, hesitate to recommend a coarse white net spread over cabbages (about a foot above them, and coming down to the ground on all sides,) as the only infallible remedy for, and preventive against, cabbage worms. The same net would probably last several years. It is not necessary now to suggest a convenient method of spreading or fastening the nets so as to be easily removed for hoeing the cabbages. But I may do so next year if desired. It was too late in the season when I made the above simple *discovery* to make it available in saving any cabbages this year, which is my apology for not giving it to the public through the Rural New-Yorker before. I. W. Taylor.

ENTOMOLOGICAL NOTES.

Parasitic Flies in a Caterpillar.—Inclosed you will find specimens of insects. No. 1 is a caterpillar and eggs (or shells) which were deposited on the 6th, 7th and 8th of Sept.; and on the 13th there appeared, as the product of the eggs, the insects inclosed in the quill. Are these insects the natural offspring of the caterpillar?—Reader.

The small flies inclosed in the quill are not the natural offspring of the caterpillar, but parasites which fed upon and passed through their transformations within its body. There are hundreds of different species of these parasitic flies which attack worms, caterpillars, and the pupæ of various large insects, and they are generally considered beneficial and should not be destroyed. A very minute species resembling the one you send, attacks the chrysalids of the green cabbage worm (*Pieris rapæ*) which is now so abundant in the Eastern States. As many as twenty of these little flies, known among entomologists as *Pteromalus puparum*, have been hatched from one chrysalis. The infested caterpillars, or chrysalids, are readily transported from one portion of the country to another, and thus the enemies of our noxious insects can be distributed in regions where their services are most needed. But to do this we must know something of insect life, which we regret to say is a subject almost wholly ignored by our common schools as well as colleges.

Industrial Topics.

SOME THINGS IN TENNESSEE.

I HAVE been for several days looking at the country about Nashville, which has been famous for its agriculture and stock raising for many years; as this was the pioneer settlement of the State, and the lands in the valley of the Cumberland were very inviting.

Among the earliest settlers were Mr. HARDING, father of the present Gen. W. C. HARDING, long famous as a breeder of blood horses, and MARK R. COCKRILL, father of the present brothers, BENJAMIN, MARK and JAMES. The original domain of the HARDINGS was a tract of 1,400 acres, to which the present proprietor has added, from time to time, until the estate covers 3,780 acres. Nearly all of it is of a very fertile soil and bounded by a rim of wooded hills which stand like sentinels about its borders and make—as Gen. HARDING says—very quiet neighbors, as he likes elbow room and does not believe in the policy of dense population. This domain is inclosed by a substantial stone wall, and several of the sub-divisions are of the same material. The whole is traversed by streams of living water; much of it is in open woods pasture, and there is a deer park of 450 acres, in which are 100 head of deer, nearly as wild as if in their native state.

By the courtesy of Gen. JACKSON, son-in-law of Gen. HARDING, whose guest I was for a night and morning, I was enabled to look this estate all over on horseback, in company with the former, who has abandoned the sword, which was the profession of his lifetime before and during the late unpleasantness, for the plantation saddle and the domestic home.

Gen. HARDING'S system of cultivation has been quite thorough, both as to his grains and grasses, and his land, after all these years of cropping, is in good tilth. The timber has not been sacrificed, as the provident proprietor is always mindful of the rights of posterity.

I had been for over twenty years familiar with the name and fame of MARK R. COCKRILL as a breeder of fine-wooled sheep, and it was with no small satisfaction that I fell in with an invitation from BENJ. F. COCKRILL, his son, to make a night at the old homestead. The veteran and pioneer wool grower of Tennessee departed this life a year ago, but he has left in his three sons an assurance that the work of his lifetime will not fall backward. It was a treat to pasture my eyes upon a tribe of such sheep, bred with so much of skill and care for so many years.

Before the war the sheep flocks of Mr. COCKRILL numbered 7,000 head, but the soldiers of both armies foraged upon them until a large number were killed, and the present flock consists of 850 head. The flock was made up of a Saxony base, which was repeatedly reinforced by importations of Siberian, German and Spanish Merinos, always breeding for form, size and fleece, until the present quality of the flock would almost tempt even CARL HEYNE, the old shepherd of Mr. CHAMBERLAIN, to desert the Hudson and join the COCKRILLS in Tennessee. Besides the best of sheep the COCKRILLS have some of the best blood horses I ever laid my hands or my eyes upon, combining fineness with great substance and durability. They have also very fine Short-Horn cattle of the best blood.

The landed estate of the late MARK R. COCKRILL lies in a great bend of the Cumberland River, and consists of 5,500 acres of very fertile land. This estate, like that of Gen. HARDING'S, lies some six miles from Nashville.

Of the Tennessee State Fair, which is now in progress at Nashville, I have only space to say it is fairly made up of very handsome horses, pretty good Short-Horn cattle, a handsome show of vegetables, grains, plants, household manufactures, etc. The attendance reaches four or five thousand when the horses are to perform on the track.—S. D. H.

From Tennessee to Alabama.

IN the country immediately south of Nashville, commences the cotton-growing region of Tennessee, which, years ago, was a more productive crop than it is now, on the old lands in that latitude; still a great many planters stick to it like second nature, when, if they would put their farms in order for stock growing, they would improve their condition—that is to say, both the condition of the farms and the people. Dr. M. W. PHILLIPS said to me, that Southern men must have the tops of their heads taken off and cleaned out of their cotton ideas before Southern agriculture would advance in a healthy way. The pungent Doctor is partly right, and entirely so as relates to Middle Tennessee; but in the more productive lands of Georgia, Alabama, and Arkansas, cotton is the most remunerative plantation crop that can be grown, always premising that the planter has sufficient gumption and capital to carry on his business to advantage. But the people of the South are poor, and what with their old time pride and their present poverty, they are staggering under a burden too heavy to be borne, and cursing the stars which rule their hard destiny.

From Nashville to Montgomery I traveled over a new route just opened through the heart of Alabama, by a railway from Decatur, the whole line operated by the Louisville and Nashville Railroad Company. This great Southern route passes through the rich mineral region of the mountain district of Alabama, and is also the most direct route to the Gulf, through the center of the cotton region. The road is built for a heavy business, and it will have such a business. The coal and iron are being largely worked, and the long-time silent and solitary mountains of Alabama are becoming the abode of busy workmen in the mining of coal and the production of iron.

This is the season of cotton picking, and I see large fields of snowy whiteness from which the staple is rapidly going into bales. But the yield has been very much diminished by the ravages of the boll worm which followed the rain storms and floods of July. As there is nothing else to fall back upon when the cotton fails, in this region, the whole population suffers deeply from this cause; but the people are slow to learn that their only independence from this state of affairs lies in a more diversified system of agricultural production.

The city of Montgomery, from which I now write, is the most uniformly well-built and tasteful of any city I have seen in all the South. It is situated upon a beautiful elevation, which commands a view of the surrounding country within a radius of forty miles. S. D. H.

Oct. 12, 1872.

UNION TELEGRAPH COLLEGE.

OBERLIN, O., has long been famous for its literary college, where the experiment of co-education of the sexes has been successfully demonstrated. That city now has another college, called the Union College, where young men and women are taught practical telegraphy in all its branches. Our illustration (see page 285) shows the interior of the new operating room for students, sixty feet in length by twenty-four in width, handsomely fitted up and recently opened on West College street. The students in attendance number from sixty to one hundred and sixty. When graduated they are guaranteed positions. The students can enter at any time, and a life scholarship may be had for $35. Board is very cheap in Oberlin, being only $2.50 to $3.25 per week. The telegraph business is developing with such wonderful rapidity, operators are in constant demand, and we know of no better or cheaper place for both sexes to learn the art than in Oberlin. A line of telegraph, seventy miles in length, with stations, is under the control of the College for the benefit of the students. Over this line they are taught to transact all branches of the business.

Our Western Associate Editor, Col. S. D. HARRIS, has had two children, a son and daughter, educated at this college; both are now filling good positions. Writing to the RURAL, he says:

"As the whole family connection are in telegraphic and railroad business, we are fully competent to tell what we know about such things in general, and as we have visited the Union Telegraph College, at Oberlin, we can say, from personal observation, that a most thorough training is given to the students of that institution. WM. C. A. SHEARMAN is the President, and A. G. D. SHEARMAN is the Principal, assisted by competent professors and teachers. The College is supported entirely by telegraph men, and as such is practical and responsible."

MAKE A NOTE OF IT.

KEEPING a diary is troublesome business, but keeping a small blank book always in your side pocket, with a pencil in it, is easy enough. In this book a man should set down every important item of business which is necessary to be looked after. For example, such needed repairs about the farm, garden, orchard, dwelling, barn, and other out-door affairs. Again, those who write for Rural papers, often have ideas and subjects which present themselves to the mind, and which they would like to put in due form for publication at some other time. A good plan is to make a note of this in a memorandum book, whenever and wherever the thought may suggest itself; and then, at your leisure, you can give that thought ample expression in words, and thereby benefit others by giving them the results of your experience. Besides these things, such a book is useful as a repository for messages given one by others, or as a safe place to put down thoughts as they occur, of such matters of business or pleasure as one may desire, at some other time and place, to look into. I have carried such a book for years, and find it a great help to my memory—so much so, indeed, that I would not willingly lay it aside. Try it awhile, and judge for yourself.

WOODMAN.

Farm Economy.

MEASURING CORN IN THE CRIB.

GEO. A. BUCKLIN asks us to give a correct rule for the measurement of corn (in the ear) in a crib. GEO. E. WARING, in his Farmers' and Mechanics' Manual, gives the following rules:

When the crib is equilateral, multiply the length in inches by the breadth in inches, and that again by the hight in inches, and divide the product by 2,748 (the number of cubic inches in a heaped bushel), and the quotient will be the number of heaped bushels of ears. Take two-thirds of the quotient for the number of bushels of shelled corn. This rule assumes that three heaping half-bushels of ears make one struck bushel of shelled corn; but some claim that two heaping bushels of ears to one of shelled corn is more correct. This depends upon the kind of corn, shape of the ear, etc.

When the crib is flared at the sides, the following rule is given:—Multiply half the sum of the top and bottom widths in inches by the perpendicular hight in inches, and that again by the length in inches, and divide the product by 2,748, and the quotient will be the number of heaped bushels of ears. Take two-thirds of the quotient for the number of bushels of shelled corn, as before.

Another rule, which farmers in some localities have adopted, is:—Multiply the length, breadth and hight of a crib, in feet, together; multiply this product by four; strike off the right figure, and the result will be shelled bushels.

We may say, with reference to these three rules, that they are and can be only approximate; for corn so varies in character (size of cob, etc.) that the result of measurement in the ear must vary.

ECONOMICAL NOTES.

Measuring Grain in the Bin.—A correspondent of the Rural Californian gives the following rule for measuring grain in the bin:—First get the actual number of *cubic feet*, which is done by multiplying the interior length, breadth and depth together, then eight-tenths of the cubic feet will be the number of bushels that the bin will contain, or eight-tenths of the cubic feet of grain will be the number of bushels. To get eight-tenths, multiply the cubic feet by eight, place a period before the first right hand figure, and you have the bushels and tenths of bushels. If you measure corn on the cob, allow one-half for the cob, so that four-tenths of the cubic feet will be the number of bushels of shelled corn. Illustrate: — Bin 10x10x10 feet, multiply these together, product one thousand; of which sum eight-tenths or 0.8 will be bushels, and four-tenths or 0.4 if corn in the ear; that is, 800 or 400 bushels, as the corn may be shelled or on the cob.

Long Furrows in Plowing.—A German agricultural journal prints a plea for long furrows. The turning of the plow and the commencing of a new furrow require more exertion in the plowman and the team than continued work on a straight line; and how great may really be the loss of time from frequent interruptions in short turns may be shown by the following calculations:—In a field 225 feet long, five and a-half hours out of ten are used in re-directing the plow; with a length of 575 feet, four hours are sufficient for the purpose; and when the plow can proceed without interruption for 800 feet, only one and a-half hours of the daily working time are consumed.

Scientific and Useful.

TO PREVENT CRICKETS DESTROYING CLOTHES.

A CORRESPONDENT of the RURAL NEW-YORKER asks for a remedy to prevent crickets from destroying clothes. For want of a better I will give him one which was successful a long time since. A Mr. R——, moving into the village of Penn Yan, this State, found it necessary to occupy for a short time an old mansion where successive generations of crickets had lived and flourished and sang time out of mind. The first night of the arrival of the family the hired man and boy deposited their stockings on the hearth as they retired to rest. The next morning revealed sundry depredations which were at once charged to the crickets. The hired man vowed revenge. Accordingly the next night, after the family had retired, he laid a train of crumbs of bread around the whole circle of the old fireplace, and then followed it by a train of gunpowder in close proximity to the bread. The crickets were not long in discovering the feast which was so suddenly spread for their benefit, and gathered in large numbers on the occasion, doubtless chirping over the agreeable change in their diet from dirty stockings the night before. But a change came over the spirit of their dreams. In the silence of the night, while in the hight of their revelry, the match was applied. The explosion that followed was unprecedented in the annals of cricketdom. Heads, legs and wings were scattered in every direction. It was a regular Waterloo victory. A few old ones, who were slow to the feast, escaped, and, the story goes, for a few following evenings chanted a requiem to their slaughtered friends, and then abandoning the old chimney, left the boys in peaceful possession of the ground forever. R.

Lairdsville, Oneida Co., N. Y.

STONE-COLORED WASH.

IN reply to your correspondent, "A. B., Reading, Pa.," asking for a recipe for a durable stone-colored wash suitable for fences, I can give him one apparently as durable as stone, or, at least, more durable than oil paint I used at the same time on another building. I painted a board fence and a rough out-building two years ago, and it is nearly as good to-day as it was when finished, and it costs comparatively nothing. The fence is a common, rough board fence, with a cap-board nailed on the top; and I have leaned on the fence a hundred times, and it will not soil a black coat, or any garment, by so doing, but appears slaty, with no disposition to crumble.

Take two pounds of flaxseed, and boil it in a common wash boiler for an hour or more, in four pails of water; after thoroughly boiling, strain it into any old tight barrel; put in one peck, in bulk, of common land plaster, one peck of nicely sifted wood ashes, one quart of wheat flour, and one quart of salt. Put in your barrel a good stick as large as a hand spike, and stir it till it is as thick as cream; let it stand in the sun for a week, and every time you go by the barrel stir it thoroughly, and by the end of the week it won't settle, but will remain incorporated, and is fit for use.

The above was made in quite warm weather, and worked up like sponge batter, two or three times, before I put it on; but a good stirring would, in a minute or two, reduce it again to its creamy consistency. It is now as hard as slate, and is certainly valuable in preserving the wood, and is a cheap luxury in good looks for fences or second-class buildings, and I know it is no humbug. HATTON.

Howell, Mich.

SCIENTIFIC AND USEFUL NOTES.

How to Clarify Honey.—The Druggists' Circular gives the following mode:—A good way to clarify honey is to add to two pounds of a mixture of equal parts of honey and water, one dram of carbonate of magnesia. After shaking occasionally during a couple of hours, the residue is allowed to settle, and the whole filtered, when a beautiful clear filtrate is obtained, which may be evaporated in a water bath to the proper consistency. The only draw-back to this method is the length of time it takes to filter the solution; and this may be much abbreviated by taking the same amount of white clay instead of magnesia, when a nearly equally good article is obtained in much less time.

Modes and Manners.

RULES FOR DRESSING.

If WOMEN would only believe it, it is much more economical to be well dressed. The saving in money is readily accomplished by a little expenditure of thought; that is, thought properly directed, for no one would be rash enough to assert women do not think enough about their clothes. The trouble is they think in detail, while the question of dress is one of wholes. It is not enough that a woman wears a pretty tie, an elegant collar or a handsome dress. To be well dressed is to make an agreeable appearance, and that is not to be referred to any single article as a redeeming feature, but to the harmony which prevails through every feature of a woman's toilet.

Moreover, to be well dressed is not a question of costly material, but of colors and outlines. It is within the scope of her whose dress is but a shilling calico, as well as of the lady who knows no limit to her income. At the bottom there are a few simple rules universal in their application, and which no woman can afford to ignore. The first is,

Never wear shams. Brass jewelry, mock coral, false stones, cotton velvet and laces, are the sworn enemies of all good dressing. Also, they are expensive, for they will not wear, and require constant replenishing. Jewelry is not indispensable, and unless it is handsome in itself and exactly suited to the wearer's complexion and features it does not compare in effect with a becoming bow. Velvet, every body knows, is the especial property of the rich; because it is beautiful only when of good quality, and when of good quality it is very expensive. Otherwise it is common, cheap and ugly. Between cotton laces and a narrow strip of fresh, white linen one can scarcely realize that any one could hesitate. The one is so fresh, pure and eminently lady-like; the other so tawdry, coarse and hard against the skin. Pure, genuine laces, with their soft-color and fleecy mesh, take precedence of everything else in relieving the complexion. One can readily pardon the enthusiasm which collects beautiful specimens; for though costly they are durable, and in the end really economical. A good piece of Valenciennes, with proper care and washing, will last several seasons, which cannot be said for that which is not genuine.

Shams are to be avoided, on aesthetic and economical grounds; but there are also moral reasons for shunning them. They are untruths; they pretend to be what they are not. They subtly accustom one to deception, which in time may become a habit. They lower the tone of a woman's nature and even prompt her to downright falsehood. If she buys a bracelet of fire-gilt for $5, she is very apt, when pressed to the wall, to declare she paid $50 at some celebrated jeweler's. Therefore, to preserve your own self-respect, never wear shams.

Never wear but two colors, and let those be harmonious. This leaves out of consideration black and white, which can enter into any combinations. The French women, we all agree, understand the art of dress better than all others. No matter what the fashion is, we accept it if it bears the stamp of their approval; and through our faith we wear whatever the fashionable dressmakers choose to impose on us. We would do better if we would follow the Frenchwoman's independent example, who wears nothing that is not becoming to her individually. She understands herself well enough to know what colors and what combinations of colors belong to her. This she has decided for herself. If she is dark and sallow, she would throw herself in the Seine before wearing purple on pea-green. If she is a light blonde, with abundance of rosy color, she does not select a ribbon of red to tie up her hair. There is not a grisette on the streets of Paris that would wear a color false to her style and complexion. First, then, know what colors you can wear and do not buy those you cannot. With reference, then, to the hue of your dress, select the colors for trimming, ties and ribbons, which are in harmony also with your complexion.

The most elegant and expensive dress cannot stand ill-chosen minor adornments. Think, then, what colors you can wear if you are a brunette, and do not adopt those of MARIA JONES because she is your bosom friend when she happens to be a blonde. By having something to start upon, your practised eyes can soon discover hundreds of modifications with which to vary your toilet. Few colors, and those becoming, render your wardrobe much less expensive, for they can be used with one another, and you will not feel the necessity of buying articles of a variety of colors, nor tempted by things that are in themselves pretty, though unsuitable to you.

Recognize the beauty of outlines, and the graceful flow of drapery. That is, have your costumes made becomingly. If you are tall, let that be taken into consideration; if small, if lean, if fat, if straight, if crooked—adapt your dress to your form. If your chest is narrow and sunken, dispose your trimmings to relieve it. If you are large and fully developed, carry out the outline, but do not increase it by bristling puffs and ruffles. Infuse your own individuality in your costume; if you are jaunty and piquant, don't gird yourself in a stiff polonaise; if you are of Juno-like proportions, don't wear a sailor hat nor a cutaway sack. In the words of the Psalmist, "Know thyself," thy income, thy position, thy style, thy form, and dress accordingly. Having finally secured at most two becoming toilets, you will be satisfied to wear them until they can be worn no longer, nor be sighing, meanwhile, for more.

Answers to Inquiries.—ROSE GERANIUM.—Basques will be worn more this year than last; they are more becoming to slender figures than the polonaise. Trim your dress with bias ruffles of the same. On the bottom of the lower skirt put a little ruffle a finger's length in depth, above this, in large box plaits, a ruffle ten inches in depth; as a heading another small ruffle gathered near the edge; trim the overskirt with a similar ruffle. On the waist arrange several small standing ruffles in the manner most becoming to your figure.

ARBITRATION AMONG FARMERS.

"DON'T go to law, dear sir—not if you can possibly avoid it—in a question of dispute or disagreement merely," said we to a farmer who complained grievously of the operations of one of his neighbors. It then occurred to us how much time, temper and cash might be saved if each farm neighborhood had its Board of Arbitrators; or if farmers, when they "get their backs up," would agree to submit the question at issue to arbitration. Of course it is often necessary to prosecute men to recover the amount of a debt. There are cases where the legal is the most direct mode of reaching a decision and conclusive result. But in questions of boundary, damages, disputes about claims, division of stock, etc., etc., where many men go to law and both parties get outrageously plucked by their respective lawyers, and damage the whole neighborhood by stirring up strife, creating factions, and robbing the witnesses in the case of valuable time, let arbitration be resorted to. Let the law of equity and not the law of technicalities and quibbles rule. Let justice be done by the peers of these disputants—these arbitrators being chosen, directly or indirectly, by themselves.

We firmly believe if this course were more generally pursued it would not only diminish the amount of litigation among agriculturists one-half (or more) and the tax for such litigation proportionately, but tend to lessen the number of disputes and misunderstandings among men; for it would make them more careful not to provoke the scrutiny of their acts which arbitration involves, and which must be judged of in their nakedness, stripped of all legal tergiversation. There would be less reliance upon the skill of a lawyer to tangle up a jury in a web of legal phrases and consequent doubts, and a far clearer view and appreciation of justice and equity in neighborhood intercourse would obtain. Arbitrators would be brought face to face with facts; and these facts would undergo the investigation of men accustomed to judge in matters of an agricultural character, and familiar with the customs and necessities of agriculturists.

DEVELOPMENT OF HOME CONSUMPTION.

THE importance of the development of home manufactures with a view to the consumption at home of farm products is nowhere more strikingly illustrated than just now at the West and testified to, indirectly, by the ablest Free Trade organ there—the Chicago Tribune. For instance, it complains of the great advance in freights, and states that the cost of moving corn from a point 100 miles distant from Chicago by way of the lakes and Erie canal to New York, with intermediate charges, is 41½ cents per bushel. Corn, at the date of our last issue, was worth, maximum, 61 cents. Allow three cents per bushel to cover profits and expenses in New York, there is left to the producer 20½ cents per bushel to cover the cost of production, interest on the land and pay him his profits. In the case of oats it is still worse, but 6 to 10 cents being left for the producer. The Tribune says:

The present freight charges to New York are nearly double the average rates of last year, and the advance in freights is of necessity taken from the price of the grain in the hands of the producer. The rise in domestic freights is in sympathy with the advance in ocean freights, but the oppression upon the producer is none the less severe. It consumes their product. It is no longer a case of sending one bushel to pay the freight of another; that operation no longer pays. The producer, if freights go any higher, or the price of grain should fall in Liverpool, will have to send some money along in addition to the corn, to pay the freight on the latter.

Yet this paper advocates a system which must result in placing the producer in the power of transportation lines whose stock is largely held abroad, and compelling him to compete in a foreign market with the products of other countries. The truth is, every cent taken from the tariff on manufactures which we can make in this country from material which our farms and mines will supply, adds twice the power to foreign countries to control the price of our products and oppress American producers. Does it not make a difference to a farmer whether he can get a good price for his products within five miles of his farm instead of within fifty? Is it not so much added to his profit if he can haul two loads of grain to market per day instead of one? And yet whatever prevents the development of American manufactures places the American farmer's market farther from him, and increases his dependence upon combinations and monopolies.

RURAL NOTES AND QUERIES

"Rural" Progress.—Thanks, Good Friends!—For the frequent and generous responses we are daily receiving from Club Agents, and other good Friends, all over the country, we tender sincere thanks. Our former assertion, that the RURAL NEW-YORKER has the best and most Influential Corps of Agent-Friends of any journal in the land, is being verified now-a-days, for, even before Election, we are not only receiving hosts of Trial Subscriptions, but many for Fifteen Months (from Oct. 1, '72,) and next year. We send a copy of the charming Steel Engraving (BIRTH-DAY MORNING, or The Gardener's Present.) promptly to every person who remits either $5 for ten Trial Subscribers, (from Oct. to Jan.,) $3 for fifteen months, (from Oct. 1,) or $2 50 for one year. And the picture pleases everybody, so far—not a dissenting voice having been heard or letter received. Remember that no one has to wait for the Engraving—for by working day and night our steel-plate printers are keeping us well supplied, so that *we are enabled to fill all orders on the day of their reception.*

☞ As we added *Eight Thousand Copies* to our regular edition on Oct. 1st, we are still enabled to supply Trial, Fifteen Month or Yearly Subscribers from that date.

The American Institute Fair has now been open nearly two months. It has attracted many thousands of visitors. As a whole we do not think it as good an exhibition as last year. It contains few novelties, but it contains much that will interest the student of American Industry who is intent upon watching its progress and knowing, in detail, what it is accomplishing. The Fair has reached its climax of excellence, probably. But a few days remain ere it closes. One interesting feature has been the large exhibitions of the products of the Western States and Territories—grown along the lines of the railways which have received land subsidies from the Government, and which are interested in getting those lands settled, and therefore take pains to show the excellence of these products. The Northern Pacific, Kansas Pacific, and Burlington and Quincy railways have been represented here by a great variety of the products of the regions they respectively traverse. These prove the capabilities of the soil, the adaptation of the climate, and the richness in resource of these portions of the public domain. Kansas has also been represented by a fine display of fruits made by its State Horticultural Society. Such exhibitions produce the effect intended upon those who intend to go West; they enlarge our knowledge of undeveloped wealth of the country, and do much to disseminate correct information by developing a spirit of inquiry among those who have capital for investment. As we have said before, the Fair is doing good; and those who profit most by it are those who use it as a means of advertising, regardless of the prizes that may be offered and awarded.

Late Post-Office Rulings.—D. H., Sherman, Texas, writes that the post-master at that place refuses to receive packages of any kind weighing over twelve ounces, even if letter postage is paid thereon. This is certainly a step a little ahead of the late outrageous rulings of the Post-Office Department at Washington. If we were residing at Sherman, we should certainly demand that the post-master show his authority for refusing to receive packages of mailable matter weighing over twelve ounces, because no such instructions have been sent out from the Department. Under such a law books weighing over the number of ounces named would be excluded, and why not? and the law allows us to send anything by mail, provided it is not of a nature liable to injure other matter with which it comes in contact, if we will pay *letter* postage thereon; but late rulings of the Department, or some subordinate clerk, has limited the weight of packages containing plants, seeds, minerals, and samples of goods, to twelve ounces, and the rate of postage fixed at two cents for every two ounces or fraction thereof. This is virtually an exclusion from the mails of seeds and plants, because doubling the rates of postage, and reducing the size of packages from four pounds to twelve ounces, will prevent, in a great measure, the use of the mails by our seedsmen and nurserymen. We know, however, that the Congressional Committee, who had this matter in charge, never intended that the law should be so construed as to change the postage or restrict the weight of packages of seeds and plants; but it seemed to be desirable to allow samples of goods, minerals, insects, and other things which were formerly excluded, or made to pay letter rates, to pass in small packages at book rates, or two cents for every two ounces; and this change was made in good faith; but the authorities in the Post-Office Department have construed this law to suit themselves and sent out rulings accordingly. This is an outrage upon community, and we are confident that it will be righted as soon as Congress meets again. Our agriculturists and horticulturists will not patiently submit to any such action of their servants at Washington—at least we hope they will not, if for no other reason than to show that the people, not their servants, are still masters.

Our Paper and Premium are Appreciated—As the letters we daily receive abundantly testify. For example, in remitting for the RURAL and Premium Engraving Mr. ARTHUR J. COLLINS of Perth Co., Ontario, Canada, writes:

"We are all delighted with the RURAL NEW-YORKER, and like it still better in its new form and dress. It seems if possible to grow better all the time, and your liberality in offering such a picture as a premium must at once convince all that it is the best and cheapest paper out. Hoping that you will receive the inclosed $3 safely, and that you will continue to prosper, I remain," &c.

Mr. D. FROTHINGHAM of La Salle Co., Ill., in a letter ordering the "Model Paper and Beautiful Picture," says:

"If I am too late to receive your Engraving, 'Birth-Day Morning, or the Gardener's Present,' I shall be sorry, *for it is as natural as any thing can be and not breathe.*"

—Yes, it is both natural and beautiful—of which we hope to convince some tens of thousands of sensible and discriminating people, ere long.

Producers and Transportation in California.—The statement is made that the wheat crop of California will be worth $27,000,000; but by a combination of State freight lines, a shipping monopoly and San Francisco speculators, $5,500,000 of this sum is to be absorbed for transportation. As things are now fixed by this combination, it costs less to ship a car load of wheat from Council Bluffs, Iowa, or St. Paul, Minn., to New York, 1,500 miles, than it does over the Central Pacific lines, 200 miles. And when the cargoes are landed at Vallejo or Oakland, it costs from $5 to $6 per ton more to ship it by way of Cape Horn to Liverpool than it did five years ago. The wheat crop of California in past years has been conveyed to Europe at less than the average of $17 per ton. This year freights are kept up to $23 and $24 per ton, and only because of the combination. If California wants more agricultural population, this is a story that will quench the desire of emigrants somewhat.

The Horse Epidemic, which has prevailed so seriously in Canada, has extended, during the past week, with wonderful rapidity. New York City, Brooklyn, Albany, Boston, Oswego, Buffalo, Rochester, Chicago, St. Louis, Portland, and many intermediate places are suffering from it. Elsewhere we give some of the preventives and remedies which have been recommended. Our readers will understand the importance of watching carefully for the first symptoms of the disease, and of immediately withdrawing the animal from work, giving rest, good air, pure stables, perfectly deodorized. It places the industry and commerce of the country in a grave and embarrassing position, deranging business seriously by the withdrawal of so much operative force from active service. But it is far better that there should be a temporary embarrassment of this sort than that there should be a loss of the animals entire, consequent upon exposure and want of rest.

The Conventions at Indianapolis.—We trust breeders who should be interested will not forget the two important conventions to be held at Indianapolis, Ind., during November—the National Swine Breeders' Convention the 20th, and the National Short-Horn Breeders' Convention the 27th. These are both to be important conventions. Delegates to both have been appointed from several of the States, and we are assured there will be gathered at each, breeders in sufficient numbers to furnish the public with matters of importance as the results of their deliberations.

Tobacco Rotting in Connecticut.—We learn that while the quantity of tobacco grown in Connecticut was large, the quality good, and it was gathered in good condition, the moist weather of September has resulted in "pole sweat" to such a degree that in a large number of cases the leaf has actually rotted, and the loss from this cause will be, it is feared, very extensive.

The Importation of Horses from Canada has been interdicted by the Secretary of the Treasury to this extent:—He has instructed the Collectors at Rochester, Buffalo, Burlington, Cape Vincent, and Port Huron to allow no horses to be brought into their respective ports or districts from Canada, unless perfectly satisfied that they are free from contagious diseases.

RURAL BREVITIES.

WILLIAM BARTHOLOMEW should advertise his horse-power for churning, etc., in a legitimate way.

WE are indebted to Mr. I. W. SANBORN for copy of the Governor of Vermont's Annual Message.

FRANCE, Belgium and Holland are exporting large quantities of potatoes to England, to supply the deficiency of the crop there.

ST. JOSEPH and Benton Harbor, Mich., are reported to have shipped 800,000 baskets of peaches the past season, bringing $400,000.

R. S. KING asks where Peruvian guano can be obtained and at what cost. Our advertising columns should answer such questions, if they do not.

THE Vermont Agricultural College fund, amounting to $135,000, is all invested in the Registered Loan of the State, and yields an income of $8,130.

PROF. H. E. COLTON has resigned his position as Agricultural Editor of the New York World, and accepted a similar position on the New York Times.

J. B. RICHARDS asks where he can obtain Berkshire or Essex swine. Let those who have them for sale take notice, and let Mr. RICHARDS watch our advertising columns.

SOME Michigan fruit growers sent Queen Victoria, last year, five barrels of fine apples. This year the Queen has sent an order to Michigan for seventy barrels for Winter use.

CORN COBS are an article of merchandise in request at Paris, and several New England firms gather them for shipment. After saturation with tar and resin they are used for kindlings.

THE Plow and Cultivator Manufacturers at Rock Island, Ill., have determined to increase the price of plows and cultivators five per cent., in consequence of the increase in the price of iron.

CHAS. V. RILEY, State Entomologist of Missouri, has been delivering a course of Entomological lectures at Cornell University, which are very highly spoken of by those who listened to them.

AS a measure of precaution against the spread of cattle plague, the Danish Government has prohibited the importation of cattle, sheep, hides, leather, and even of hay and straw from Great Britain.

NO MATTER who is elected President, whether GR—— or GR——, thousands of good people, who don't take it now, will want the RURAL NEW-YORKER for 1873 to aid them in their industrial pursuits and as a fireside journal. So, as soon as you can say, "Election is Past, Peace Prevails, and the People are Prosperous with GR—— as President," go for those thousands and secure their subscriptions.

PUBLISHER'S NOTICES.

TO EVERY READER!

HINTS, REQUESTS, SUGGESTIONS, ETC.

The Premium Picture is sent to All who pay $2.50 for a copy of the RURAL one year, and *not to those who only pay the club rate.* Club subscribers can secure the Engraving, however, by adding 50 cts. to the usual club price ($2.) Don't forget this.

Our Premium List was published in last number (page 271,) but we will send copies in other form, together with Show-Bills, Supplements, Specimen Numbers, &c., free to all actual or intending Club Agents desiring such documents for canvassing.

Begin Clubs Now!—And to all who want the paper from date, or either one year (at $2.50) or 15 months (at $3) from Oct. 1, we will send the paper accordingly, with Premium Engraving post-paid. The whole club can start at one time, or part Jan. 1st and part earlier. Note this fact.

The Campaign Opened!—Many Agents have already opened the RURAL Campaign for 1873, while hosts are sending for Specimens, &c., probably with the view of starting on Election Day (a good time, by the way,) or soon after. All right, friends!—That's the way to win Premiums easy.

Attention, Officers of the Rural Brigade!—All Rural Recruiters are Richly Rewarded—vide offer to Club Agents—and there is "ample room and verge enough" for thousands of new recruiters (club agents) to aid in swelling the ranks of the good old RURAL BRIGADE. Our bounties to both officers (Agents) and privates (Subscribers) are most liberal—for every one of the former who gets up a club receives a Valuable Premium, and each of the latter a $5 Picture! Recruiting and Enlisting Papers sent free to all applicants. Why not send for them at once and open the Campaign?

Biographical.

MRS. A. H. LEONOWENS.

BY FULLER-WALKER.

STATEN ISLAND, like an emerald in the mouth of the Hudson, is sometimes called "the gem of the sea." If such a beautiful, water-surrounded spot was near London, Paris, or any European capital, it would be covered with the residences of the wealthy, laid out in wide drives and inviting parks, adorned with statues and fountains. Nature has been so prodigal with her beautiful scenery in the vicinity of New York, the fashionable tide of home-seekers in the country has set up the Hudson, or over into the vales of New Jersey. Along the Western shore of Staten Island there are many pretty vine-covered cottages, great tree-embowered villas, and a number of clustering villages. But most of this American Isle of Wight is abandoned to the fever and ague, German beer-gardens and breweries, and deserted houses "to let." To our fancy this island is just the place for poets, authors and students to reside; quiet, enchanting, beautiful, shady and breezy, and within easy striking distance of the Metropolis, with its art galleries and collections of books. Other men seem to have been of our mind, for here we find the homes of C. P. CRANCH, the latest translator of Virgil; GEO. WILLIAM CURTIS, Mr. BROOKS, who has recently given the public his delightful account of a round-the-world trip between covers, and the subject of our sketch, Mrs. A. H. LEONOWENS, the author of "The English Governess at the Siamese Court," as well as of other works, some of which are yet to be published.

Climbing a gentle hill, from the New Brighton landing, we reach, after a short, maple-covered walk, Mrs. LEONOWEN'S cottage, standing almost within the shadow of a church, so quaint in roof and pinnacle, it might easily be mistaken for a temple of Buddha. The evening is clear, cool and beautiful, with a wholesome breeze from New York Bay. The sun has drawn upon the heavens a glorious cloud-view of gorgeous colors, and sunk behind Newark Bay, tinging its waters a golden crimson. Up and down the Kill Von Kull numerous steamboats and barges ply, displaying their red, green and yellow lights, while white-winged schooners and yachts dart past Constable Hook and Bergen Point.

When Mrs. LEONOWENS saw Staten Island for the first time, coming through the Narrows on board an English steamship, in the Fall of the year, when the trees were robed in their rainbow dresses, she thought she had never seen so beautiful a spot—such a Paradise on earth. She was fresh, too, from the gorgeous Orient, and from green, garden-kept England. Now she sits upon her plazza, and after a weary day with the pen, or her books of Sanskrit, rests the eye and mind drinking in the lovely landscape spread out before her.

She was born in a quiet little village in Wales, some forty-three years ago, where the old folks were so good they thought it a wicked thing for children under fifteen years of age to read newspapers. As regards some newspapers they were doubtless right. She comes of the famous OWEN family, already celebrated in the world of letters, the LEON name having been prefixed out of regard for one St. LEON of Spain, who married an heiress in the OWEN family. As a girl she gave no indications of becoming a traveler, an author, or a Sanskrit scholar. Having married an officer of the British army when quite young, she accompanied him to India, and was in that country during the dreadful Sepoy rebellion.

Although a cousin of hers shot his own wife rather than have her fall into the hands of the rebel soldiers, her sympathy was with the natives of India during the terrible struggle. From the position she occupied she could look behind the scenes and discover how little justice there was in British rule in India. After the war her husband, like many of the other officers, employed most of his leisure time in hunting, being constantly on the camel's or elephant's back. During a tiger hunt he was killed, and she was left a widow with two young children dependent upon her for support.

We have all smiled before now at the thought of little Saint THERESA going out to seek martyrdom in the country of the Moors. Many of her friends smiled when Mrs. LEONOWENS decided to accept the invitation of His Majesty S. S. P. P. MAHA MONGKUT, the Supreme King of Siam, who was in "good pleasure," and wished for an English lady to live in his Grand Palace at Bangkok, to undertake the education of his fifty-four "beloved royal children." To go to a land where white elephants are worshiped, where women are soldiers, where they burn the bodies of their dead and where the king is set down in Christian geographies as an "absolute despot" and keeps a tremendous harem, to which BRIGHAM YOUNG'S cannot hold a candle, was considered to be a rash undertaking which would cost the adventurer her life. The poor mother, besides, had to leave her little girl behind, which was the hardest sacrifice of all. But a domestic reality stared her in the face, and she must lead, perhaps, an epic life, beyond herself, for the sake of those dearer to her than her own life.

KING OSCAR II.

Mrs. LEONOWENS arrived in Siam in March, 1862, and for three years thereafter led a life of singular romantic interest, until she found her health breaking down, through the influence of the enervating climate and the arduous duties imposed upon her. Just before reaching Bangkok she was received by the Prime Minister of the Kingdom in such a bluff, insolent, and unlooked-for manner, that any less determined and courageous woman would have been discouraged, and turned back. Once settled in the King's palace, life went tolerably smooth, since its very novelty so occupied the mind minor disappointments were crowded out. If the Siamese were strange to her, she was equally an object of intense curiosity to them, in her unthought-of European costume, which at that time consisted of a full-blown hoop skirt. The slaves of the palace crept on the floor to discover if she had feet like ordinary mortals, while the women felt of her carefully, and asked how she managed to grow so large downwards. Her European nose, which was longer than the flat nose of Siam, was an object of interest, and she was asked if she pulled it out and adjusted it every morning!

She has related at length in her works the romantic story of her daily life at this Asian Court, telling us of the great harems of the King and his ministers; the strange position the women occupy in the army and in the courts of justice; of the religion, manners and customs of the people, etc. Having been a close student, and keen observer of the people, under the most favorable conditions, she has been able to give the world much new and useful information. "You must draw a darker picture of the Siamese," whispered a good Quaker lady in Boston, to Mrs. LEONOWENS, "or we shall be unable to raise any more money to send missionaries to them!" There are those who half believe that she has been converted to Buddhaism, because she has discovered many beauties in it, and has made them known. While in Siam she studied Sanskrit under native teachers; she looked into the history of the country and read its holy books; she listened to its legends; became familiar with its literature and art; observed court life and returned to Christendom with a fund of valuable information, which she is now engaged in giving to the public through the press.

Before she left Bangkok she had won the confidence of the King to such a degree that he frequently intrusted her with State papers, sought her advice upon important matters and regarded her as his private secretary. That she might occupy a high place at court he made her a lady of rank. The young princes became attached to her and the present King of Siam, a young man of good education, who reads and writes English, is fond of Mrs. LEONOWENS, with whom he corresponds, and is inclined to take a civilized view of life. "We do not want to be converted to Christianity," wrote the old King, "for Buddhaism teaches the power of truth and virtue." They want civilizing, and many changes in that direction have taken place since Mrs. LEONOWENS exerted such a powerful influence at "headquarters."

In appearance she is of the medium height, of slight build, with a pale complexion, black eyes, and dark hair which curls. She is exceedingly fluent in conversation, very easy in her manner and possessed of a quiet dignity which commands respect. Having reached England in poor health, her physicians sent her to America for the benefit of our clear, dry, bracing air. This she found in the mountain village of Catskill on the Hudson. With return of health she took up her residence on Staten Island.

KING OSCAR II.

Our readers will remember that a few weeks since we announced the death of the King of Sweden and Norway and the enthronement of his successor, King OSCAR II., hitherto styled Duke of East Gothland, and holding the rank of Lieutenant-General in the Army and Vice Admiral in the Navy. He is the brother of the late king, and is known to be a Prince of enlightened and refined mind, a man of earnest benevolence and philanthropic effort and objects. In this respect he resembles his father, King OSCAR I., and is said to be devoid of that spirit of gallantry and adventure which distinguished his late brother, CHARLES XV. He is 43 years of age, having been born Jan. 21, 1829. In 1857 he married Princess SOPHIA of Nassau, daughter of the late Duke WILHELM of Nassau, by whom he has four sons, GUSTAVUS, OSCAR, CHARLES and EUGENE. We give herewith an excellent portrait of him from a recent photograph.

MEN PERSONALS.

THOMAS BUCHANAN READ, the poet-painter, was asked one day if he had ever met TENNYSON. "I have," he replied, "and that just after the battle of Bull Run. TENNYSON came hastily into the club room in which I sat, and said:—'Great news! the Southrons have beaten the Yankees, who have fled precipitately from the field.' I could not relish this kind of talk from an Englishman, and replied:—'Well, Mr. TENNYSON, if the Southrons have run the Yankees from the field, it was an American victory, anyway. It is more than your countrymen ever did.' TENNYSON did not answer, nor did any other Briton present. The arrow went to its mark."

"TENNYSON! why," said READ, "he looks no more like a poet than does a lobster if compared with a gold fish. Angular, awkward, with great hands and feet, and coarse hair streaming away, he is not the man that a romantic lady would die for."

JOHN TYNDALL is thus described by a Boston correspondent: "You see a man of somewhat more than medium hight, lithe, quick-motioned, muscular, but slight rather than stout; with a face of somewhat clerical type; brown hair brushed across a broad but not high forehead; keen, bright, pleasant eyes, over which he has a trick of now and then dropping the lids completely, for a sentence or two; straight, rather large nose; clean-shaven lips, not curved at all, but large and flexible; a chin slightly retreating but by no means weak. This face is surrounded by a thick fringe of grayish beard—a most agreeable face it is, but not handsome. Some one said of women, 'They don't make 'em pious and pretty both;' so I suppose scientific and handsome would be too much."

THE last moments of the late King CHARLES XV. of Sweden, were remarkably interesting. Up to the morning of his death none had anticipated his speedy dissolution. Alarming symptoms appearing in the afternoon, his relatives were sent for. The strength of the King diminishing, he said to the physician, "Do you think I shall live through the night?" The doctor replied he did not think His Majesty could count upon it. "Do you think the pain will be excessive?" asked the King. "It is possible you will pass away quietly, for the work of death is almost finished," was the reply. The King received this intelligence with manly tranquility and took leave of his friends and attendants. He then asked the doctor if his finger nails showed the signs of approaching death. "Your Majesty ought not to anticipate," said the doctor. "Perhaps there is no more pain in store for you." The King remained motionless looking at his hands, watching the progress of death, when he stretched out his arm—"How much pulse have I?" "Forty." "So much still?" said the King with a sigh. He put his hand on his neck and said:—"I do not feel cold here yet." This was the last sign of life. At five minutes past nine o'clock the doctor said: "Our King is dead!"

WM. A. WOODWARD has brought suit against EZRA CORNELL, the founder of Cornell University, to recover $117,000 for services and expenses alleged to have been rendered and incurred in locating government lands guaranteed the University. Mr. WOODWARD claims to have located over a half-million acres of land, for which he was to receive thirty cents per acre; he also claims to have paid large amounts for taxes on land, agents fees, wages of laborers, etc. The case is now on trial before a referee.

REPORTS were once current that the late JAMES GORDON BENNET kept a voluminous diary, but it is now understood that he kept nothing of the kind. His papers are not in a condition for publication in any form. This is to be regretted, as an autobiography of him would be rare and interesting reading.

SENATOR SUMNER has had a number of dinners given to him in Paris, and has attended one of President THIERS' receptions.

M. C. MITCHELL, the new Senator from Oregon, is only 36 years old, the youngest member of the Senate.

JAMES WATT is to have a monument at Greenock, Scotland.

THE OLD HOME.

AN ENGLISH POEM.

YES, still the same, the same old spot;
The years may go, the years may come,
Yet through them all there changeth not
The old familiar home.

The poplars by the old mill stream,
A trifle taller may have grown;
The ivies round the turret green
Perchance more thickly thrown;

Yet still the same green lanes are here
That brought their violet sets in Spring,
And heard through many a golden year
The winsome echoes ring.

Of children, in the April morn,
Knee deep in yellow cowslips' bloom;
Of lovers' whispers lightly borne
Through sultry twilight gloom.

And out upon the red-bricked town,
The quaint old houses stand the same;
The same old sign swings at the crown,
Ablaze in sunset flame.

Yet still 'tis not the same old spot—
The old familiar friends are gone.
I ask of strangers who know them not;
All strangers, every one.

The morning brooks may sing the same;
The white thorns blossom in the May;
But each long loved, remembered name
Has passed in turn away.

Our Story-Teller.

THE LITTLE SISTER.

CONCERNING THE COURSE OF A TRUE LOVE WHICH DID FINALLY RUN SMOOTH.

BY MAY WHITNEY HALL.

[Concluded.]

CHAP. II.

As a general thing I am not much given to laborious analysis of anybody's character, not excepting my own; but, for one reason or another, I had studied SARDANAPALUS SIMPKINSON'S pretty thoroughly, and had reached the conclusion that he belonged to that very limited number of rare creatures who, like WASHINGTON IRVING, fancy it a proof of superior virtue and manliness to harp on one string all their mortal days. They are unwilling to let Nature take her own gentle course with them, but go moping about in sackcloth and ashes and will not be comforted if their one baby passion miscarries. Forgetful that infancy is subject to all sorts of epidemics, not the least of which is "first love," they will persist in believing that the first pure and ardent passion of boyhood is the only love worth possessing. This beautiful, true theory may apply to the few persons who advocate it, but it won't do for the rest of us. Whether the confession redounds to our glory or not, Cupid has left more scars with most of us than chicken-pox ever did, and his wounds have healed as easily as mere pin pricks. Before the Dolly Varden fever raged so fearfully among the fair sex, the prevailing epidemic was "disappointed love"—a disease which rather tends to increase the attractiveness of our "weak sisters" and translates them from plain, unvarnished prose into most delicious poetry; but broken hearts in masculine breasts always have been and always will be unfashionable and unlovely.

I would not have you think that SARDY belongs to this unfashionable minority; but his blood-pump was in such a dilapidated state that I felt it imperatively necessary to haul him off for immediate repairs. The only question had been:—Who is worthy to be troubled with this delicate "job?" Who is skillful enough to put in order this most intricate piece of mechanism—this rare specimen of GOD'S handiwork—a human heart? No doubt *you* think me a cold-blooded automaton sort of creature, but I assure you I was all pity and sympathy and tenderness and hope for SARDY, and I meant well if I did make a slight mistake in my reckoning.

I am indebted to the widow of my ninety-ninth cousin for the answer to my question.

"Who," she said, "is so likely to succeed in this great undertaking as the person who made that heart a wreck in the years gone by? *She* knows every twist and turn of it, and can go through it again with the ease of its natural fluid! Besides, having long ago repented the evil deeds of her girlhood, she pledges herself to a life of earnestness and fidelity in his service. Why not permit her to try her hand with him once more?

Why not, to be sure? I looked at the speaker, and satisfied myself, for the ten-thousandth time, that JOSEPHINE PELHAM, relict of the late CHALKER, and the identical coquette who drove the innocent Sardine frantic fifteen years before, had proved more than a match for fate; that ten years of married misery, instead of blighting her beauty, had bestowed a womanly dignity, combined with a touching pensiveness of manner, which, to my taste, was far more fascinating than her earliest bloom. She was tall and stately, rather voluptuous in form, with a queenly carriage; a brilliant conversationalist, a superb singer, a skillful pianist, and a tolerable housekeeper; in a word, I saw the very woman to rule in, and reign over, my friend's heart and home.

I had never doubted for one moment the success of our conspiracy; it seemed impossible that a man like SARDANAPALUS SIMPKINSON could resist the all-persuasive charms of my magnificent JOSEPHINE, whom he had loved so madly in his youth, and for whose sake—cruelly as she had treated him—he had renounced all thoughts of matrimony. I was not a little shaken, however, by that "moving tableau" in the front porch the day of our arrival. A week or two elapsed before JOSEPHINE was presentable, owing to that most unfortunate slip of the tongs; and as these "moving tableaux" were the chief features of every day's pleasuring, in spite of JOSEPHINE'S frequent and rather malicious demands upon the services and society of the little sister, and heedless of my most energetic remonstrances against such unwomanly trifling with the affections or imaginations of babes, it is impossible to deny that their Romeo-and-Juliet-istic attitudes were horribly pretty and becoming, as well as agonizingly destructive to our pet plan.

What tortures JOSEPHINE must have endured during those few days of waiting for her *hauque* to grow! I was annoyed and chagrined at the turn of events; but the way that injured and suffering woman took the matter to heart was something quite appalling to behold. Whenever the offending couple chanced to pass her windows, which they frequently did, on their return from wood or field or river ramble—he apparently all enthusiastic admiration and devotion, and she all smiles and blushes and delight; he seeming to have lost his fifteen years of manhood, and become once more a boy, innocent, merry, and confiding, and she appearing to have suddenly blossomed into womanhood, yet somehow retaining her girlish grace and fearlessness—then my JOSEPHINE would grow white, and wring her hands until the poor little white knuckles cracked again, and walk the bounds of the prison in which her vanity had confined her, and give vent to her uncontrolable passion in expletives more forcible than elegant.

"The heartless, unprincipled fellow!" she would exclaim, with true womanly logic. "How dare he flirt so abominably, right under my nose, and with my own little sister, too?"

"But," I would meekly interpose, "you forget that poor SARDY is utterly unconscious of the near proximity of that precious Grecian proboscis of yours! Only let him become aware of *that* delectable fact, and I promise you he'll drop your little sister like *un pomme de terre* too highly charged with calorie! There he goes now with pretty FLORIAN tucked under his arm, as blissfully ignorant of her relationship to *you* as though he had unearthed her with his own facial protuberance from the bowels of the Sphynx! Fling open your window and prove that your nose is sharper than a two-edged sword, even to the dividing asunder of romantic lovers!"

"I can tell you *one* thing, JOHN CHALKER!" and she poured out the remainder of her wrath on my devoted head:—"SARDY SIMPKINSON never would have tormented me as *you* have done for a week—never! I *do* believe you wish him to get in love with FLORIAN just to spite *me!* But you'll not succeed. I'll shut that child up in the garret and he shan't see her again this Summer, so I will!" Tears in torrents.

"That's right! Glad to see you alive to the importance of immediate action. Have her up in the garret by all means! It will be such a fine opportunity for FLORIAN to display her lovely English chirography in numerous little epistles to SARDY, in which she will dignify your memory by such titles as 'Horrid old thing!' 'Jealous old ogress!' etc. And it will afford SARDY a delightful chance for exercising his long-mused climbing apparatus! Why, he would go up the side of this old house, covered as it is with half a century of vine growth, as easily as the two would afterward ascend the marble staircase in Gorham. Put her in the garret, by all means, if you want an elopement in your family. There's nothing like a little healthy opposition to stimulate a couple of triflers into downright earnest lovers!"

"Well, I'll send the ungrateful little minx home by the next train; Aunt SUE shall begin packing her trunk at once!"

"Better still; for SARDY will spring into the phaeton and embark with her, leaving us without further trouble to enjoy each other's smiles and tears undisturbed. The little sister will create a sensation in the metropolis, I can assure you, as there is a great demand just now for yellow hair and blue eyes. Dr. S. and his young bride will, no doubt, go abroad next Winter; while JOHN CHALKER and the antiquated JOSEPHINE will quietly 'settle' in some obscure corner and atone for their past misdeeds by practicing all the 'cardinal virtues' with commendable 'puppy-at-a-root-iveness.'"

"Not *quite* yet, my good coz;" retorts she, laughing, in spite of her anger and disappointment. "If the antiquated JOSEPHINE has the honor of her own acquaintance, she won't scuttle this ship without another struggle or two. It will be time to talk about the 'cardinal virtues' when every thing else fails. Just now the question is, what shall I wear to dinner? The Sardine, I remember, used to like blue; but that's not admissible now. What say you to this lovely purple and black *crepe moaette*, with purple pansies on my forehead, to cover up the *hauque? Est-ce tout?*"

"*O oui, oui, Madame; c'est trop magnifique!* Poor FLO., in her bedraggled white wrapper, will look like 'a little faded flower' in comparison! I feel compelled to suggest, however, that SARDY hates purple, and adores simple white dresses, and that his favorite song is that same 'Little Faded Flower!'"

"Then I'll sing it for him after I've compelled his eyes to admit that purple is the most royal of all colors, and the most suitable one for the Queen of his affections to wear. How about this ugly scar on my forehead?"

"Fringe your frizzle down over it, and be in the fashion for once! You've forehead enough and to spare when that much is concealed. And if you ever *could* be induced to change your mind, I'd go down on my knees and implore you to banish the purple crepe, which makes you look precisely like the stereotyped widow who desires to change her condition, and that immediately, and wear instead that lovely white polonaise (or whatever you call it), trimmed with those delicate ruffs of illusion, which will so remind our friend of his early condition that he will yield to your pensive attractions without a sigh of regret. Now don't shake your head; you *shan't* wear that ugly purple stripe. Here it goes into the attic!" And I deliberately walked off with what I supposed to be the principal part of it; but just before the dinner bell rang, down she came, with the white polonaise floating like filmy clouds over a sea of purple underskirt, and I was obliged to confess that I had never seen anything so superb since her wedding day.

Our trouble was in vain, however, for we had no Sardine at dinner. We waited soup an hour; we lingered over the fish until the baked meats were burned to a crisp; we delayed the vegetables until they were indescribable; and just as the desert came tardy off, little FLO. crossed the lawn alone, her eyes red with weeping, and her manner betraying great agitation. We could elicit nothing from her except that Dr. SIMPKINSON and herself had "had a little talk," and that he had left her, two or three hours before, in the Alder Grove; and that she supposed he was "at home with JOSEPHINE" long ago! Nothing more satisfactory could be elicited from the child, and she was sent dinnerless to bed by her imperious sister, while I was as imperiously detailed to meander along the river bank in quest of my impetuous guest.

Evidently, thought I, he has by some accidental question discovered little FLO'S relationship to JOSEPHINE, and, angered by the deception practiced upon him, has repudiated her—and thus her tears. Or perhaps, learning the near proximity of his early love, he is so overwhelmed by old memories that he dare not appear in her presence, especially after this flirtation with the little sister. Or, more probable still, he has fled from both of them to avoid the unpleasant scene which is sure to take place soon or late.

After wandering about a couple of hours without finding my friend hanging his harp of life on any of the convenient willow boughs, or doing any other desperately romantic thing, I went back to the house to report; and through the long, low parlor window I saw the truant enter and make his bow to JOSEPHINE, who sprang forward to meet him, her handsome face aglow with smiles, her hand eagerly extended to clasp his own, her crimson lips trembling with excitement. Now, thought I, there'll be a scene worth witnessing. You'll think it very unmanly in me, but I was so overcome with surprise, delight and curiosity that I slid in among the vines, constituting myself an audience, which, I fancied, knew how to applaud at the right moment.

"What a charming surprise!" SARDY began, meaning, no doubt, to meet her with all the *au fait* airs of a heartless man of the world, but the sight of those clear brown eyes, the well-remembered smile, the touch of that little palm annihilated society "varnish" and left the bare, bleeding, bitter man, who recoiled from her with a face so pale and stern that it made me shiver to see it.

"May I ask for what purpose I am again betrayed into your treacherous hands?"

There was a vibration of passionate scorn in his face which made her eyelids droop, her poor little slandered hands drop nerveless at her side, while a lurid spot burned in either cheek.

"What does it all mean?" he rushed on, impetuously, his formidable will proving but a slight barrier to his rising anger. "Would you play the old tragedy over again, JOSEPHINE? Is it not enough that you made a desolate ruin of my happy boyhood, that you poisoned every pleasure which youth and hope held out to me, that you made me a scoffer, a miserable, heartless trifler, as base a worldling as ever disgraced GOD'S beautiful earth? What more do you ask? Come, speak your purpose!"

Now, if I had not known that JOSEPHINE'S whole heart was bound up in the ungrateful wretch, I should never have guessed it from her manner, or her words. By this time she had recovered her self-possession, and stood before him to all appearance as unimpassioned as a statue. She knew perfectly how desperate a game she was playing and with what a reckless antagonist. When she replied her voice was as calm, as low, as sweetly indifferent as if her future happiness was not staked on the turn of events.

"I can tell you what my purpose *was*, if you care to know it, but, unfortunately, it has changed within the hour. For fifteen years I have cherished the memory of a generous, light-hearted boy who loved me——"

"It is false!" he broke in almost fiercely: "I *never* loved you! I was enchanted with a fair and lovable girl who seemed to embody my ideal of a noble womanhood. It was the beautiful mask I loved, not the faithless abomination within. My GOD! How I *ought* to hate you!" he cried passionately. "When I think how you have wrecked my past, how you have decoyed me here only to blast my future——"

He broke off with a gasp and sank into a chair, covering his face with his hands as if he could no longer endure the sight of her.

She was silent and irresolute a moment, and two big tears 'meandered' down toward the tremulous corners of her mouth; then she proceeded with her little speech, putting into it an earnestness which must have thrilled him though he had been stone.

"For fifteen years I have been stung by the remembrance of a noble, generous boy whom I had wronged, not knowing how sensitive he was, without guessing how true and manly and constant was the love I slighted, or how poignant the misery I inflicted. It was a girlish bit of coquetry, a frolic which I thought would but enliven the boy's dull days as it had my own. When I realized the full extent of the injury I had done him, I would have done anything to lessen his pangs. I would have gone on my knees to implore his forgiveness. I would have laid my very life at his feet—but he was gone. I could only wait for his return. And I have waited," she continued, in a voice more tender than a turtle dove's cooing, "all these miserable years, I have waited, hoped, prayed for the hour when I could look once more upon that noble boy, grown into a nobler man; when I could throw myself at his feet and beg him to forgive me for that early wrong, as he would be forgiven for his past offences; when I could humble myself so much as to confess——"

But she didn't confess it, for SARDY, whose chest had been heaving uncomfortably during the latter part of her speech, raised his head suddenly, and looked at her with such burning eyes that her lids drooped again, and the lurid glow crept all over the radiant face. He seized those "treacherous hands" and forced her to look at him. "Well, go on! You would have confessed——"

"I would have confessed many things to such a man as I hoped to meet which could never escape my lips in presence of 'a scoffer,' 'a miserable, heartless trifler,' 'as base a worldling as ever disgraced GOD'S beautiful earth!'" she retorted, with a tantalizing smile.

"What would you say to even such a poor sinner if he spewed out of his memory those bitter years, and promised to live his future life out fair and beautiful, as you once dreamed he would? If he said, 'I love you better to-day for all the suffering which we both endured, and which has made us stronger, wiser, and more tender toward the rest of earth's poor sufferers,' what would you say to me, JOSIE?"

I don't know what she said, for I discovered suddenly that I was Monsieur DE TROP. It was too "melting" a moment for me.

"And what is to be done with FLORIAN?" I asked, some hours later, as the happy Sardine smoked the pipe of peace and gratulation with me on the verandah. "The poor child will be heart-broken. You have behaved in a shocking manner to JOSIE'S little sister!"

"Well, I am a little ashamed of that affair; but, you see, I couldn't help it. The little thing reminded me so of JOSEPHINE that I felt all the old emotions reviving, and I imagined I could place the old passion on to the new and be happy once more. So I made myself as fascinating as possible, and when I thought 'the pear was ripe,' I proposed to her——"

"You did?"

"I did, indeed; and what do you think she said?"

"Why, she accepted you, of course; and now the tender little innocent will be sacrificed on the altar of your selfishness! I shall horsewhip you, I know I shall. Won't somebody hold me before I damage this dandy?"

"Don't explode, my festive friend! The little midge won't perish on my account. Why, she had the audacity to tell me that she had looked upon me only as a brother, an elderly friend, or something of that very Platonic sort; and after a deal of teazing on my part, and a small Niagara of tears on her's, I discovered, to my intense disgust, that she cherished a passion for 'bonnie brown hair,' and couldn't abide such grizzled locks as mine—in a word, she couldn't be Madam SIMPKINSON because a certain jolly, generous, handsome, whole-souled friend of ours, named CHALKER, had so captivated her fancy that she——"

I tarried not to hear the rest of the pretty speech, being of the opinion that such a confession would be infinitely more appetizing if made to me by the charming little sister herself, which felicity I enjoyed to the fullest extent before JOSEPHINE and SARDY ended their honeymoon.

SOCIAL SPLINTERS.

A CLERGYMAN, having made several attempts to reform a profligate, was at length repulsed with, "It is all in vain, Doctor; you cannot get me to change my religion." "I do not want that," replied the good man, "I wish religion to change you."

A MARKED change of fare—Formerly we treated those with whom we differed in theology to a hot stake, now we only offer them a cold shoulder!

"WHERE have you been since the cow kicked?" Chicagonians now ask each other.

A VOCALIST was nearly choked recently by his swelling notes.

PAY your little outstanding earthly bills, and don't romance about the falling dues of heaven.

Ladies' Port-Folio.

SERVABO FIDEM.

BY ELIZABETH C. PIERCE.

If in the eyes of my heart's friend
My eyes could look,
And I could read, as 'twere within a book,
The measure of his love for me,
And all his secret thoughts could see,
Love's sweetest part were lost.

If from the future I could draw
The clouds that hide it now from me,
And I could know the things that soon will be
A fulness of great joy or weariness of woe;
If I could guess the gifts fate will bestow,
For me all hope were dead.

If I could see the LORD,
And in His face
Might trembling look, and by His grace
Might touch His hand with mine,
Of His great love that sign
I would hold less than signs which now I have.

I would not know the unknown;
Well content I be
To leave all things I cannot see,
Assured 'twere only saddest woe
If my weak, human heart could know
What GOD hath pitying hid.

EVERY-DAY LIFE.

BY LEAD PENCIL, ESQ.

Profit from Social Parties.

A YOUNG gentleman writes me:—"Would you advise a young man to mix freely in society during the coming Winter, attending social parties, balls, sociables, etc.—devoting his evenings to such pleasures? I confess I have found little pleasure and less profit heretofore in such indulgences." The young man or woman who has no other resources for pleasure than those derived from social "pleasures" such as he refers to, is very poorly off indeed. But I would not recommend either a young man or woman to altogether ignore society. Mingle enough in it to keep posted as to its demands and tendencies, its customs and exactions, so that when it is necessary—as it sometimes is—to enter it, you may do it without embarrassment and awkwardness. But I do not recommend any one to devote all of his or her leisure to what is called "society;" and so far as he or she has influence one should strive to make society yield himself or herself and others profit. There are always, in all kinds of society, some people who only tolerate its frivolities and hollowness. Find such people out and get from them the substantial profit which almost any circle will afford if one has the tact to develop it. But let society be sought only as a pleasant and profitable recreation—for the suggestions and stimulants it will yield in directing mental acquirements. No young man or woman can afford to waste the best years of his or her life in frivolous pleasure. One or two evenings in a week are enough to give to such demand. Let the rest of one's leisure be devoted to study or to the disciplining himself or herself in something that will be of material use to him and his in life. The seclusion from society to this extent will not lose one any influence in society, but rather increase it, if right use of knowledge is made.

Sally Teazle's Letter.

A FARMER'S WIFE, at Florence, Ill., asks where SALLY TEAZLE spent the Summer—whether in thrifty New England or Pennsylvania, both so noted for their good housewives, protesting that she fails to recognize the picture in Illinois, where people of every nation are to be found. I may say, without betraying confidence, that the postmark on SALLY TEAZLE'S letter was that of a New England town. The farmer's wife further writes me that SALLY had no business to be visiting farmers in July and August, the busiest and hottest season; and I again agree with her. Then she adds that SALLY had no business to write me an exaggerated account of her visit to be printed in the RURAL. Probably SALLY will agree to that, but assert that it was *not* exaggerated. And I remember I happened to hear a lady, who was reading the letter, say she had seen many such homes—that "it was a perfect picture." By the way, this woman had been a school teacher, and "boarded round," in a country district. I will add my own testimony—I, LEAD PENCIL, ESQ., who was born and bred on a farm, and lived there a quarter of a century, and have known every-day life on the farm, and every phase of it, more or less intimately, nearly a half century—which is, that while SALLY TEAZLE'S picture may be exceptional, it was so nearly like what I myself have seen and realized in more than one farm house, that I thought it well to hold the mirror up to nature, hoping that thereby some people might see themselves as others see them, and with profit.

I have remarked, during my visits to hen roosts at night, that no sleepy pullet makes a noise until she is caught; nor, during my Autumn squirrel hunts, did I ever know a gray squirrel to fall at my feet until I had hit him; nor could I ever make a rat squeal until I got him in a right place. These are homely but striking illustrations of the moral I wish to convey.

THE famous Mrs. O'LEARY, who owned the cow which destroyed Chicago, is to have a public ball.

WHY TIM JONES DON'T FIND A WIFE.

AS I am a constant reader of the RURAL NEW-YORKER, I could not but notice the "Every-Day Life," by LEAD PENCIL. I am aware that a great many of the young ladies are as TIM JONES represents them to be; but why are women in general averse to farm life? It is because so many farmer husbands are uneducated; and they cannot see why a *woman* should endeavor to cultivate her mental powers. They see no reason why there should be any flowers in a *woman's* life. They expect to see naught there but vegetables.

Too many farmers have very poor libraries, and really think it very foolish to purchase books, as though the growth of the mind was not *equally as important* as the growth of the body. How many farmers' wives to-day are stretching their weary hands heavenward, and praying for more strength! How many, groping for the light of knowledge not to be found in their own cheerless household, are crying for the glorious sunlight that illuminates other homes! How many are looking for some of the heavenly manna to feed their hungry souls!

But laying aside the gloomy picture, remembering it only as a thing of the past, we turn to a more endearing prospect of farm life. (Remember, we look from a woman's standpoint.) We cannot always have a cloudless sky; neither do we expect it. We are not always "wishing to be what we cannot be;" but we are wishing to be what we *can* be—more pure, more heavenly, more noble. We wish to dwell in Paradise, and that Paradise must be *home*—not adorned with costly furniture and magnificent paintings, but ornamented with true love and cheerfulness. That home must contain so much of *real* happiness, that the husband need not resort to the grog-shop to obtain the pleasure derived in the family circle. A PEORIA GIRL.

Peoria, Ill.

WOMAN PERSONALS.

FANNY FERN was a woman of remarkable spirit. She endured her long suffering with great fortitude. When her right hand was disabled by rheumatism, she insisted upon writing her Ledger articles with her left hand, and she continued to perform this task almost to the day of her death. It is said Mr. BONNER has paid her $150,000 for her writings. She was very fond of children, and they delighted in her. In domestic life she was fastidiously neat, and could not write if her table or room was in the least out of order. Though very egotistic in her writings, she disliked to appear before the world in public. She used to be seen nearly every afternoon, about four o'clock, walking on Broadway, or in the vicinity of Union Square, with her husband. She usually spent the Summer in New England, each year in some new retreat, but for the last two Summers she resided in a cottage at Newport. NAST and "DOESTICKS" were both related to her.

MRS. HARRIET PRESCOTT SPOFFORD, and her husband, the Hon. RICHARD S. SPOFFORD, live at Newburyport, Mass. They spend their winters in Washington. The house they live in during the Summer is a hundred and fifty years old. It is quaint and odd—filled with books, pictures and antiquities. Both SPOFFORDS and PRESCOTTS are literary. Miss MARY PRESCOTT, the sister of Mrs. SPOFFORD, and who lives with her, writes stories for the magazines and Harper's Weekly. Mrs. SPOFFORD'S books, stories and poems have a world-wide celebrity. Last Summer Mrs. SPOFFORD wrote for Old and New an elaborate review of JOAQUIN MILLER'S volume of poems. She and her husband are ardent admirers of those poems, and speak highly of the man himself, in spite of his oddities and eccentricities. He was their guest for a month.

IN 1869, Dr. BIGG of Dundee amputated the whole of the extremities of a young woman named ROBERTSON, as they were in a gangrenous condition. After the operation the girl went to London, where Mr. HEATHEN BIGG constructed for her a pair of automatic hands, opening and shutting at the will of the patient. This permitted her to grasp even so small an object as a crochet-needle, so that she has been enabled to support herself comfortably by making shawls, etc. The artificial legs allow her to walk with the aid of crutches. She now writes an excellent hand, besides knitting, feeding and dressing herself. One of her shawls has been presented to the Queen, who sent her £5.

VINNIE REAM has been at work for a week or two, at the Industrial Exposition in Brooklyn, N. Y., modeling in clay the bust of a prominent citizen. She performed the same service last year for the American Institute Fair in New York, making a bust of PETER COOPER. A lady in Philadelphia was so pleased with Miss REAM'S statue of "Miriam," recently arrived from Rome, that she purchased it for $3,000.

THE women have almost taken the New York public by storm, delivering innumerable lectures. After the great Grant meeting held by the women, at which Mrs. Isabella Beecher Hooker, Rev. Miss Olympia Brown, Mrs. Lilly Devereaux Blake, Miss Matilda Josiyn Gage and Susan B. Anthony made speeches, the gates of the Garden of Eden were opened, and Mrs. Leonowens lectured on "Siam;" Olive Logan, on "Successful Men;" Mrs. Vanderpool, on "How Women Live in New York;" Miss Emily Faithful, on "Queen Victoria and the Royal Family," and Miss Swazey and Miss Anna Dickinson on politics. That is very good for one month.

Reading for the Young.

RUTH.

WHAT shall be the baby's name?
Shall we catch from sounding fame
Some far-echoed word of praise
Out of other climes or days?
Put upon her brows new-born
Crowns that other brows have worn?

Shall we take some dearer word,
Once within our circle heard,
Cherished yet, though spoken less—
Shall we lay its tenderness
On the baby's little head,
So to call again our dead?

Shall we choose a name of grace
That befits the baby's face,—
Something full of childish glee,
To be spoken joyously?
Something sweeter, softer yet,
That shall say, "Behold our pet!"

Nay; the history of the great
Must not weigh our baby's fate;
Nay; the dear ones disenthralled
Must not be by us recalled;
We shall meet them soon again—
Let us keep their names till then!

Nay; we do not seek a word
For a kitten or a bird;
Not to suit the baby-ways,
But to wear in after days,—
Fit for uses grave and good,
Wrapped in future womanhood—

For the mother's loving tongue
While our daughter still is young;
For the manly lips that may
Call the maiden heart away;
For the time, yet tenderer,
When her children think of her;

Let us choose a Bible name,
One that always hides the same,
Sacred, sweet in every land
All men's reverence to command;
For our earthly uses given,
Nathless, musical in heaven!

One I know, these names amid—
"Beauty" is its meaning hid;
She who wore it made it good
With her gracious womanhood.
Name for virtue, love and truth!
Let us call the baby *Ruth*.

[*Christian Union.*

A HINT TO YOUNG MEN.

EVERY YOUNG MAN who has a Sister, Cousin, or particular Friend, will find our Steel-Plate Engraving (BIRTH-DAY MORNING, *or The Gardener's Present*) a very appropriate gift to either. From the wording of letters received, we infer that many copies of the Engraving have already been sent to such parties; and as our steel-plate printers are working day and night, we hope to be enabled to supply the future demand promptly—our rule being to fill all orders on the day of their reception. But let it be noted that the early copies are the best, and hence those who apply soon will obtain the most beautiful impressions. "A word to the wise," etc.

OUR LETTERS FROM BOYS AND GIRLS.

About a Fish Pond.

I HAVE been spending the Summer at my grandfather's, on a farm. My papa lives in the city, but I like the country so much better, than to be shut up in the city all the time. My uncle has a fish pond; there are nearly two hundred trout in it. I feed them grasshoppers. It is real fun to see the fish jump out of the water for them. I have been getting a nice collection of butterflies, and have a great many different kinds and colors. I like to chase through the fields after them. I am eight years old, and attend the Normal School in Cortland, which is about two miles from here. I like it very much. My grandpa takes your paper and I am very much interested in the girl's and boy's letters. —EDIE M. P.

A Soap-Box Pet.

I AM a little girl fourteen years of age, and my father was killed in the war. My step-father is a well-to-do farmer and dairyman, and as you have so many pets I will tell you about mine. It is a rabbit, and it is just as tame as a kitten. One day my brother came home (he works out) and brought my "Jenny," as I call her, in a soap-box. We shut the barn door and let her out and fed her before we went to the house, and we didn't tell mother anything about it for awhile, and after awhile we told her we had a soap-box and we wanted her to come and see it, and so we nicknamed it "Soap-Box."—E. M. M.

A Horn Basket.

I AM making a horn basket which I think is very pretty, and should like very much to tell my little friends how it is made. I have scraped the horn, and colored it different shades. Boil the dye, and let it stand until cold, and then dip in your horn. Have your basket pasteboard, cut in any style to suit the fancy; put the scraped horn on the basket with glue, in flowers, or in any way to suit the taste of the person. -CORA E. P., *Pontiac, Erie Co., N. Y.*

To Wild Rose.

THANKS to "Wild Rose" for her kindness in giving me her real name; and if she will publish her name and post-office address in the RURAL, or forward it to me through Mr. MOORE—and wouldn't I like to receive it in her own handwriting!—I will gladly send her the string of beads, as I promised, and as "Wild Rose" requested. With much regard—HARRY HECTOR.

MOSS SAUCERS.

I WANT to tell you about some pretty things my sister ALICE makes for parlor ornaments, every Autumn; and if you live in the country, where there is neither gas nor heated air, you can go and do likewise. In the first place she takes an earthen flower pot saucer, about 1½ inches high and 28 inches in circumference; into this she pours some leaf mold and sand, taking care to heap it up in the middle so that the moss may be nicely rounded. Over the earth she arranges thick green moss, both light and dark, and delicate little clumps of fern, which we find hidden away among the rocks. Now, with a pointed stick, she makes holes in the moss and gives the finishing touch to it by covering it all over with scarlet partridge berries. With their stems in the wet moss they keep fresh and bright from October until April. We give it a thorough wetting once a week and are always careful to place it in a cooler room when a fire is made in the stove. If you can find no partridge berries, you can gather a few white pebbles and some tiny shells and place them among the moss and ferns. GRACE.

EVERYBODY BUT BOB.

HERE is something which shows how honest a young heart may be, and illustrates what may not be exceptional praying among older people than children:—A very little boy, after giving everybody a good night kiss, kneeled at his mother's side to say his evening prayer. He repeated, "Now I lay me down to sleep," etc., and continued, "God bless papa and mamma and make them good Christians; God bless little Jimmie and make him a good boy." His mamma added, "God bless everybody."

At this last sentence he was silent. His mother repeated it a second and third time; when he raised his head, opened his beautiful eyes, and said:

"Everybody but Bob, mamma. Bob drowned my cat to-day."

News of the Week.

CURRENT TOPICS.

The San Juan Controversy Settled.

OUR readers know that there has long been a dispute between the United States and British governments as to the interpretation of the treaty of 1846, defining the Northwestern boundary—the United States claiming the Island of San Juan as within her territory, and Great Britain claiming it as hers. The settlement of this question was pending when the Washington Treaty was under consideration. By the terms of that treaty the San Juan question was left to the decision of Emperor William of Germany, who brought to his aid as Imperial advisers Grimm, Vice-President of the Supreme Court; Kiepert, the eminent geographer, and Goldschmidt, member of the Superior Tribunal of Leipsic. These referees made their respective reports to the Emperor, who has given his decision in favor of the United States. The English papers don't like this award more than that in the case of the Alabama Claims. But the matter is definitely and decisively decided, nevertheless.

That Colored Cadet.

THERE is a colored cadet at the Naval Academy at Annapolis. The fact that he was given a room alone has been telegraphed all over the country—that is, he has no chum, and did not even ask for one! Then, his demeanor at the table, and the fact that he sits between two white cadets has received due publicity. There is no news to prove that he does not eat his food with as much relish as, and digest it like, a white boy. There have been rumors that the white cadets have been insulting him. It is some satisfaction to know, if it were true, that he knows how to behave himself better than white boys do, because there is some hope that they may profit by his example. But we are gratified to learn by a telegram from Washington, that the Department of the Navy have no official information that the white boys have behaved badly. This is gratifying, because it goes to prove that he has not got into bad company.

Right Action of the Secretary of the Navy.

A WASHINGTON dispatch states that Robert D. Diggs of Maryland, a cadet midshipman, met colored cadet Midshipman Conyers on the grounds of the Naval Academy, and, after some words, a fight ensued between them, in which Conyers suffered most. But, it appearing that Diggs was the aggressor, the Acting Secretary of the Navy has issued an order dismissing Diggs from the Academy. If the action of Diggs grew out of the simple fact that Conyers was colored, this action of the Secretary's is justifiable. If the boys educated at Government expense will not learn to respect the rights of others, the Government cannot afford to waste its money upon them; for they will never be qualified to defend and uphold free institutions and the right of one man to be the equal of any other—if he can.

What a Physician Knows about Insanity.

IN a recent murder case tried at Memphis, Dr. J. K. Allen who said he had been for thirty years a physician, and for ten years Medical Superintendent of the Kentucky Lunatic Asylum and had, during that time over 2,000 insane persons in charge, testified:—"The more I studied the question of insanity the less I understood it, and if you ask me where it begins and where it ends, neither I nor any other physician in the world can tell you." That is one of the most sensible statements we ever knew a physician to make. It is so much better than the learned disquisitions upon the operations and phenomena of the human mind usually given as medical testimony in murder trials where a question of insanity is involved.

Currency Expansion Desired.

BUSINESS men from the West are urging Secretary Boutwell to unlock the Treasury and put in circulation the $44,000,000 legal tender reserves which Secretary McCulloch withdrew from circulation, asserting its necessity in the movement of the produce of the West. To this there is strong opposition on the part of those who desire a speedy return to specie payment, because they believe it will delay that event. The pleas in favor and protests against thus unlocking the currency are pretty evenly balanced, and the Secretary has not yet decided what he will do.

France and Italy.

M. THIERS has recently expressed the opinion that the King of Italy is one of the smartest sovereigns of Europe. He evidently holds his opinions in high esteem. But he protests, with great emphasis against his Bonapartist sympathies; and to such extent does he carry this protest that he has requested King Victor Emanuel of Italy to recall Chevalier Nigra, the Italian Minister to France, who, during the recent expulsion of the Bonapartes from France, has offensively manifested his Bonapartist sympathies.

Tweed and Hall.

NEW indictments had been found against William M. Tweed; but he could not be found. All attempts to arrest him failed until one day the past week he appeared at the Court of Oyer and Terminer and gave bail. Meantime the trial of A. Oakey Hall, Mayor of New York, under similar indictments, was commenced, and is now in progress. It is, of course, exciting some of interest in the city.

What Cuban Slaves are Taxed.

IT is found by the Spanish Government in Cuba that its expenditures exceed its receipts $13,500,000. To supply this deficiency it has been resolved not to increase the import or export duties, but to supply the deficiency by local taxation. One mode of local taxation is to impose a tax of $24 on each slave, which will bring in a revenue of about $7,000,000.

A Duel at Atlanta, Ga.

Two young men, named respectively, J. K. Townsend and Houston T. Force, quarreled, and October 18, fought a duel with double-barrelled shot guns loaded with buckshot, at twenty paces. Townsend was seriously wounded. Both were young men, belonging to respectable families. We are not quite willing to believe this the wisest way to settle personal difficulties.

New Ontario Cabinet.

THE new Cabinet of Ontario recently formed by Vice-Chancellor Mowat consists of P. Mowat, Premier and Attorney-General; Adam Crooks, Treasurer; T. B. Pardee, Secretary of State; A. McKellar, Minister of Public Works; and R. W. Scott, Commissioner of Crown Lands.

The Next Pope.

IT is announced that Cardinal Antonio Maria Panebianca, a Sicilian, sixty-four years old, has actually been selected as the present Pope's successor. He not only belongs to the Order of the Jesuits, but is said to have made a vow that he will restore that Order to its former greatness.

THE SEASON, CROPS, PRICES, ETC.

Lowell, Kent Co., Mich., Oct 21.—Corn crop very good; potatoes very late, but think there will be a good crop; wheat, $1.40@1.60 per bushel—injured a good deal by rust and weevil; corn, 40c.; oats a good crop; fruit middling. The fair at Lowell, last week, very poor. Fine Fall weather.—A. E. L.

Lamar, Ottawa Co., Kan., Oct. 16.—The past season has been good enough; people need not complain. Fall wheat killed badly, and what did live through was light. Spring wheat and oats were good; corn and potatoes excellent; all kinds of root crops good. Fall wheat is worth $1.50 per bush.; Spring, $1; corn, 25c.; oats, 25c.; potatoes, 40c.; hay, (wild), $3 per ton. Good horses $150 each; work oxen, $150 per yoke; poor ones are cheap. Good native cows, $40; good butter, 20c. per pound; eggs, 15c. per doz. Good homestead lands here yet, and first-class deeded land can be bought for from $3 to $5 per acre, on time.—H. P. S.

Springfield, Mo., October 21. Weather fine. Have had a few smart frosts, sufficient to kill the cucumber and potato vines. Roses, petunias, artemisias and other flowers are still in vigorous bloom. Crops, generally, have been bountiful. Wheat of excellent quality, oats and corn never better. A splendid crop of potatoes, both Irish and sweet. Fruit of all kinds has ripened well and abundantly. Had a larger peach crop than ever before here. Apples are abundant, and choice pears in moderate supply. Pastures continue good. Cattle are rarely housed during the Winter; a practice, however, not to be recommended to good farmers.—T.

SEMI-BUSINESS PARAGRAPHS.

Chesapeake and Ohio Railroad.—The progress of the Chesapeake and Ohio Railroad is thus stated by an exchange:—It will undoubtedly interest capitalists who have made investments in the Chesapeake and Ohio Railroad Company's first mortgage bonds that the rails have already been laid beyond Richmond Falls, on the New River of West Virginia, about sixty miles west of the White Sulphur Springs. The incomplete gap between the eastern and western divisions of the road, now in operation, is said to be less than forty miles, and will be finished in a very few days. The whole line, from the docks below Richmond to the Ohio River terminus, will be ready for trains in December next. The Company are now making contracts for the delivery of large quantities of bituminous and cannel coal at the seaboard wharves, and have already a large traffic from the mines of the Kanawha to the Ohio navigation. The limited amount of the Company's bonds remaining on sale in the hands of FISK & HATCH, the financial agents, are being rapidly absorbed at the present low rates.

Save Money.—It will worth saving, and you can save it in buying a Sewing Machine, and get one of the best and most perfect machines in existence. The New Wilson Under-Feed Sewing Machine has reached a point of excellence and perfectness equaled by no machine in use, and the constantly and rapidly increasing demand, which is almost beyond their manufacturing capacity to supply, is convincing evidence that the merits and cheapness of this machine are being appreciated by the public. Salesroom at 707 Broadway, New York, and in all other cities in the United States. The Company want agents in country towns.

Watch No. 1259, Stem Winder—bearing Trade Mark "Frederic Atherton & Co., Marion, N. J."—manufactured by the United States Watch Co. (Giles, Wales & Co.), has been carried by me six months; its total variation from mean time being only eight seconds per month. Have been traveling through different sections of the country, from New York to Galveston, Texas, and back by steamer and railroad.—E. RICE, of Whitney & Rice, 179 Broadway, New York.

Facts for the Ladies.—Mrs. J. C. THOMAS, Bloomington, Ill., has used her Wheeler & Wilson Lock-Stitch Machine constantly since April, 1860, making the heaviest and thickest coats, such as beaver cloth. See the new Improvements and Woods' Lock-Stitch Ripper.

Advice.—Send for free Price List. JONES SCALE WORKS, Binghamton, N. Y.

THE MARKETS.

MONEY AND TRADE AFFAIRS.

NEW YORK, Monday, Oct. 28, 1872.

THE trade of the past week was active in Cotton and in Grain and Provisions. The exports of Cotton from this and the Southern ports are on a liberal scale and the receipts at the South quite large—111,000 bales for the week. The exports of Grain and other Domestic Produce from New York are running well, and, while Exchange is thus favorably influenced, the amount of Bills required to cover the collection of November Coupons for foreign account tends to keep up the rate of Exchange to the Gold shipping point. One of our bankers shipped $1,000,000 of American Gold Coin on Saturday. The price of Gold is not affected, as the sums required for export came directly out of the Treasury for November Interest on the Public Debt. The business of the week in General Merchandise was good. The Dry Goods trade is pretty much over for the Fall season.

The demand for Money for Merchant account and from the Banks in the South and West that correspond with New York is very active, and, although our banks let out nearly $4,500,000 last week, the state of their lawful Money reserves will not allow them to afford all the relief required. For these purposes the Street rates for Money on all time engagements are 8 to 12 per cent. The Stock Brokers for loans strictly subject to call are only 6@7 per cent.

The Stock market has been buoyant, and higher on the New York and Western Roads, and on Pacific Mail and Telegraph Stocks. Part of the advance is lost to-day, although the reaction is not of a serious nature. The Pacific Mail Company have filled up their Capital of $20,000,000 by selling 27,000 shares of the Stock for some years held in reserve at par value. The Telegraph Stock and Northwest Road were also in especial favor during the week, at a large advance on previous prices.

The following are the comparative movements of the City Banks for the past fortnight:

	Oct. 19.	Oct. 26.
Capital	$88,019,200	$88,019,200
Loans	270,557,600	274,925,000
Gold and Greenbacks	65,171,500	63,137,400
Deposits	200,031,400	203,202,400
Circulation	27,706,300	27,686,000

PRODUCE AND PROVISIONS.

NEW YORK, Monday, Oct. 28, 1872.

EVERYTHING that depends upon truck and wagon transportation through the city is altogether checked, so far as any wholesale trade is concerned. Receivers, since the prevalence of the horse distemper that has laid up the greater portion of teams, have been impelled to leave property at the wharves and stations, while their surplus stock remains in their stores almost untouched, through the absence of grocery and express teams. Some buyers are moving by hand a few goods, such as eggs, fancy vegetables and fruit, but this hardly gives an active tone to business. It is projected that merchants engage the use of oxen from available points, in order to relieve the wharves and railroad depots from the crowded accumulation. It is likely that shipments will be discouraged until there is a change for the better in the stables, but for some time we shall have to submit to a very deranged market.

Receipts.—The receipts of the principal kinds of produce since our last are as follows:

Corn, bush	969,500	Meal, bbls	5,100
Oats, "	266,300	Flour, "	87,180
Wheat, "	575,000	Eggs, "	6,920
Rye, "	—	Cotton, bales	20,465
Barley, "	368,000	Hops, "	1,139
Malt, "	30,000	Wool "	818
Seed, "	488	Butter, pkgs	16,100
Beans, "	2,800	Cheese "	59,472
Meal, bags	420	Lard, "	2,490
Peanuts "	1,540	Dried fruits, pkgs	1,583
Pork, bbls	553	Cut Meats "	1,829

Beans and Peas.—Speculators have been in the market and bought up mediums freely, leaving light stocks in first hands, and, with small arrivals, prices are higher. The distributing demand is only moderate: marrowfats are plenty and offered freely at the quotations. Southern B. P. are lower and dull.

We quote Mediums, prime $2.15@2.50 per bushel; good do., $2.30@2.40; fair do., $2.00@2.25; prime marrowfats, $2.65@2.70; good do., $2.40@2.50; common and fair do., $2@2.25. Green peas at $1.80@1.90. Southern black-eyed peas, $2.80.

Butter.—The market was good enough before trade became paralyzed through the want of horses, and even with the present interruption prices for choice grades are very firm. For selections there is an active trade, as during this part of Autumn there is an important call for family supplies. Low grades of butter are dull and the range is wide between fair to prime State.

Orange Co. pails, fine, 38@40c.; Penn. and N. J. pails, good to fine, 26@35c.; common, 15@18c.; selections, half tubs, 35@36c.; half tubs in lots, 28@30c.; good to prime firkins, 27@29c.; do. Welsh, Fall, 27@28c.; Welsh tubs, fair, 20@23c.; other grades of State, 18@22c.; Western Reserve, choice, 21@23c.; Western fair to good, 13@15c.; common, 10@11c.; grease butter, 7½@8½c.; State dairies, 28@31c.

Cheese.—Trade wants are urgent, but the difficulty in moving, through the horse distemper, limits the business from this source. We are having larger arrivals, but they do not include more prime stock than needed. Receivers, in instances, obtain 15c. for choice lots, in a jobbing way, but 14½c. is the top figure from shippers. The market is stimulated by the confident feeling in the interior. The foreign reports are satisfactory, but trade from shippers at the moment is small, the exports for the week footing only 11,856 packages.

We quote State factory, choice, 11¾@15c.; good to prime, 13¾@14c.; fair, 12½@13¾c.; State dairy, 13@13¾ for good to prime, 12@13c. for fair lots; for Ohio factory, 13¾@13¾c. for good to prime; English dairy, prime, 13½@14c.; fair do., 11½@13c.

Cotton.—No further important changes are made in prices for forward delivery. There is a good export trade, but there is more stock to work upon.

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	16¼	16¾	16¾	17⅛
Good Ordinary	18⅜	19	19⅜	19⅜
Low Middling	19¼	19¾	19⅞	20
Middling	19⅞	20	20⅜	20½
Good Middling	20⅜	21	21⅛	21⅜

For forward delivery trade is moderate, with sales on the basis of low middling at 19¾c. for Oct., 18¾c. for Nov., 18 11-16c. for Dec., 19c. for Jan., 19⅜c. for Feb., 19⅞c. for March.

Dried Fruits.—A lot of 500 bbls low grade apples was taken for a German market, but outside of this there has been no business from shippers. The home trade are buying a little more freely, but they have low prices named. Peeled peaches are plenty and more in the buyer's favor. Blackberries are dull. Cherries are held firmly.

Southern apples, 3½@5c.; do. sliced, 7@9c. Peeled peaches at 11@12c. for Ga., 11@13c. for Va., and 17@21½c. for North Carolina. Unpeeled peaches at 5½c. for quarters, and 6c. for halves. Cherries, 23c. Plums, 14@19c. Blackberries, 9@9½c.

Flour.—Prices are 15@30c. lower, with slow sales and receipts accumulating.

Superfine State	$5 90	@	6 30
Common extra do	6 90	@	7 10
Good to choice do	7 05	@	7 15
Fancy do	7 20	@	7 65

Shipping brands round hoop Ohio	7 00	@	7 25
Trade brands do	7 30	@	9 60
Good to choice white wheat extras	7 90	@	8 25
Fair to very choice extra Minnesota	7 56	@	11 00
Common to fair extra St. Louis	7 25	@	8 50
Good to choice do	8 55	@	11 00
Extra Southern	7 45	@	9 75
Good to choice do	9 80	@	12 00
Rye, common to fine	4 35	@	5 35
Corn meal, Western	3 40	@	3 75

Fresh Fruits.—The demand is generally moderate from reasons shown above. Apples are turning out well and finest are firm. Duchess pears are higher, the stock of pears is very slim, cooking pears are higher. Quinces will not be a full crop and prices are strong. Grapes are easy and in full supply. Cranberries firm for choice, hard fruit.

We quote:—Apples, prime, $2.50@2.75; mixed, $2.12@2.37; fair, $1.50@1.75; common, $1. Pears.—Fine Duchess, Seckel, Louis Bonne, Virgalieu B. Diel, $12@15; rough lots do., $8@10; cooking, $1@7, which is better. Grapes.—Concords, 7@10c.; Isabella, 7@8c.; Catawba, @11. Cranberries, per crate, fine, $3.50@3.75; other, $2.75@3; bbls., $12@12.50 for Cape and $8@11 for N. J. Chestnuts, per bush., $3@3.50. Hickory nuts, $1.75@2.

Grain.—Prices of wheat are lower. There is a fair supply and very little business. We quote at $1.47@1.55 for No. 2 Spring afloat, $1.58@1.60 for No. 1 do., $1.57@1.65 for Winter red Western, $1.69@1.73 for amber do., and $1.70@2.03 for white do. Rye is dull at 85c. for Western. Barley is active and firm. Sales of Canada West at $1.15@1 16; Bay Quinte, $1.18. Corn is lower and quiet. Western mixed 63½@64c.; high mixed, 64½@65c. Oats sell slowly at 35c. for new Western mixed, 46½@48½c. for old do., and 41@43c. for black Western.

Hay and Straw.—The demand is moderate at the reduced prices. Supplies are fair. We quote new shipping hay at 95c.@$1.; retail do., $1.20@1.50; salt, do., 55@60c.; clover, 75@80c. Straw at $1@1.05 for long rye, 75@85c. for short rye; 70@75c. for oat.

Hops.—Growers have succeeded in forcing up bids, and dealers here feel warranted in advancing prices. The arrivals, although larger, are still insufficient, brewers taking them up about as fast as offered. We are not having foreign growths to any extent.

New York, growth 1872, at 30@35c.; Eastern do., 30@35c.; Western do., 30@35c.; Yearlings '71 20@25c.; Olds '70 10@15c.; Old Olds, '68-69 8@10c.; Bavarians, 30@35c.; English, 25@30c.

Poultry and Game—Prices are very much lower on poultry through the large supplies and the unfavorable weather for holding stocks. Game is selling well at full prices. A few lots of venison have been received. As the season advances we give more extended quotations.

We quote dressed poultry:—Chickens, Jersey and Bucks county, prime, 18@20c.; do. fair to good, 16@18c; do. State, prime, ₩ lb., 16c.; do. fair to good, 14@15c.; do. Western, prime, 15@16½; do. poor to good, 12@14c. Ducks, Jersey, prime, 21@22c.; do. fair to good, 17@18c.; do. State, prime, 20@21c; do. fair to good, 17@19c; Western, good to prime, 18@19c.; do. fair to good, 15@16c. Geese, Jersey, prime, 17@18c.; do. fair to good, 15@16c.; do. State, prime, 17c.; do. fair to good, 15@16c. Live Poultry:—Chickens, Jersey, ₩ lb., 14@15c.; do. Western, 13@14c.; roosters, 9c. Turkeys, Jersey, 16@17c.; do. Western, 15c. Ducks, Jersey, ₩ pair, 75c.@$1; do. Western, 62½@75c. Geese, Jersey, young, ₩ pair, $1.25@2.50; do. Western, $1.75@2. Game: Quail, ₩ doz., $4.75; grouse, ₩ pair, 50c.; partridges, State, $1 20; do. Eastern, 75c; woodchuck, 50@75c.; pigeons, stall-fed, per doz., $2.50@3; hares, ₩ pair, 60@75c.; mallard ducks, 50@60c.; teal, 40@45c. Venison, 25@30c. for short saddles; 17@18c. for whole deer.

Provisions.—There has been another excited period in pork, and prices for mess have advanced to $15.80 for Oct., and $15.30 for Nov. Eastern prime, fresh inspected, $12.50. No public quotations for beef are yet arranged. Old quoted as before, though not firm. We quote $5@8 for plain mess in bbls., $8@10 for extra do; 50s., $12@16 for prime mess, and $17@20 for India. Bacon is easier for best; long clear quoted at 9c., and short clear, for Winter months, 8c. Weather-cured beef hams, $23. Cutmeats are easier, as the local trade is interfered with by the horse troubles. Smoked hams, 15½@17c.; do. shoulders, 7½@8½c.; pickled shoulders, 7c.; do. hams, 13½@14½c.; clear ribs, 7c.; pickled bellies, boxed, 8½c.; dry salted hams, 7c. Lard firm and active at 8½@8¾c. for Western. New lard has sold to arrive at 8½c. City steady at 8½c.

Seeds.—Sales are of small lots. Timothy is selling at $4.75. Clover at 9½c. for Ohio, 10½c. for Indiana and Michigan, and 10½c. for State. Rough flax is dull, quoted at $1.55.

Sundries.—Honey is now selling, upon arrival, at better prices. Small lots of honey quoted at 28@30c. for dark and 32@35c. for light, in glass boxes; mixed lots, 21c. Cider at 6@10c. per gallon. Feathers, live geese, new, fine, per lb., 60@70c.; do. mixed, 40@50c.; hen, 70@90; vinegar, cider, ₩ gal., 20@25c.; do. manufactured, 15@20c.; newspapers, ₩ lb. 1@1½c.; white rags, 5@5½c.

Tobacco.—Kentucky leaf is active at full prices. Seed leaf is moderately active. There has been a large business in foreign fillers:

QUOTATIONS—NEW CROP.

	Light Grades.	Heavy Grades.
Lugs	8½@ 9½c.	9½@10½c.
Common to medium leaf	10 @10½c.	10½@11½c.
Good do.	11 @11½c.	11½@12½c.
Fine do.	11½@12½c.	13 @14 c.
Selections	13 @14 c.	15 @16 c.

NEW CROP.

Connecticut and Massachusetts fillers	11	@16 c.
seconds	26	@35 c.
wrappers	40	@55 c.
selections	50	@75 c.
New York State running lots	12	@16 c.
Pennsylvania assorted lots	18	@25 c.
Ohio running lots	12	@16 c.
Ohio wrappers	16	@30 c.
Wisconsin and Western	9	@10 c.

Vegetables.—Prices of potatoes are higher with lighter supplies. The West will have very little competition this fall, as scarcely any stock is expected from near points.

Early Rose, bbl., $1.87½@2.50; Jackson White, $1.75@2.00. Peach Blows, $2.25@2.75. Tomatoes, 75c. Squash, per bbl., $1@1.50 white and yellow. Cabbages, $8@10. Onions, red, ₩ bbl., $2.75@3.00; yellow, $3.25@3.50. Sweet potatoes, $2.50@3. Pumpkins, $7@8. Garlic, per 100 bunches, $16@18. Russia turnips, ₩ bbl., $2.50@3.

Whisky—Is quoted at 93c. for Western.

Wool.—The market is very firm, in sympathy with the tone at other points. An advance in Philadelphia is reported, and holders here expect some improvement in prices. Stocks receive very light additions. We quote fleece at 52@57c. for New York and Michigan; 51@61c. for Ohio; 52@57c. for Indiana and Wisconsin; 49@55c. for Illinois; 50@55c. for Texas, fine; 30@35c. for do. coarse. Pulled, 50@60c. for extra.

COUNTRY CHEESE MARKETS.

Little Falls, N. Y., Oct. 26, 1872.

THE market at Little Falls for the week ending Oct. 26th was rather dull, but prices firm. In farm dairies the shipments by railroad and canal amounted to 850 boxes, and sales were made at 13@14c.—the bulk of sales being at about 13½c. The offerings of factories were estimated to be upward of 10,000 boxes, 6,000 of which were sold. We give the leading transactions as follows:

Avery & Ives	14½	Hill	14½
Bethel	14½	J. D. Ives	14½
Brockett's Bridge	14	Old Stone Church	14

Butter has sold this week at 28@29c.

The weather is warm and pleasant. Afterfeed continues abundant in Herkimer, and is not materially injured by frosts, which, so far, have been very slight.

LIVE STOCK MARKETS.

NEW YORK, Oct. 26, 1872.

NEARLY every influence calculated to affect the trade in live stock has been adverse during the week under review. The weather for the greater part of the week has been unfavorable; to avoid the increased cost of transportion under the advanced freight tariff to take effect on and after Monday last, shippers pushed forward the stock already purchased and forced it into market on irregular market days, regardless of the wants of our butchers; and to these depressing influences was added the "equine epidemic," threatening to temporarily suspend all business in the city dependent upon horse-power. The result is a marked decline in the market value of every description of butchers' stock, except veal calves, and these have been so scarce that butchers have taken them at former prices.

RECEIPTS OF LIVE STOCK.

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.
Totals this week	9,550	58	2,240	26,350	44,080
" last week	10,226	71	2,418	29,816	43,010
Average last year	7,187	88	2,301	25,132	25,177

Beeves.—Compared with the previous week the total is 676 less, but greater, by 2,363, than the average per week last year. There were fewer Texans offered, and the quality was averagely better than for several of the previous weeks. The market was inactive and weak on each and every market day, and the sales pens were at no time free from stale stock. The demand was mainly for ripe native steers of good weight, and for fat Texans. Some of the Texans offered were counted the best ever shown here, and an eighth car load lot was sold at 11½c. to dress 57 lbs. to the gross cwt.—the highest figure received for a drove of Texans this year. Another drove of Texas heifers brought 7¾c. to dress 55 lbs. to the gross cwt. The native cattle differed widely in respect to quality, and the range of prices was also very wide. A car load of little Ohio heifers sold at $25 per head, or about 6¾c. to dress 51 lbs. to the gross cwt., represents the lowest quotation, and four car loads of extra Illinois steers, 8¾ cwt. average, and sold on Monday to shop butchers at 14½c. to dress 60 lbs. to the gross cwt., give the highest figure of the week. At the close, the range for natives is 6¾@13¾c., and for Texans, 7@10c.

The following are the closing prices for the week in comparison with what cattle brought one week ago, for net weight of beef:

	This week. Cents.	Last week. Cents.
Choice beeves, ₩ lb	13 @ 13¾	13¾ @ 14
Good to prime	11¾ @ 12¾	12 @ 13
Medium	10 @ 10¾	10¾ @ 11
Poorest grade	6¾ @ 9	7 @ 9¾
Average sales	10¾ @ —	11 @ —

Milch Cows.—With only 58 fresh cows on sale during the week, prices remain the same. The quotable sales have ranged from $35 to $85 for poor to extra; but one fancy cow and calf sold for $110 and another for $95.

Calves.—Milk-fed have been unusually scarce even for October, and good Bucks county and near by State and Jersey veals have been readily sold at 10@11c. ₩ lb., some of the best going to 11¾@12c., while course, heavy calves, partly meal-fed, have ranged from 7@9c. and grassers from $5@10 per head in large lots.

Sheep and Lambs.—The week just closing will long be remembered by both sheep drovers and butchers as one of the most discouraging market weeks ever known by them. Mutton has been dull all the week, and every car load sold in Washington market entailed a heavy loss to the slaughterer. The highest prices that the butchers could be induced to offer came far short of covering the cost of the stock to the drover. Sellers who held their offerings from day to day in hopes of a favorable turn in the tide, were finally forced to accept much lower prices than had been refused; and thus the market has dragged along, growing worse daily and closing weak at 6@8c. ₩ lb. for poor to prime lambs, and 4¾@6¾c. for common to prime sheep—a decline for the week of ¾c. per pound.

Hogs.—The market for hogs has been no exception to the rule of lower prices. The supply has been heavy, and with the uncertainty of being able to get the slaughtered hogs to the cutters, trade has been embarrassed and the market closes weak at 4¾@5¾, ₩ lb., for live hogs and 6@6¾c. for dressed.

LATEST.—Monday, October 28, 4 P. M.—Beeves.—Fresh receipts, 275 cars, or 1,151 head, making 8,201 for the week, against 9,550 last week. Market dull, with little or no change in prices. A few fancy native steers were sold at 13¾@14c. ₩ lb.; but 9@13c. is the actual range for native steers, and 7½@9¾c. for Texans.

Sheep and Lambs.—Receipts number 6,959 today, and 27,152 for the week. Sales were slow and transactions limited at 4¾@6¾c. ₩ lb. for sheep, and 6@8¾c. for lambs.

Hogs.—Fresh arrivals number 13,537, making 59,176 for the week. Market weak and unsettled at 4¾@5c. ₩ lb. for live hogs, and 6@7c. for dressed.

SPECIAL NOTICES.

RUPTURE CAN BE CURED

without suffering. ELASTIC TRUSSES are superseding all others. Before buying Metal Trusses or Supporters, send for a descriptive circular to the ELASTIC TRUSS CO., No. 683 Broadway, New York.

FASHIONS FOR WINTER.

1170

1170—GODIVA. This Polonaise is one of our latest Paris novelties. It can be worn plaited, gathering baspine, or looped (as shown in cut), like a moderate bustle. The ornamental back piece falling over the shoulder, and forming a neat bow, is quite fresh, and is adjustable, may be worn or not as fancy dictates, thus rendering it favorably different Polonaises appearance. The back piece is sometimes made in velvet or satin, and richly trimmed and completes a brilliant toilet when worn with a house dress. Besides its beautiful variations, it is well adapted to any material. Take six yards of twenty-four-inch goods. Price of pattern, with cloth model, ONE DOLLAR. See GRAND PREMIUM below.

1133

1133—DOLMA CLOAK. Needs no lengthy description to win universal favor. For comfort, neatness, and elegance combined, it is equal to not to be found among the novelties of this winter's productions. Take two and a half yards double-fold ladies' cloth, pattern, with cloth model, 60 cents.

931—LA PIERRE OVERSKIRT. The most attractive and elegant style for making, in all kinds of material. And though for a season Polonaises have reigned, yet a spirit of *change* is quite evident, and we gladly accept this beautiful novelty which will gratify the wishes of thousands who desired to see overskirts again in high favor. Takes three yards thirty inch goods. Pattern, with cloth model, 50 cents.

The above engravings are taken from the BEST Fashion Magazine IN THE WORLD! It is the New York City Ladies' AUTHORITY in all matters of STYLE and Dressmaking, and the ONLY publication in this country that IMPORTS Fashions and SELLS paper patterns of them. It gives full information upon every point in Style, besides minute instructions in making all kinds of garments.

This number contains a large fashion plate 11 by 22 inches, STORIES, HINTS, Criticisms, Foreign News, &c.

Smith's Illustrated Pattern Bazaar,

Only ONE DOLLAR A YEAR!!!

GRAND PREMIUM, By sending ONE DOLLAR and TWO STAMPS with your name and address to A. BURDETTESMITH, 914 Broadway, N.Y. you will be made a *yearly subscriber* to SMITH'S ILLUSTRATED PATTERN BAZAAR, AND the pattern with CLOTH MODELS, complete, of the THREE above engravings will be mailed to you, FREE, AS PREMIUM.

Either of the above patterns sent by mail on receipt of its marked price.

A CATALOGUE

of Winter Styles, selected from the Bazaar. Worth more than any Fashion Magazine to show what is now worn. Mailed to any address on receipt of Two Stamps.

We give a CLOTH MODEL with each pattern, which SHOWS every seam, pleat, gather, loop, etc., how to put the garment together by the pattern, and how it will look when completed. By the aid of our Cloth Models any person who can sew can FINISH the most difficult garment as easily as the plainest. They are PERFECT GUIDES.

Address, very plainly,

A. BURDETTE SMITH,

New Publications.

THE PRAIRIE FARMER
FOR 1872-'73!

The Prairie Farmer, now almost entering upon the thirty-third year of its usefulness, is the most popular and pre-eminently the best Western farm and fireside journal. It is original, reliable and comprehensive, each number presenting a rich variety of instructive and entertaining matter. Issued weekly, its contents are always fresh and sensonable, and notwithstanding its present high standard of excellence, the publishers are warranted in promising that it shall be a better paper next year than ever before. Though designed especially to meet the wants of Western, Northwestern and Southern farmers and industrial men, and their families, it is also just what is needed by the thousands of people at the East who contemplate "going West," and hence wish to know all about Western farming, fruit-growing, tree-planting, cost of land, improved and unimproved, character of soil and climate, mode of cultivation, average yield, &c., &c.

Now is the Time to Subscribe!

Because for the purpose of introducing THE PRAIRIE FARMER into households where it is not now taken we make the following liberal offer, made by no other Weekly Journal in the country, viz.:—To every new subscriber to THE PRAIRIE FARMER, for the year 1873, whose name, accompanied by TWO DOLLARS, is received after this date and prior to January next, we will send the paper the remainder of 1872, gratis. That is, subscriptions will date from the time received, and expire January 1st, 1874! Therefore, if you subscribe now you will receive THE FARMER fourteen months at the regular price for a year, and the sooner you subscribe the more you will get for your money!

Now is the Time to Get Subscribers!

Because you can reap the benefit of the foregoing offer of the rest of the year free to new subscribers for 1873, by presenting it as an inducement, and thereby be enabled to secure a larger club in less than half the time than if you waited until the close of the year. Besides, "the early bird catches the worm," and if you go to work now you will have a comparatively clear field and readily secure many subscriptions which a few weeks later will, perhaps, have been given to some other journal. Therefore, we call upon all our old Agents and friends everywhere, as well as new ones, to begin the canvass immediately and in earnest, and let us have a lively, vigorous and successful campaign.

You Don't Work for Nothing!

Remember that our New Premium List, now ready, embraces One Hundred Attractive and Useful Articles, offered on most desirable terms, and also that Agents who prefer it, may retain, in remitting, a Cash Commission of Twenty per Cent. Sample copies of the paper, and other canvassing documents, are ready and furnished free on application. Send for them and go to work. Address

THE PRAIRIE FARMER COMPANY, Chicago.

THE KENTUCKY

Library Gift Concert.

$500,000 in Bank to Pay all Gifts.

A FULL DRAWING IN SIGHT.

$100,000 FOR ONLY $10!

At the Second Grand Gift Concert, authorized by special act of the Legislature, in aid of the Public Library of Kentucky, unavoidably postponed from September 25 to December 7, and which positively and unequivocally occurs in Louisville, Ky., **SATURDAY, December 7, 1872,** without further delay on any account whatever, the following Cash Gifts are for distribution by lot among the ticket holders:

One Grand Gift, Cash			**$100,000**
One Grand Gift, Cash			**50,000**
1 Cash Gift	$25,000	4 Cash Gifts	$4,000 each
1 Cash Gift	20,000	15 Cash Gifts	1,000 each
1 Cash Gift	15,000	20 Cash Gifts	500 each
1 Cash Gift	10,000	21 Cash Gifts	300 each
1 Cash Gift	9,000	25 Cash Gifts	200 each
1 Cash Gift	8,000	35 Cash Gifts	200 each
1 Cash Gift	7,000	45 Cash Gifts	500 each
1 Cash Gift	6,000	50 Cash Gifts	400 each
1 Cash Gift	5,000	63 Cash Gifts	300 each
1 Cash Gift	4,000	104 Cash Gifts	200 each
1 Cash Gift	3,000	672 Cash Gifts	100 each
Total, 1,000 Gifts, all Cash			**$500,000**

The money to pay all these gifts is now upon deposit, and set apart for that purpose, in the Farmers' and Drovers' Bank, as will be seen by the following certificate of the Cashier:

FARMERS' AND DROVERS' BANK,
LOUISVILLE, KY., Sept. 26, 1872.

This is to certify that there is now on deposit in this bank over half a million of dollars to the credit of the Gift Concert Fund, $500,000 of which is held by this bank as Treasurer of the Public Library of Kentucky to pay off all gifts to be awarded at the drawing.

R. S. VEECH, Cashier.

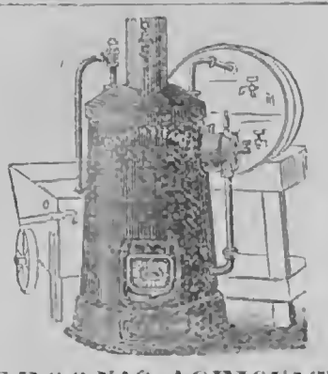
PRICE OF TICKETS.

Whole tickets, $10; halves, $5; quarters, $2.50; 11 whole tickets for $100; 24 for $200; 26 for $500; 113 for $1,000; 285 for $2,500; 555 for $5,000. No discount on less than $100 worth of tickets at a time.

The drawing will positively and unequivocally take place December 7. Agents are peremptorily required to close sales and make returns November 25, in order to give ample time for the final arrangements. Orders for tickets or applications for circulars should be addressed to **Gov. THOS. E. BRAMLETTE,**
Agent Public Library of Kentucky,
Louisville, Ky.

N. Y. Office, **609 Broadway,** in charge of **Major Thomas H. Hays.**

Implements and Machinery.



ANDERSON'S AGRICULTURAL STEAMER, for *Steaming* FEED FOR STOCK, Heating Cheese Vats, Tannery Vats, Conservatories, &c. This Steamer is made of Wrought Iron, thoroughly riveted and finished in good style. It has a reliable Automatic or Self-regulating Water Feeder, Safety Valve, Vacuum Valve, Water Gauge Cocks, Whistle, &c., all complete. The boiler is peculiar in construction, being ONE COMPLETE DOUBLE BOILER WITHIN ANOTHER, the two communicating one with the other. It has an extraordinary amount of fire space for the size of the boiler—No. 3, a medium size, having 3,833 square inches of fire surface; consequently, it requires but little fuel to run it. Either wood or coal may be used for fuel.

It will cook more feed, or heat more water, in a given time, than any other Steamer of the same size or cost. It is more durable than any other, for the reason that the fire-box is made of wrought iron, and is *entirely surrounded with water.* We are also manufacturing

Anderson's Low Pressure Steam Heater,

for Heating *Private Dwellings, Stores, Churches, Conservatories, &c.* We manufacture for all the territory east of Illinois.

THE HIGHT OF COMMERCIAL MORALITY.

"Oh, I want to buy another of those pretty Teapots, like the one I bought last week, you know!"

"Shure, an' we've given up keepin' them intirely, my lady! For as soon as iver we got them in we sold them out!"

BANKING HOUSE OF
FISK & HATCH,
No. 5 Nassau Street, New York.

DEPOSITS received, on which we allow interest at the rate of four per cent. per annum. Special arrangements made with Savings Banks and others depositing large amounts.

We issue CERTIFICATES OF DEPOSIT, available in all parts of the country, and bearing interest in case of special deposit.

We make COLLECTIONS for merchants and others in all parts of the country.

Orders for INVESTMENT STOCKS and BONDS executed at the Stock Exchange, on commission, for cash.

We deal in GOVERNMENT BONDS, and in the following FIRST-CLASS RAILROAD SECURITIES, which we can recommend with confidence, from a thorough knowledge of their character and value, viz.:

CHESAPEAKE AND OHIO BONDS, six per cent., gold. Denominations $100, $500 and $1,000. Interest May and November.

CENTRAL PACIFIC BONDS, six per cent., gold. Denomination $1,000 each. Interest January and July.

WESTERN PACIFIC BONDS, six per cent. gold. Denomination $1,000 each. Interest January and July.

Owing to the present high rate of interest, and consequent dullness in American Securities in Europe, and the demand for money here to move the crops, the present is a favorable time to make investments in these favorite Securities, as they can just now, for the above reasons, be purchased at less than their usual market prices, and a considerable advance is reasonably certain.

Full information furnished upon application at our office, in person or by mail.

FISK & HATCH.

TARRANT'S SELTZER APERIENT

The Enemy Surrenders.

The dragon slain by St. George, and the snake that stopped the march of Regulus, were mild nuisances compared with CHRONIC INDIGESTION and its accompaniments; yet this foe of health and life, with all the brood of bilious and nervous ailments of which it is the parent, surrenders to

TARRANT'S EFFERVESCENT SELTZER APERIENT,

and is banished from the system. At this season, when the physical powers are so apt to droop and languish, and the spirit to give way, the toning, purifying, refreshing, renovating and regulating operation of this most agreeable of all correctives is especially conducive to a healthful and vigorous condition of the system. Sold by all Druggists.

Rural Architecture.

FARM DAIRY HOUSE.

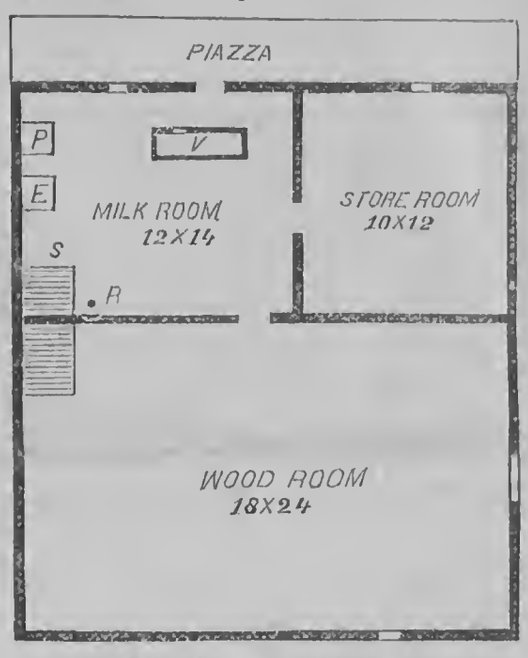
The following description, with elevation and plan, of a Farm Dairy House, is from "Willard's Practical Dairy Husbandry," a work which every dairyman, or every man who intends to engage in the manufacture of milk, should buy and consult, for it is the only standard and complete work on this branch of husbandry yet published:

The question is often asked whether under our factory system a dairy house is required on the farm. I should advise such a structure, though it need not be so expensive and elaborate as is sometimes seen under the old system of family dairying. The building should be arranged and fitted up for both butter and cheese manufacture. The reason for the erection of such a structure even in cases where the milk is to be carried to a factory will, from a moment's reflection, be obvious.

In the first place, the factories open and close operations at stated periods, and during the time they are not working considerable quantities of milk must be cared for and utilized at the farm. With no provision for the care and manufacture of such milk the annual loss from waste will soon amount to more than the cost of building and fixtures, to say nothing of the worry and trouble in trying to utilize the milk without any conveniences.

Again, occasions occur when it is desirable to make up the milk on the farm to secure the butter or cheese for family use. Possibly, from time to time some accident may happen which would exclude a batch of milk from the factory, and in such cases it may often be worked up on the farm without material loss. Cases not unfrequently occur where a factory is badly managed, where the cheese or butter maker is incompetent, and while such a condition of things remains, or during the time it may take to make a change of manufacturers, it will be desirable to hold the milk at the farm. There are a variety of circumstances constantly occurring in neighborhoods where factories exist which make the necessity for a dairy house imperative, if the dairymen would avoid losses, and I therefore think it economy to provide such structures, and I hold that they belong to good dairy management.

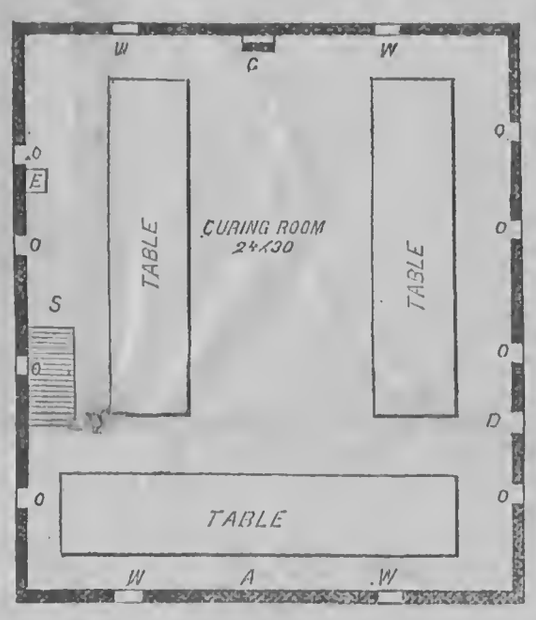
What is a Proper Dairy House, and how should it be located? For convenience it should be situated near the milking stables, but out of the way of odors and gases arising from the decomposition of manures, since milk absorbs these with great facility, resulting in injury to the product. Where side-hills are convenient to the other buildings, they afford advantageous situations for placing the dairy house. In such cases the lower story of the house, if built of stone, will help to secure a low and even temperature for the milk-room. A building twenty-five feet by thirty feet, a story and a-half high, would be ample for a dairy of forty cows. The lower part should be divided into two departments, one for butter manufacture and the other for cheese. The two departments should be arranged so as to afford easy communication, the one with the other. If



BASEMENT, OR FIRST FLOOR.

Cold Spring Water can be be conducted into the house, the butter department should be arranged with water tanks sunk into the earth to hold water twenty inches deep. The tanks may be made of wood, but are better if of stone, well cemented. Pipes leading from the tank or tanks through the wall on the lower side of the building will conduct off surplus water. These tanks are for holding the cans of milk for obtaining cream. There should also be

A Small Butter Cellar connected with this department, by partitioning off a part of the room next the bank or hillside. The milk-room should have windows at the upper part, or near the ceiling, protected with wire gauze, so as to be used for ventilation.



SECOND FLOOR.

The floor of

The Cheese Making Room may be a step higher than the butter-room, and should be provided with self-heating vat for cheese making, press, hoops, and curd knife. The story above should be in one room, and is to be employed for curing cheese. There should be a large ventilator in the center, rising above the roof of the building and extending through the ceiling of the curing-room, provided with a wicket by which the draft may be regulated or shut off as desired. About the sides of the room, and even with the floor, there should be openings nine inches by twelve, arranged with wickets, so that air may be admitted in large or small quantities, or closed off, as needed. With the small ventilators at the sides and the large ventilator in the center

The Curing-Room may be kept free from impurities and noxious gases, while the temperature to some extent may be controlled in warm weather. The curing-room should be well lighted, as light operates beneficially in securing a fine flavor to the cheese.

When the dairy house is to be located on a level surface, and stone is expensive or not convenient, the building may be wholly of wood, the bottom room having double walls, and if possible should be shaded by trees. Instead of tanks set in the ground the room may be provided with the

Jenningsʼ Pans.—The pans consist of large shallow tin vats, set in wooden vats, with spaces between for water. The pans are of various sizes and one pan is designed to hold the entire mess of milk of the dairy at one milking. The water may be conveyed to the pans either by pipes leading from the penstock, or it may be drawn from the well. I have not proposed here to enter into minute descriptions of dairy house and apparatus, as these more properly belong to to the topics in which butter and cheese manufacture are considered. But I have given some of the leading features required in the construction of these establishments, from which a general idea may be had.

Description and Plan of a Farm Dairy House.—In the plan of farm dairy house presented, economy, simplicity and convenience have been studied, together with the means of regulating temperature in the cheese-curing room to some extent by the use of wickets and ventilators. The design is for farms where cheese dairying is conducted as a specialty and where from twenty-five to thirty-five cows are kept.

A building twenty-four feet by thirty feet, story and a-half high, will be large enough for an ordinary sized dairy—say of the number of cows above named. Light is to be admitted only on the north and south sides, as less liable to let rays of the sun fall on the cheese. The lower part is divided into rooms for making cheese, twelve by fourteen feet; store-room, ten by twelve feet; the balance, wood house, eighteen by twenty-four feet. If desired, a portion of this latter room may be partitioned off, or nearly the whole of it con-

CHEESE DAIRY HOUSE ELEVATION.

verted into a place for setting milk for butter during Spring and Fall. A piazza runs along the sides of the store room and room for making cheese, rendering these parts cooler in Summer, and affording a convenient place for drying and sunning utensils. The upper part of building, the cheese-curing room, twenty-four by thirty feet, eight feet high, studded, and lathed and plastered.

A ventilator runs from ceiling in center of room above the roof, terminating in usual form with arrangements at ceiling for closing draft entirely, or conducting larger or smaller quantities of air as desired. Air is admitted under the roof (where it joins the sides of the building) into the garret, so that by opening slides inside the ventilator above the ceiling, a current of air may be maintained in the garret part. Openings, with wickets, are placed at the bottom of the room, and along and through the sides of the building, to the open air—three or more on a side. These openings are ten by twenty inches; the wickets close tight or admit more or less air as desired at pleasure. An ice reservoir or refrigerator on rollers can be set in the room in which ice may be exposed if necessary, in extremely hot weather. A good coal stove, tables with *hemlock* bed-piece, for holding the cheese, thermometer and platform scales. These are the general features of the dairy house suggested. The whole will be readily understood by the cuts:—O, O, openings with wickets; C, chimney; E, elevator; D, door for delivering cheese; A, alleys; W, windows; V, vat and heater for making cheese; P, cheese press; E, elevator for elevating cheese; S, stairs; P, cistern pump.

Hygienic Information.

INFLUENCE OF MARRIAGE UPON HEALTH.

M. BERTILLON, lately having had to draw up a paper for the Academy of Medicine of Paris on the influence of marriage on mortality, consulted the registers of the only three countries in Europe which were carefully enough kept to give him a reply to his question—those of France, Belgium, and Holland. He shows that if the male sex be first considered, we find that, from 25 to 30, 1,000 married men furnish 6 deaths; 1,000 unmarried, 10 deaths; and 1,000 widowers, 22 deaths. From 30 to 35, of 1,000 married men, 7 die; of 1,000 unmarried men, 11½ die; and of 1,000 widowers, 19 die. From 35 to 40, of 1,000 married men, 7½ die; of 1,000 bachelors, 13 die; and of 1,000 widowers, 47½ die; and so on at all the following ages, married men continuing to live with greater facility than the bachelor. It has been said that since only the most fortunate men can afford to marry, it is not astonishing that these persons should live longer. But this will not, of course, account for the very great mortality of widowers at all ages, which, indeed, surpasses that even of bachelors.

However, it must be noticed that 8,000 young men marry in France yearly, under the age of 20. This is very fatal to such young men, for M. BERTILLON finds that, whilst 1,000 young men from 15 to 20 furnish 7 deaths, when unmarried, no less than fifty deaths occur among 1,000 young married men under 20. Women seem to reap less advantage from marriage than men, and there is but little difference in the mortality of unmarried and married women before the age of 25. It is but little marked even between 25 and 30.

HOW TO CURE A COUGH.

LAST Spring I dressed myself to correspond with the weather, and taking my dinner with my husband and several of the hands, started for the farm. A part of my work was to help lay off the ground for house, yard, garden and orchard, and then we commenced the work. I assisted husband in setting fruit trees of all kinds and shrubbery in abundance; then assisted in the garden as long as was necessary; and while at such work I found it was just what I had ought to have been doing for years back; for I have had a severe cough from infancy, coughing almost day and night; but after working a few days out of doors I stopped coughing at night; then I coughed very little through the day. My general health has been so much improved by it, that I feel like telling others to try it, and I feel so *proud* of it I want to tell every one of my friends that I have found a remedy for my cough. I think the RURAL NEW-YORKER will take to have a part of the credit. MRS. E. VERMILYA.

Davis Co., Iowa.

Land Department.

THE SHENANDOAH VALLEY.

SEEING W. H. C.'s inquiry in the RURAL of Oct. 12, relative to the Shenandoah Valley of Virginia, I concluded (having been there for many years) to give such general information as I possess upon the subject, at the same time advising all interested in this section to pay it a visit and judge for themselves. I would add that I have no ax to grind, nor any land for sale in that section. The Virginias have within themselves the elements of an empire. No country possesses superior advantages for agricultural pursuits. No States in the Union are more varied in their productions; none richer in natural resources; none more abundantly supplied with the readiest and best channels of communication; none affording greater facilities for manufacturing operations of every sort, and none, it may be said, which exhibit over their broad surface such pleasant variety of the wildest and most lovely scenery. And yet in agricultural, and every species of industrial enterprise, and in that advancement and prosperity which characterize our nation, the Virginias have been, and still are, far in the rear of the Eastern and Western States, which are greatly inferior to them in natural advantages.

The causes of this comparative stagnation are happily removed, and the two Virginias, mother and daughter, under wise and permanent governments, are now prepared, no less by their civil and social than by their physical condition, for the activities and energies of a population educated under a less genial climate and upon harder and scantier resources, which they now invite from abroad.

These States have fortunately enjoyed managing their own affairs by their own people in the work of reconstruction, and under a wise and conservative administration of their own affairs, they are far in advance of any of the Southern States, especially in the securities and blessings of stable, just and economical governments. Thus of the Virginias in general. Now of the Shenandoah Valley in particular.

This valley extends from the Tennessee line on the south to the Potomac River on the north. The same valley, under the local name of Cumberland Valley, Lancaster Valley, Lebanon Valley, and Lehigh Valley, extends through Western Maryland and Central Pennsylvania. It lies between the Blue Ridge and the North Mountains, the latter one of the Alleghany range, comprising the following counties—viz.: Berks, Lebanon, Lancaster, York, Dauphin, Cumberland and Franklin, Penn.; Washington, Md.; Berkeley and Jefferson, West Va., and Frederick, Clark, Shenandoah, Page, Rockingham, Augusta, Highland, Rockbridge, Bath, Botetourt, Allegheny, and Roanoke, Va. This comprises the "Great Valley," for such it most emphatically is.

There is no such valley in the known world, lying, as it does, between two mountain ranges, with the climate so healthy and salubrious, with soil so rich and diversified, producing all kinds of cereals, vegetables, and fruits; with springs and living streams of the clearest and best water everywhere; timber and stone, for fencing and building, enough to last for ages to come, and mineral wealth surpassing everything that has yet been discovered.

There is, probably, ten times the amount of limestone land in this valley, through Virginia and West Virginia, than there is in the same valley through Pennsylvania.

A railroad through the entire valley is completed, and a second one is under construction from Harrisburg, Penn., to the Tennessee line, with a number of railroads crossing the valley, or running out of it to the different Atlantic markets; so that every portion of this valley has an outlet to near and good markets.

The price of land in the Southern or Virginia and W. Virginia portion of the Great Valley (improved farms) is from $20 to $60, and in the Pennsylvania section from $75 to $400 per acre.

The land in the latter portion of the valley is in a much higher state of cultivation, and has, generally, better improvements. Yet the Shenandoah portion possesses many natural advantages over the other sections of the Great Valley. The great difference in the price of lands in the same valley is apparently unaccountable; yet, when the blight of slavery is understood, the cause of such great disparity is plain enough.

The labor is gone; the owners impoverished by the war; many cannot and will not work, at least as it should be done. Land there is not as high as any of the improved portions of the West, while the improvements are just as good, and good markets much more convenient. There is every reason to believe that the price of land in the Valley of Virginia will advance much faster in the next ten years than in any portion of the West and South; and even if it should not, there can be no finer and more desirable farms obtained anywhere than can be made in that valley by the expenditure of a little money for improvements, and the right kind of farming for a few years—farms that would compare favorably with the best in any section of the United States. PENNSYLVANIAN.

Field Crops.

COTTON IN CALIFORNIA.

THE Pacific Rural Press of a recent date has the following:—We have received from W. G. ALLEN, Jr., Bakersfield, three samples of cotton, the growth of the present year. There are three distinct varieties, the Dixon, the Texan and the Golden Prolific. There is nothing more needed to establish the fact that we are a cotton-growing people; and because we are, and with a climate proven to be second to none for cotton production, we are from this time on to be made rich by the extension of this one industry.

This remark of course applies to those particular sections of the State where soil and climate, or immunity from frosts, permit its culture. The growing of cotton is an industry that employs a large number of hands in the preparation of the ground, the sowing of the seed, the culture of the crop, to the final picking of the cotton from the bursting bolls; is a business full of industry, and yet comparatively light and unlaborious.

It is a crop that comes in admirably along with the culture of hops, both as regards the hand culture and the final picking, the hop crop being entirely secured just immediately before the cotton picking begins; so that the hands required for the former need not be discharged before commencing on the latter. And though a large number are required where the crop is large, there is a satisfaction in knowing that the crop will surely pay.

CAUSE OF POTATO DISEASE.

IN RURAL NEW-YORKER of Oct. 12, on page 234, I notice an item from Dr. KUHN on "Potato Disease." I have been watching the potato disease with interest for years. I am satisfied that the potato rot in this locality is caused by a small white insect eating through the skin of the potato during the growing season; it is too small to be seen by the naked eye, I have noticed when the rot is worst the potatoes are covered with little white specks; applying the microscope to these, they looked as if they were cut and chewed potato and pushed out in order to make an entrance for the little intruder. I took my knife and gently pared the skin away, watching all the time with the glass; my expectations were realized. I saw a small grub come out backward; with my knife I moved him on a piece of glass which I had ready, to examine him; he never ceased kicking and flouncing till he died. I repeated it several times with the same result, concluding that the light caused almost instant death. H. K.

Quaker City, Ohio.

FIELD NOTES AND QUERIES.

Potatoes Diseased.—It would be both interesting and profitable if your correspondents who grow potatoes would give their experience with varieties the past season, both as to comparative yield and healthfulness. Notes giving a list of those most diseased—if any are—would be of great use to those who desire to plant largely next season. Let those who write, state the kind of soil in which crops were grown and what kind of manure was used. —SAMUEL J. RICHARDS.

Castor Beans in California have not proved remunerative—even where a fine quality of oil was manufactured from them—and farmers who entered largely into its culture the past season are going to abandon it henceforth.

The Sportsman.

SHAD FISHING WITH HOOK.

WE have received the following letters from Mr. SETH GREEN, the well-known fish propagator and fisherman, which will prove interesting to all who love sport. They tell the story without further explanation:

FRIEND MOORE:—Inclosed please find a copy of a letter from Mr. VAN WYKE of New Hamburgh. It is something new on shad. Shad were caught in June last year and year before in the Connecticut River at Holyoke Dam, with a fly. I never heard of any being caught with any other bait. The letter explains itself. The shad he sent me weighed two pounds and a-half, and the young shad he sent me, hatched last Spring, are about four months old and 2½ inches long. I took twelve young shad out of the stomach of one of the old shad and eight out of the other. They were both males, two years old. I do not think the females came in the river at the above age.

In the year 1827 HENRY WILLIS of Battle Creek witnessed a haul of shad made with a seine owned by THOMAS STUMP, at Havre de Grace, Md., of so many shad that it took three days to get them out of the net. Mr. WILLIS bought 5,000 of the largest shad for $3 per hundred. Now they cannot take enough on the same ground to pay for fishing. Shad can be made as plenty in three or four years as they were in 1827.

SETH GREEN.

Rochester, N. Y., Oct. 21.

Mr. SETH GREEN:—Here I am again! This time on the shad question. I send you by express two shad caught by me to-day with rod and reel. I send them so that you can see them and eat them, to satisfy yourself that they are genuine shad. I also send you some little shad taken out of some shad caught by me. These little shad are what the larger shad (same size as I send you, and the bass we catch) feed on. I have heard for some time past that these shad were being caught on the reef at New Hamburgh where we have been catching bass; so to-day two of my brothers and myself went for them, and we caught fifteen. Baited with live bait—a small shiner. Never had such sport in my life. We catch them on the full run of the tide, ebb or flood, just about dusk in the evening; and a more game fish I have never taken. Just at dusk you should see them play! They skip on top of the water and jump clear out of the water in pairs or more; and sometimes you can see 20 or 30 jump clear out of the water at once. Two or three when caught, and on taking the hook out of their mouths, ejected or spit out five or six of the little shad, same size as the samples I send you.

Here is something new—a nut for the Naturalists to crack—shad subsisting on themselves the same as brook trout. You should have seen the people start when we brought them ashore and told them how we caught them. They would hardly believe it; never had heard of such a thing in their lives!

I read of a man down in Connecticut last Spring taking full-grown shad with an artificial fly. Next Spring, if I live so long, I am going for some of the full-grown ones with the rod and reel.

I have caught hundreds of bass since I wrote you last; caught a fine mess to-day; but this fishing can't last much longer, as the water is getting cold, and as soon as we get a good rain to roil the water the jig will be up with us. I could have caught you all the bass and white perch you wanted for stocking your ponds and rivers, only our fishermen say they won't live; and when they catch them they never put them in fish-cars with other fish to keep alive, as they say they won't live; but I believe they can be transported with care, if managed right. The bass we now take run from 4 oz. to 1½ lbs., sometimes two pounds. We use for bait a squid made of tin or zinc—not a trolling spoon, same as used for pickerel and black bass, but a squid of our own get up; and we also take them with live bait. Have discontinued tin foil, but believe we could catch shad with it. It is too soft, and soon gets out of shape by the action of the tide; hence the squid.

I believe these shad could be caught with a fly, but have none at present except some small trout flies, and they soon make mince meat of them. I use a good-sized Kirby hook, and generally hook them firmly in the lower jaw; and they make splendid play. P. A. M. VAN WYKE.

New Hamburg, N. Y., Oct. 18.

Dairy Husbandry.

COLLECTING STATISTICS OF THE DAIRY.

In a recent number of the Western Farmer, a quotation is made from the RURAL NEW-YORKER in regard to the importance of collecting statistics of the dairy—viz., the number of factories, the cows employed, and the quantity of cheese made annually. We regard it unfortunate for the dairy interest of America that these statistics are not more fully given in the reports of the various dairy associations, and this work, we think, properly belongs to the associations, etc.

The Western Farmer, after alluding to a conversation which one of the editors of that paper had with certain Ohio dairymen—owners of large farms and patrons of two cheese factories, and yet who had never attended a dairy convention, and were surprised to hear of cheese factories in Wisconsin—remarks as follows:

"Will Mr. WILLARD tell us how to collect statistics that shall be complete—bearing in mind that our Ohio friend is not alone—that there are other dairymen, and some factory owners, who take no agricultural paper, attend no dairy meetings, have never heard, except by accident, of Mr. WILLARD, or any other writer on dairy matters? Another class are willing enough to get all the information they can from others, but act as if it was no one's else business what they have done in their own dairy or factory.

"One of the editors of this paper happens to be Secretary of the Northwestern Dairymen's Association. He will do what he can to collect full statistics of the dairy products of the Northwest, but he is not at all sure that he will succeed better than his predecessors. All the help that can be given in the way of making dairymen feel the importance of such statistics, and any suggestions as to the best modes of securing such statistics, he will gladly welcome."

We are aware that there are difficulties in the way of obtaining dairy statistics, and are fully satisfied that but little dependence can be placed upon getting the information desired, from voluntary contributions. We have had some experience in this line and we find there are only a few persons, comparatively, who will take the trouble of writing out a report of their own immediate operations, to say nothing of collecting statistics from others. Sometimes persons would be glad to make report, but find difficulty in getting it in proper form to suit, and so abandon the idea altogether. The dairy associations should furnish printed forms with blanks to be filled. These should be sent to all factories which are known to the Secretary, with request that the blanks be filled up and returned. But much information may be obtained by sending blanks and a printed letter to the Presidents or Secretaries of the County Agricultural Societies. A list of names of these officers may be obtained at the office of the State Agricultural Society. The Department of Agriculture at Washington issues a printed list of the various Agricultural Societies in the United States, giving the names of officers. This would be found useful in sending out circulars. Again, every town in the State could be reached by placing the requisite blanks and circulars in the hands of the several Boards of Supervisors; and this could be done through the County Clerks. The Supervisor of each town would be likely to be pretty well informed as to the number of cheese factories in his town and the cows employed in furnishing milk, etc.

By adopting some such plan as we have proposed we are inclined to think the statistics could be made tolerably complete—at least much more complete than we now get them in the dairy reports. We think, too, that at the Dairy Conventions a committee on statistics should be made, selecting some well known person from each county who is to be relied upon to collect the statistics of the counties respectively. All this will entail much labor, it is true, upon the Secretaries of the various Associations; but they should be properly paid for the service.

Some years ago we furnished statistics of all the factories and cows in Herkimer county, and we were the first to obtain and print reliable returns of the quantity of cheese shipped annually from the county. This last was not such a difficult matter, since the various railroad depots and canal ports keep a record of shipments, and by applying at the several places the desired statistics were very cheerfully furnished. We have tried from time to time to have the American Dairymen's Association take measures to get the shipments of butter and cheese in the other counties of New York, but no systematic plan for obtaining this information has been adopted.

The dairymen of America, as well as the dealers who handle dairy products, are greatly in need of accurate statistics upon which to base their operations of selling and buying. Prices are largely regulated by the receipts and shipments at New York city; but these do not always indicate what is being done in the whole country. It is very important to the dairymen of the East to know how dairying is progressing in the Northwest and in Canada; and it certainly is of equal importance to our Western and Northwestern friends to have a knowledge of their own progress, together with the condition of the business at the East.

We feel greatly the need of accurate statistics from year to year, and we are sure Mr. MORROW is not insensible to their importance for the dairy interest of the Northwest. In our suggestions respecting the collection of statistics we do not pretend to give the *best* plan, but only that which has occurred to us as feasible. We hope the excellent Secretary of the Northwestern Association will mature a better plan than we have named, and whatever he may do in the way of making the statistics of the dairy more complete, will be very fully appreciated by us and by many others at the East who have the best interests of the dairy at heart. The Western Farmer is doing good service to dairymen in calling attention to this subject, and we hope that every factoryman who may read this article will send statistics of his factory operations to the Secretary of his State Dairymen's Association.

DRAWING MILK TO FACTORIES.

WHAT is the usual price for drawing milk in the dairy districts of New York?—W. R. PALMER, *Wattsburg, Pa.*

IN Herkimer Co. the milk is generally carried to the factory by patrons. In some other counties, however, milk teams are employed to gather up the milk and deliver it. The price varies, according to the distance, condition of the roads, etc., from a dollar to two dollars per cow. Sometimes a patron living on a road at the end of a route, with several farm houses between his place and the factory, engages to draw all the milk on the street. As his own milk is to be delivered, there is no additional journey to be made in hauling the milk of his neighbors along the route. In such cases milk is often delivered to the factory at cheaper rates than those we have named. When patrons are located near together on good roads, the most distant farm being no more than a mile and a half from the factory, about one dollar per cow is considered a fair remuneration for drawing the milk. It must be evident that no uniform price can be given for different localities, since there must be a variety of circumstances that will have controlling influence in regulating the rates of delivery for each.

We believe that the proper way for delivering milk to factories is to have teams employed specially for the purpose. The wagons should be provided with springs, and have an awning or covering so as to protect the milk cans from the sun or rain. It seems to be the general opinion among patrons who have tried both methods—drawing their milk with their own teams, or having it drawn by a public carrier—that the latter is the cheaper, where a fair, honest price only is charged for the service. In many cases patrons prefer to pay even pretty high rates, since it relieves the farmer from much care, to say nothing of the time of his man and team, which can be employed at other work. At some of the factories the proprietors or company collect the milk from patrons, and make the cheese, etc., at a certain rate per pound, or at so much per cow, for drawing the milk, according to distance to be traveled, etc. This is a very good way, as the business is more under the control of the factory manager, who is also responsible for accidents, mishaps, etc., thus giving less trouble to patrons.

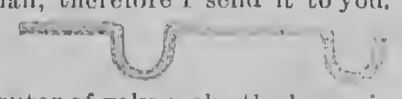
DAIRY NOTES.

Butter Making in South America.—A correspondent of The Methodist, writing from Brazil, says: "In South America there are four native modes of making butter. The first is, putting the milk in a common bowl, and beating it with a spoon as you would an egg. The second, pouring the milk in a bottle, and shaking it until the butter appears, which is extracted by cracking off the top of the bottle. Bottles are valueless in this part of South America, on account of the number imported with fruits and liquors. The third, where the dairy is more extensive, is performed by filling a hide with the milk, which is lustily shaken by an athletic native at each end. The fourth, by dragging the hide after a galloping horse, until it is supposed the butter is formed. The milk is never strained and the butter never washed. I am speaking of the native mode. Of late years, English and Scotch people have introduced a few regular Yankee churns. The greater part of the butter used in the cities is imported from Ireland, France, or Germany, while thousands of cows graze on the vast pampas in South America.

Farm Economy.

ECONOMICAL NOTES.

Another Neck Yoke.—Looking over the different styles of neck yokes in RURAL NEW-YORKER of Oct. 12, I did not see my plan, therefore I send it to you. For the



center of yoke make the large ring to go on tongue and weld the two small rings to play in large one; then take an iron rod of suitable size and make after the following plan:—Flatten the ends and punch for nails; then make a groove in the wood to correspond to the iron; then make two bands for each side of center of yoke; slip the rod through the small rings that are attached to the large one, place the rod in the groove and rivet on the bands close up to the small rings. The nails can be driven on the outside of band or partly in the band; or a hole drilled in the bands, if made to match. I use one that I made over four years ago, and is just as solid as ever. This plan strengthens the yoke instead of weakening it, and it can be made smaller.—H. JOHNSON.

Linseed Oil Barrels for Cider.—In your issue of Oct. 19 WM. J. RICHARDSON inquires about the utility of linseed oil barrels for storing cider, and you discouraged the use of them for that purpose. Our experience is to the contrary. Many years ago there was a scarcity of cider barrels in Vermont, and linseed oil barrels were made use of to supply the deficiency, with no other cleansing than to rinse them out thoroughly with cold water. In the following Spring it was found that cider thus stored was better for drinking purposes than that kept in other packages, the reasons assigned being that the oil tended to preserve the cider mainly by forming a thin film on its surface, excluding the air. Linseed oil being a vegetable production from flaxseed, cannot, in small quantities, be very unwholesome if *pure*.—D. G. CHEEVER, *Rock Co., Wis.*

I would say to WM. J. RICHARDSON that I have used linseed oil barrels for cider and can recommend them. I cleaned by scalding thoroughly four or five times in succession. I like them best; they don't sour.—A. R.

Arresting Fermentation of Cider.—In one part of your last paper you tell a correspondent how to filter cider, and soon after detail Prof. HORSFORD'S mode of arresting fermentation. I will give you my opinion. Prof. HORSFORD'S plan is good in a large establishment, or when conducted by a man knowing something of chemistry; but the simplest mode is to filter the cider just as you have stated, through sand and charcoal, and then throw into the barrel from three to five pounds of fresh beef. The quantity is governed by the acidity of the apples from which the cider was made, the most acid requiring the larger quantity of meat. The principle upon which it acts is, the albumen acts upon the acid and prevents fermentation. In your detail of Prof. HORSFORD'S process you do the same thing by using the eggs. Bi-sulphite of lime is largely used by lager beer men to prevent acetification; but at present not many cider makers make any use of it.—C.

WE have also arrested fermentation by throwing into a barrel of cider, when it had reached the condition of fermentation suited to our palate, a half pint to a pint of flaxseed.

Fertilizer for Virginia Lands.—A correspondent of the Southern Planter and Farmer gives the following recipe for a fertilizer, which he says he has found to be the cheapest and most efficient of any he ever used. This is the recipe and probable cost:

1 ton No. 1. Peruvian guano, cost per ton.	$80 00
1 ton salt (ground alum)	15 00
1 ton raw-bone	55 00
½ ton land plaster	8 00
	$158 00

He adds:—"This will make your manure cost you about $40 per ton, and 250 pounds per acre is quite enough for cotton and I suppose would be for wheat or corn. You see this will cost just $5 per acre, and no man can manure an acre of land as cheap with any other manure, especially the heavy stable manure, even if it were given to him. I have been using this compound on cotton, alongside of most of the standard compounds, and I have seen nothing equal to it on my lands."

Arboricultural.

INFLUENCE OF STOCK ON GRAFT.

AGAIN I ask for information. A few of my Malden's Blush apple trees, which were top-grafted on hard Winter apple stems, ripen a few weeks later than others in the same orchard which were root-grafted. Therefore, does the sap of the original stem uniting with that of the graft so materially belate the fruit? If this question is of any interest or of any practical importance, I await an answer.—JOHN D. PHILIPPI.

OF course the sap taken in at the roots passes up through the stem and branches to the leaves, but it is little more than pure water, containing inorganic materials which become organic when assimilated by the leaves, and then as it descends the change takes place, the original cells of both stock and graft forever fixing the type of all those on and around each. Now, to make the matter plain, let us suppose that the cells of quince wood are an exact cube while those of the pear are triangular. We graft the pear upon a quince root, and of course all the nutriment or materials necessary for the growth of the pear must be gathered by the quince roots from the soil (except the little taken by the leaves). These substances are carried up through the cells of the quince wood and then through those of pear to the leaves, where they are assimilated, coming in contact with air, and receiving certain gases therefrom, after which commences the downward course between the wood and bark, forming new cells. The type or form of the pear wood cells, in those of the cion or bud first inserted, being triangular, others are added of the same shape; but as the assimilated sap reaches those of the quince stock the cube form is assumed, because the first ones are of this form. Something of this kind actually takes place in all grafted or budded trees, because the stock remains unchanged as well as the graft.

When we graft the pear on quince stocks we always find the quince unchanged through all time, although it has been carrying up crude sap to the pear and receiving assimilated or true sap in return with which to extend its own bulk. The gases received from the air, so necessary for growth, have been gathered by pear leaves, and still the quince retains its own distinctive characteristics. The distinct vital powers of each species and variety enable it to form and retain its own distinctive characters out of the materials which may pass through others that are more or less different in appearance or structure. There has been an occasional freak or departure from this rule, or at least an appearance of such, but they are quite rare.

The difference in the ripening of your Maiden's Blush apples, may be accounted for, theoretically, in many ways; but we presume that the stocks, which you say originally produced very late, hard apples, also naturally started to grow late in Spring, consequently the grafts upon them would not be pushed into growth as early as upon stocks of an opposite character. The stock does have an influence upon the graft, and the graft also has its influence upon the stock; but seldom is it sufficient to materially change the character of the fruit. The Rawle's Janet, which is one of the latest of apple trees to show its leaves in Spring, would be an excellent variety upon which to test our theory as regards late ripening, caused by tardiness of the growth of stock in Spring. To give all the facts in our possession relating to the influence of stock on graft, and *vice versa*, would require more space than we can spare at present; but we hope the above hints will enable you to look for causes as well as effects.

ARBORICULTURAL NOTES.

Olive Oil in California.—A Writer in the Overland Monthly publishes the information that the culture of the Olive tree and the manufacture of oil from its fruit, is gradually becoming a leading industry in California. The character of the climate, and the soil of the valley of Santa Barbara and of the foot hills of Santa Inez, for sixty miles along, are adapted to the production of the finest varieties of oil. It is predicted that this portion of the State will eventually be numbered among the most celebrated oil districts of the world.

New Material for Tying up Fruit Trees.—The Pomological Institute of Reutlingen (Germany) offers for sale strips of tape prepared with India rubber, which are said to be very serviceable and durable for this purpose. These strips are 2⅓ feet long, and about ¼ inch wide, and are sold at the rate of 2½d. per 100.

Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

Transplanting Fruit Tree Seedlings.—*Oct.* 20.—A few weeks since I referred to my success in transplanting young trees from the forests, particularly with the Tulip tree, as this is one generally considered one of the most difficult to transplant and make live. My success was attributed to severe pruning at the time of removal, and I advised others to try the same system; not supposing for a moment that I had discovered anything new or told anything that had not been told a thousand times before. It appears, however, that Mr. R. S. ELLIOTT, Industrial Agent of the Kansas Pacific Railroad, saw fit to take me to task for even hinting that everybody did not know that trees should be severely pruned when transplanted; and an entire column of the Prairie Farmer is devoted to telling how little I know of forest tree culture, as well as other Eastern men, and how much knowledge of this kind is in the heads of all Western men. I am also informed that my transplanted Tulip trees may grow luxuriantly the first season and die the next, as did some that were planted but not properly cared for by Mr. ELLIOTT. If the experiment to which I referred was my first, I might have some fears in regard to the result; but a quarter of a century of continued practical experience, gives me confidence of success, in spite of the hints of the well-meaning gentleman critic. But the gentleman is so positive in his assertion, and polite withal, that I cannot refrain from putting a few paragraphs in my Diary, to wit:

So far as the treatment given by the gentleman is concerned, pruning, etc., it is all very well, but he is mistaken if he supposes that his article sheds any new light on the subject for western tree planters, however kindly he may have meant it. This whole subject, including the tulip tree with others, has been discussed and re-discussed in the West, until it is fully as well understood as in the East; and the tulip tree in particular has been so fully "ventilated" (genteel slang) in the Illinois Horticultural Society, that our New York friend comes rather late with his discovery that the native seedlings may be taken from the forest and made to grow. Even before we had ARTHUR BRYANT'S book, there was a mass of information scattered through various western publications that went far beyond any of the teachings that we could get from the East. Nearly two years ago I had occasion to hunt up all that could be laid hold of on forest tree culture, and I found the eastern publications of much less value than the western.

I cannot understand why he should think there was any attempt to shed any new light on the subject, especially for those who read and reason; but every child must learn the alphabet before he can read, and there are still a great many children in this world, and the lessons must be repeated until all have learned them. I am happy to learn that Western men are so much ahead of Eastern in horticultural matters, and it's a great pity, for the sake of argument, that so few were born there, or were obliged to take their first lessons in horticulture from books and papers written and printed in the East. I have often thought it was a burning shame that we had to look across the Atlantic Ocean to the works of such men as LINNAEUS, JUSSIEU, DECANDOLE, DU BRUIEL, LOUDON, LINDLEY, HOOKER, and hundreds of such noble men for information in regard to the plants of America, as well as those of other countries. Of course down here "near New York" we are not so prejudiced against *Eastern men* as they are out in Kansas, consequently we gather knowledge from whatever source it may come. But Mr. ELLIOTT thinks Western men understand this subject of pruning and transplanting thoroughly, and I have no doubt of it; but there are some few very prominent exceptions: and to please the gentleman I will send one of his "chickens home to roost" (genteel slang) by quoting the words of Dr. STAYMAN of Leavenworth, Kansas, a prominent horticulturist of that State, who has advised, and for aught I know to the contrary, continues to advise planters not to prune newly transplanted trees, even if the subject "has been fully discussed and understood."

In the Gardeners' Monthly, 1868, page 55, is a letter from the gentleman named, from which I quote the following:—"Last Spring I had 400 apple trees transplanted, five years old; many of them were two inches in diameter and more than twelve feet in hight; not a limb or twig was cut off or shortened except on a few done in the nursery for another party. They were set on a new piece of land on the highest elevation, exposed to the full rays of the sun and prevailing winds, and only four died. Another party got 100 trees and set them out according to my directions and did not lose any."

Now here is one very prominent Kansas horticulturist who not only persists in leaving his own trees unpruned, but advises his neighbors to do the same thing. It is about time these flings about a knowledge of horticultural affairs being local should cease, inasmuch as railroads and telegraphs bring far-distant regions of our country into close and frequent communication, and what is known and being done in one is pretty well understood in another. Besides this, the men who are residents of one State to-day may be in another to-morrow.

Making Gilt-Edged Butter.—*Oct.* 21.—Mrs. RURALIST desires me to say a word in my Diary in behalf of her own sex, who may try and fail to make what is of late been known as "Gilt-Edge Butter—*i. e.*, butter of the very best quality. She says that a majority of men who keep cows are so unreasonable as to suppose that their wives can make first-rate butter out of the poorest milk, with none of the necessary conveniences for its manufacture. Womanlike, she declares that the unreasonableness of the men in regard to this matter is past comprehension; they will keep cows which give milk blue enough for a background to the "Milky Way," and then expect their wives to make first-rate golden butter therefrom. In addition to this there is no cool milk-room for Summer or warm one for Winter; no ice-house or cold water with which to cool milk or butter, and if a poor, lard-like article is the result, the butter maker receives the blame. Now, I have no remonstrance to make to this outburst of indignation on the part of Mrs. RURALIST, because I—yes, *we*—know it is truth. Mrs. R. never failed to make gilt-edged butter when I furnished the materials and conveniences; but it has so happened during our domestic life that I have owned splendid looking cows that gave a large quantity of milk, from which good butter could not be made; while others were just the reverse. Of course, man-like, I was a little stubborn at first, and even hinted that the fault of the butter was owing to the bad management of the women-folk; but a little Alderney blood introduced into the barn-yard made a wonderful change in the appearance of the butter. Of late years, when traveling about the country and happening to sit down at a farmer's table where the butter looks "lardy," I never think of blaming the good wife, but pity her, because I know she might possibly make good butter if furnished with the right materials and conveniences for so doing. The first step is to procure cows from the milk of which good butter can be made; then supply the conveniences for its manufacture, and then "Gilt-Edge" butter will become the rule instead of, as now, the exception.

Protecting Tender Plants.—*Oct.* 22.—The cold North winds remind me that Winter will soon be here, and tender plants must soon be protected. Tender roses I either take up and bury in trenches, or bend down the tops and cover with soil, the same as we have to do with most of the foreign varieties of the raspberry. Some of the tender evergreens, such as the *Retinisporas*, *Rhododendrons*, *Azaleas*, *Mahonias*, and Hollies, that are not perfectly hardy, I tie up loosely with straw. The variegated Ivies, both Japan and English, which are trained up and over rocks, are covered with a thin layer of straw or hay; just enough to keep them well shaded and prevent frequent freezing and thawing during the cold months. Herbaceous plants, even those that are quite hardy, are greatly benefited by a slight protection; and the best material for this purpose is coarse barn-yard manure.

Tall-growing herbaceous plants, such as the *Erianthus*, *Arundo donax*, *Bocconias* and *Hibiscus* should be cut down when the tops are killed and the crowns well protected. A few hours work, with proper materials for covering, will make a wonderful difference in the appearance of such plants next season. All vines that can be readily laid down, whether hardy or otherwise, I give protection in Winter, as the expense is more than repaid in vigorous growth and abundant bloom.

GRAY AMERICAN WOLF.

The Naturalist.

OUR FUR-BEARING ANIMALS—VI.

GRAY AMERICAN WOLF.

Canus lupus (grisens)—AUDUBON.

THE common wolf is found throughout the temperate and polar regions of this Continent, difference in color giving it different names, and the color, varying with the climate, changing from the pure white, found in the Arctic countries, to gray, further south, and still farther, to black.

The body of the Gray Wolf is four feet long; its tail, one foot five inches. It has a long, naked, roundish muzzle; ears, erect and conical; eyes, oblique; teeth, very strong; body, long and gaunt; tail, straight and bushy; behind the cheek is a bunch of hair, like a collar. The hair is of two kinds—the longer, coarse and stiff; the under fur, soft and woolly. The general color of the upper surface is a dark brindled gray, with a dorsal line a little darker than the sides; the under parts are dull white. Most of the long hairs are whitish toward the roots, then dark-brown, then light-brown, and finally tipped with black; the under fur is ashy-brown; the tail is colored nearly like the back.

In newly settled countries wolves are very numerous and exceedingly troublesome. Slaughter and destruction seem their chief delight, and during their marandings they keep a horrid and prolonged howling, a frightful sound to the settlers, whose sheep, colts, young cattle, or dogs, or, perhaps, an unwary child, straying in the field, or a traveler in the woods, furnish a meal to the ravenous beasts. Wolves generally hunt in packs, and sometimes, especially in Winter, they will destroy whole flocks of sheep, merely drinking their blood and eating a small portion of the tenderest parts. They are fond of wild turkeys and similar birds. In the forests they prey upon foxes, hares, and such animals, and are very destructive to deer, so that these are found to increase in regions that have been cleared of wolves. They will pursue and kill mules and colts near trading posts, always selecting the fattest, and will also chase and kill buffaloes. They prowl around the outskirts of an army in search of offal, and after a battle they often prey upon the dead before the survivors can give them burial. They sometimes attack persons, but only when driven by hunger; and in similar circumstances they fall upon and eat the young and weak of their own number. Wolves are strong, agile and cunning, like the fox. They can be tamed, and trained to hunt like hounds. They produce their young in early Summer, from four to eight in a litter.

When there is any appearance of danger wolves ramble off, and generally make for unfrequented hilly ground, and, if pursued, gallop at a quick pace, almost equal to that of a good horse. They are so swift, and of such good wind, they are seldom pursued by hounds in open chase unless wounded.

Traps and snares of various sorts are set for catching them in those places where they still abound. Hunters, in the Adirondacks, catch them by setting traps in their paths without bait, and fastened to a heavy clog. They are concealed by moss, and must be set with great care and skill, as the wolf is a more suspicious animal than even the fox. Sometimes the traps are set in water and baited. Another way to catch them is by pits. A pit is dug about eight feet deep, larger at the bottom; its mouth is covered with a revolving platform of boughs attached to a cross-piece of timber serving as an axle; on this platform, which is balanced by a heavy stick of wood, putrid venison is tied for bait.

Probably a better way is to suspend the bait to a branch hanging over the pit, into which the wolf falls in leaping to get the bait. AUDUBON tells of a man who found three large wolves in one pit. He boldly went into the pit, taking a knife but leaving his gun above. The wolves, overcome by fear, cowered in the corners. The woodman caught them, stretched out their hind legs in succession, and hamstrung them with as little fear as if they had been lambs. He then hauled them out of the pit and gave them over to his dogs, only one, an old female, showing much fight; she scuffled along on her fore legs, snapping and biting, and defended herself so well she was necessarily killed to save the dogs. But it is not safe to trust too much to the cowardice of the captured animal; for an old wolf-trapper, of Vermont, told us that, having caught a wolf in a trap, he went up to knock it in the head, when the animal sprang at him furiously, snapping his jaws with great violence within a few inches of his face.

The skins are greatly used for sleigh robes, and make very durable overcoats. The price of a skin is about three dollars. The flesh is sometimes eaten by Indians, but probably by no others, except in cases of great necessity. R.

NOTES FOR NATURALISTS.

The American Widgeon, or Bald-Pate.—SETH GREEN writes the RURAL NEW-YORKER:—"I see it asserted in a recent RURAL that the American Widgeon is a great diver. This is a mistake. He does not dive; he takes the feed away from the Canvas and Red-head after they bring it to the top of the water." Mr. GREEN is right, and our correspondent, who made the statement alluded to, wrong, as he will quickly learn by more careful observation.

Management of Gold Fish.—Will some of the readers of the RURAL NEW-YORKER, who have had experience, please tell the best way to keep gold fish—what kind of water to keep them in, how much to feed them and how often? Will they thrive well in a globe? If not, why not?—A NEW SUBSCRIBER.

The Garden.

ANTS IN A GARDEN

THE RURAL NEW-YORKER has had so many inquiries as to the best modes of destroying ants in gardens and orchards, that we copy the following from a foreign journal:—The most simple and effectual way to destroy ants is to pour boiling water on the nests at night; but if the nest should be in a pot among the roots of a plant, the best way is to immerse the pot and plant in cold water, and let it stand for five or six hours, in which time the ants will all be drowned, and their eggs destroyed.

A very effectual plan is to place raw meat in dishes or vessels of any kind about places which they infest, and, as they prefer that kind of food to any other, they surround it in thousands. Boiling water is then poured upon them, and this, if persistently applied, with the bait above recommended, will in time effect a good riddance.

The following mixtures have also been found successful:—4 ounces of quassia chips, boiled for 10 minutes in a gallon of water, dissolving in the liquid while cooling 4 ounces of soft soap. Or take 1 pound of black soap, dissolve it in 4 gallons of water, and sprinkle the solution through a fine rose over the runs and nests, taking care, however, not to water the roots of the plants with it.

The following poison is highly spoken of: Ferrocyanide of potass, 1 dram; raspings of quassia, 1 dram; sugar in sufficient quantity to form a syrup. The ants are said to devour this greedily and die almost immediately.

It is not generally known that fresh Peruvian guano will drive ants from any spot, however firm a hold they may have obtained on it. Paraffin and benzolline oil are said to have the same effect. Turpentine, gas-water, flowers of sulphur, lime water, a decoction of Elder-leaves, chloride of lime dissolved in water, and camphor have also been recommended. Suppose a colony of ants to be commencing operations on a lawn, it is an easy matter to trap them all by placing a large empty flower-pot, with the hole stopped, over it. The ants will build up into the pot, and in a short time it may be lifted with a shovel and be carried away and dropped into a vessel of water, which will make an end of them. When they make a run up the stem of a fruit tree, a line of gas tar all round will put a stop to their progress and do no harm to the tree. To poison them, mix arsenic with sugar and water, put the mixture in a saucer and lay a slate over it, and on the slate a stone. This, of course, is a dangerous plan, and any who think of adopting it must use their own judgment as to the safety of any larger animals. It is said that ants will avoid any tree which has a circle of chalk around the stem.

In houses and other places where hot water cannot be poured on the soil without danger to the plants, pieces of coarse sponge dipped in diluted treacle will form a most effectual trap. The ants will crowd into the sponges, which should be taken up from time to time and thrown into a vessel of boiling water. An equally effectual plan, in such places, is to lay half-picked bones about. These will soon be covered with ants, and can then be thrown into a vessel of boiling water, after which they should be again laid down to attract a fresh batch of victims. By persisting in the use of either of the two last-mentioned traps, a house will be completely cleared of ants in a short time; the sooner, of course, in proportion to the number of bones or sponges employed.

In the *Revue Horticole* for September, 1870, the following method of destroying or banishing ants is described as having proved quite successful:—Take 2 ounces of soft soap, 1 pound of potash, and about 2½ pints of water. Boil the whole together for some time, stirring the ingredients occasionally. The liquor may then be allowed to cool. With a pointed stick or dibble make holes here and there in the soil infested by the ants, at a safe distance from any plants which may be growing there, to avoid any chance of their roots being injured by the mixture (although this is doubtful), and fill the holes once or twice with the preparation. By this means M. de Forghet was completely successful in clearing his melon beds of these troublesome insects.

SEXES IN PUMPKINS AGAIN.

SEVERAL months since we endeavored to make it clear to one of our correspondents that there were no such things as male pumpkins, squashes, melons, or cucumbers, although there are pistillate (female) and staminate (male) flowers on the same vine. The more absurd a thing may be the more persistent will some men, and women too, stick to it, reason, common sense, and their own senses, if they possess any, to the contrary. This question in regard to the sex of pumpkins, is still going the rounds of the agricultural press, and as a fair sample of the belief of many farmers, we give the following, clipped from one of our exchanges:

If you will examine a lot of pumpkins at the blow end, you will find they are male and female; on the male you will find a a protuberance, and in the female a cavity (the deeper the better). I have raised pumpkins for more than thirty years, and never failed of a crop excepting when the striped bugs got the upper hand of me.

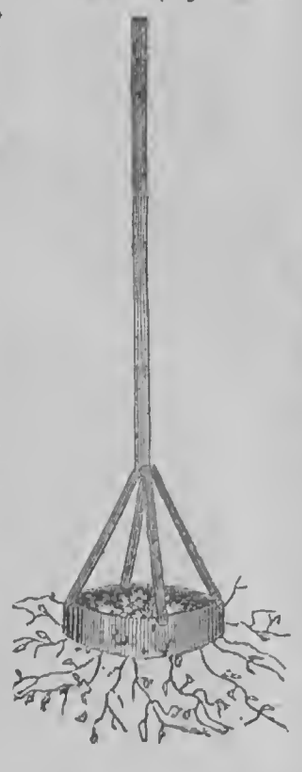
A FARMER.

A man might, with just as much reason, declare that a cow was not a cow but a bull, because her horns were a little shorter or longer than some other cow. We will say once more, that pumpkin vines produce two kinds of flowers; and to make it plain, we will call them male and female. No pumpkins are ever produced from the former, and they are of no use except to make the latter produce seed. If we remove every male flower while in bud, and before they open, we will still get pumpkins all the same; but fertile seeds will be wanting to make them perfect. English gardeners have tried the experiment over and over again with cucumbers, forced under glass, and unless they desire to raise seed, they do not trouble themselves to fertilize the female flowers artificially, which is necessary with such plants when grown in a confined atmosphere.

This idea of the sexes in pumpkins belongs to the dark ages and not to the 19th century. We suppose there are men and women who will still believe, as they always have, in spite of the light which science throws upon such things, just as they will cling to the belief that the signs of the zodiac, put into almanacs for the special accommodation of ignorant and superstitious people, have foundation in nature. Men will continue to plant their vegetables, kill hogs, and do many other things during a certain phase of the moon; while their wives wean their babies under the same rule, believing that the moon actually has some influence in the matter.

We are not disposed to call these people by harsh names on account of their ignorance, because we have many men in very high places who are constantly talking nonsense of an equally absurd character. It is not very reasonable to suppose that our great botanists, who have studied plants all their lives, could be so careless or ignorant as not to know as much about pumpkin vines as men who do not know even the rudiments of the science; then what shall we say of a man who virtually declares that he can pick out male and female pumpkins, while every scientific botanist that lives, or has lived, is against him. Our greatest authority in America, Prof. GRAY, says of the genus *Cucurbita*, in which we find the pumpkin and squash:—"Flowers, large or middle-sized, on separate simple peduncles in the axils. *Both kinds of flowers solitary in the axils.*" Why should he speak of *both kinds* of flowers if there were not two. Of the cucumber (*Cucumis*) he also says: "Sterile flowers, clustered fertile ones, solitary in the axils." In other words, the male flowers which are sterile or produce no fruit are produced in clusters, while the females are solitary. But we have said enough to make a blind man know pumpkin blows if he could not see them.

A Strawberry Trimmer.—AUSTIN S. DRAKE sends to the Fruit Recorder the following and illustration, which we copy: "This 'Strawberry Trimmer' (my invention) is a hoop two or three inches wide, and about three feet long; the ends lapped by with a set screw. This hoop is of saw plate, the lower edge sharpened, while to the upper are attached thin strips of iron, which unite to a wooden handle about five feet long. One downward stroke with the machine removes all the runners from the plant, like cutting out biscuit with a cake-cutter; and it is so much less fatigning than stooping over and blistering one's fingers with shears."



The Horseman.

HORSE DISTEMPER.

I HAVE a valuable mare that had the horse distemper, or diptheria, in the month of June. She did not break under the jaws like my other horses, but appeared to break inwardly, and threw a great quantity of matter out of her nose. She did not get along very well; she has a lump under her jaws where she swallows, she breathes and rattles all of the time, with a light hacking cough. I have given her ginger in her feed, but it did not seem to do any good. I am now giving her tar from the pine knot. She is in fine condition, but coughs and wheezes and throws matter from her nose. You will confer a favor by inserting this in the RURAL, as I would like to find out something that would help her.—E. T. McC., *Greenfield, Ind.*

THIS animal evidently has not recovered from the strangles, and we can do no better than republish an article, with illustration, given in RURAL NEW-YORKER June 1, 1872. Fig. 1. illustrates the head of an animal

FIG. 1.—SEVERE ATTACK OF DISTEMPER.

with a severe attack of distemper. This distemper is another form of sore throat familiar to every one. Its design seems to be to throw some poisonous matter from the system, and the object should be to keep the strength of the animal up and hasten suppuration. The horse is out of sorts; the neck becomes sore and stiff; an enlargement appears, which is first hard and tender; there is some discharge from the nose. The case usually grows worse, if very severe, often threatening to cause suffocation; horse unable to eat or drink but little, and strength is lost rapidly. Use freely a poultice made of wheat bran and warm vinegar, changing as often as the poultice becomes dry, using the eight-tailed bandage, (see fig. 2) until the enlargement

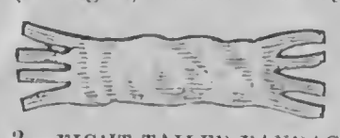


FIG. 2.—EIGHT-TAILED BANDAGE.

becomes soft and can be opened, when relief will be prompt. Or the following treatment may be adopted, which is similar, and if the alteration is not good, is preferable: Take spirits of turpentine, two parts; spirits of camphor, one part; laudanum, one part. Put this on the neck with a brush, if convenient, or any way to apply it without exciting pain, three or four times a day, until soreness is caused. After each application, have ready three or four pieces of flannel, which should be a thick article; put these over the parts and bind on with the eight-tailed bandage (see fig. 3.) When the

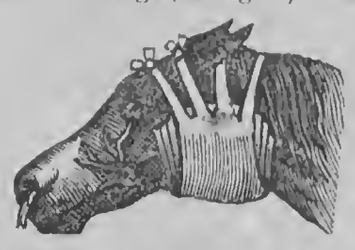

FIG. 3.—APPLYING EIGHT-TAILED BANDAGE

tumor points, open it (see fig. 4), and be sure that the matter has a thorough outlet. Sometimes the inflammation is so deep as

FIG. 4.—OPENING ABSCESS IN DISTEMPER.

to cause serious soreness and swelling of the throat. In this case the horse must be nursed carefully, by feeding with warm gruel; the drink should be warm; grass, or anything that will tempt the appetite, should be given. Simpler treatment would be rubbing on the enlargement an ordinary fly-blister, to bring the enlargement to a head. Physic must not be given.

THE HORSE DISEASE.

THIS disease has seriously affected the busines of New York City and Brooklyn the past week, and does still. The details of its extent, the number of fatal cases, etc., might be interesting to our readers, but we have no space for such detail. The Professional Veterinary Surgeon who so ably edits the Veterinary Department of the Spirit of the Times gives, in that paper, the following:

The disease is manifestly a *catarrhal fever*, or influenza, probably depending upon some *specific* atmospheric influence, as is shown by its appearing simultaneously in all parts of the city, attacking all kinds of horses, old and young, in good condition or in poor.

The premonitory symptoms of this malady are a staring coat, watery discharge from the nostrils, hot mouth and cold extremities. The throat and bronchial tubes soon become involved, more or less, producing a severe hacking cough. The discharge from the nostrils increases, becoming of a thicker consistency and of a yellowish-white color, coming away in large quantities. The pulse is accelerated and the respiration more or less increased. When affected animals are exposed to vitiating influences, such as impure air, resulting from filthy and ill-ventilated stables, or from exposure to cold storms or severe work, the lungs become affected, producing alarming and more dangerous symptoms.

This disease, although it has created great excitement and alarm, and has proved to be of considerable loss and annoyance to owners of horses, and to the community generally, is not likely to be attended with any great fatality. It will run a certain course, and as far as we have had an opportunity of observing, it will take from 10 to 20 days, according to the severity of attack, before an animal completely recovers.

In the treatment of this disease, as in all diseases of the respiratory organs of the horse, it is of the greatest importance to insure a sufficient supply of pure air; therefore cleanliness, and comfortable, well-ventilated stables are found to be of the utmost benefit in mitigating the symptoms and in hastening the period of convalescence. If the animals are not severely affected, gentle exercise or even moderate work does not appear to be hurtful. As a matter of course, the body should be kept warm by proper clothing.

As to medicinal remedies, we prefer the preparations of potash—say chlorate of potash, nitrate of potash, and liquorice powder, in equal parts. Dose—a tablespoonful daily in food. In case the animal refuses all kinds of food, as occasionally happens, then a little of the powder by means of a teaspoon may be carried to the base of the tongue at short intervals during the day. When the cough is severe relief may be afforded by a mustard application to the throat and windpipe. The nostrils should be sponged out several times a day with tepid water, and afterwards washed with a weak solution of bromo chloralum or carbolic acid. The stable should be disinfected daily, with either of the above disinfectants or chloride of lime. When the animal is weak the strength must be supported by stimulants. In all cases the food should be such as is nourishing and easily digested. Depletive remedies, as bleeding, purging, severe blistering, and the use of powerful drugs, as aconite, belladonna, digitalis, emetic tartar, etc., should be carefully avoided, as great harm and irreparable injury may be done by their incautious use, as well as from the nostrums and complex mixtures which are held out as specifics to cure this and every other disease.

A Physician writes to the Buffalo Courier as follows:—

Little medicine should be given, as there is more danger of giving too much than not enough. By careful nursing 99 out of 100 will get along very well without internal medicine. Take away their hay and oats; feed warm bran mush and clean oat or rye straw moistened with brine. We have given our horses (and we have six all sick with the distemper) from six to eight drams of bromide of potassium two or three times a day, dissolved in a bran mash for the first two or three days while the inflammation lasts. This medicine is a powerful sedative, and as such lessens the flow of blood to the head and lungs. It has no injurious properties, is perfectly harmless. I have prescribed the bromide of potassium for two years past to break up severe colds (which is acute catarrh) of myself and family and friends, and it never failed to cure the cold effectually in from 12 to 24 hours.

It has worked well on my horses. After the nose begins to run freely, the danger is passed and by good care the horse will be soon well. Externally I used and would recommend Dr. TRASK's Magnetic Ointment to the throat, around the ears and on the forehead. This ointment contains tobacco and lobelia, and operates upon the mucous glands of the head and throat by causing an increased flow of secretion from them, at the same time by its relaxing effect removing the stricture and giving almost instant relief to the cough and breathing. Free ventilation (but avoiding draughts of air) is very important; good fresh air is very essential, therefore burning tar or anything of the kind should be avoided. If the weather is warm or clear, turn the horse out during the day.

Never Let a Horse Stand and Dry, when he comes into the stable wet with perspiration. Wash and rub him dry the first thing. It's the only safe way.

Domestic Economy.

HOW I MAKE SOFT SOAP.

I KEEP my ashes dry, and when put in the hopper prepatory to making soap, I have from a half to 1 peck of unslacked lime put in with the ashes. Before putting the grease in, I swing the kettle off the fire and let it hang a few moments. If there is any potash in it, I take a shovel and take it out. For if there is much potash in, it will not make good soap.

I pack the ashes well, adding water enough to dampen them. Then I put three or four buckets of water on each day for two or three days, until I think it sufficiently soaked. And lastly I pour on boiling water to run the lye off. As soon as I have enough run off to commence boiling, I put my kettle over the fire, and boil the lye as fast as it will boil, still adding more lye as it boils down. In this way I continue for a whole day. By evening it will probably be sufficiently strong to eat a feather in passing it three times across the liquid. I now put my grease in (all I think it will eat), still boiling as fast as I can without its running over. If it eats the grease all up I add more. I now leave my kettle to hang over the fire all night. In the morning if there are any scraps of grease that are not eaten up, I boil again for an hour or two, and if they do not dissolve I take them out. Then I take out a few spoonfuls of the soap and set it away a little while to cool. When cold, if there is no lye under it and it appears free from grease, I set my kettle off, and hang another one to boil more lye. Managing in this way, I generally can make from sixteen to eighteen gallons of nice white soap in two days, and often in one day and a night.

I think that by pursuing this plan or a similar one, any one can make strong, nice soap.—*A Farmer's Wife, in Cincinnati Gazette.*

ODDS AND ENDS.

Boiled Lettuce.—This, to our taste, is a delicious vegetable, and the *gout* is something indescribable, resembling asparagus or seakale, and yet not quite like either. Lettuces may be simply boiled and eaten as other greens, but they can be boiled and served as *entre-mets* in a variety of ways. Have ready some neatly-cut pieces of toast, a pale brown color; lay them on a dish, *a hot one*; let each piece be of a size to hold the lettuce and one poached egg; pour over the toast a little of the water and some good gravy; if the latter be not handy, a little fresh butter should be spread on the toast previous to pouring the water from the lettuce; place on each piece of toast enough of the boiled lettuce to form a flat layer; neatly trim the edges of the vegetable, and place a poached egg on the top; or, prepare some toast as above, and spread over each piece a thin layer of anchovy or bloater paste, on which lay the lettuce; then season to taste. To prepare the lettuces for boiling they should be well cleansed, and the top of the leaves, if they have the slightest appearance of fading, cut off; leave as much of the stalk as possible, cutting off the strong outer skin. The stalk is, when boiled, the most delicious part. The large cos lettuce makes the handsomest dish, but we prefer the flavor of the drumhead.—*Knife and Fork.*

Washing Compound.—The use of soda for washing linen is very injurious to the tissue and imparts to it a yellow color. In Germany and Belgium the following mixture is now extensively and beneficially used: 2 lbs. of soap are dissolved in about 5 gallons water as hot as the hand can bear it; then next is added to this fluid three large sized tablespoonfuls of liquid ammonia and one spoonful of best oil of turpentine. These fluids are incorporated rapidly by means of beating them together with a small birch broom. The linen is then soaked in this liquid for three hours, care being taken to cover the washing-tub by a closely fitting wooden cover. By this means the linen is thoroughly cleaned, saving much rubbing, time and fuel. Ammonia does affect the linen or woolen goods, and is largely used as a liquor in the North of England.

Changing Bed Linen Saturday.—Mrs BEECHER says:—Many are in the habit of changing bed-linen Saturday, to avoid what may seem like extra labor Sunday morning, in accordance with their ideas of a strict observance of the Sabbath. We cannot think this wise. It certainly does not meet our idea of that "cleanliness that is next to godliness." We think it should be a matter of principle to have everything as pure, as sweet and clean Sabbath morning as possible. All one's clothes are put on fresh, table-cloths and napkins come right from the drawer, and if these are all brought out spotless in their purity in honor of the Lord's day, why should not our beds also shine out in the whitest of linen? We think it a pleasant and appropriate way of beginning our Sabbath.

Curing Hams.—CHARLES JESSOP furnished the Maryland Ag'l Society the following recipe:—2½ lbs. saltpeter, dried and finely powdered, ½ bushel best Liverpool salt, 3 lbs. brown sugar, and ½ gallon molasses. Mix all in a vessel, rub the meat well with same, and pack with skin down.

The above is the exact amount required for 1000 lbs. of pork. After being in salt three to four weeks, take out, wash clean the pieces, dry, and hang it up for smoking. Three weeks is sufficient to smoke them thoroughly—by fire made of hickory wood. When smoked, take down and bag, or pack away in dry chaff or cut straw. Examine them occasionally, and if found to be at all damp, renew the packing with dry material.

Eating the Banana.—There is a way we have of eating them in the East which is worth knowing, thus—take a soup plate, strip half a dozen bananas, and with a silver fork mash them up, adding sufficient sherry and sugar to make the whole of about the consistency of a thick soup. When so treated there is a flavor which may almost vie with that of the most delicious fruit in the world—the Mangosteen. There is a great difference in bananas abroad; the best I remember eating were at Singapore. They were also particularly good at the Cape de Verd Isles; in China and Japan not so good, the slightly pink always preferred.—*Screw Propeller.*

How to Preserve Vegetable Marrows.—Peel the marrows, take away the seeds, cut the vegetable into small pieces. To every pound of marrow add half a pound of sifted loaf sugar, the rind and juice of a lemon, half an ounce of grated ginger. Put these into a basin and let them stand all night. The next day pour the juice into a pan and let it boil up, then add the vegetable. Boil all together an hour and a half, or until it becomes thick and transparent. If put into a mould which will not affect the acid, the preserve will look very nice when turned out for use. Most vegetables may be prepared the same way.—R.

To Detect Sulphuric Acid in Vinegar the following process is said to be effective, and is simple.—Boil a few grains of starch with an ounce or two of the suspected vinegar, for a few minutes in a glass vessel; when it has become cold, add a drop of tincture of iodine. If the vinegar contains no sulphuric acid, a beautiful blue color will be produced by the reaction of the iodine on the starch. But if a small quantity of sulphuric acid be present, no color will be developed, for the acid will have changed the starch to dextrin, which is not colored by iodine.

Cauliflower Salad.—Boil a cauliflower in salted water till tender, but not overdone; when cold, cut it up neatly in small sprigs. Beat up together three tablespoonfuls of oil and one tablespoonful of tarragon vinegar, with pepper and salt to taste; rub the dish very slightly with garlic, arrange the pieces of cauliflower on it, strew over them some capers, a little tarragon, chervil, and parsley all finely minced, and the least bit of dried thyme and marjoram, powdered. Pour the oil and vinegar over, and serve.—Y. N.

Preserving Fish with Sugar.—A method adopted in Portugal for preserving fish consists in removing the viscera and sprinkling sugar over the interior, keeping the fish in a horizontal position, so that the sugar may penetrate as much as possible. It is said that fish prepared in this way can be kept completely fresh for a long time, the flavor being as perfect as if recently caught. One tablespoonful of sugar is sufficient for a five pound fish.

Canning Corn.—Cut the corn off the cob, and boil till nearly done; then take the same amount of tomatoes, and boil the two together till done, and then can it up. In this way you can have a good dish the year round. I have tried canning corn by itself, but it would not keep.—MRS. N. A. DILLMAN.

Domestic Inquiries.—Mrs. JANE T. asks how to make good apple butter.

Pisciculture.

SALMON CULTURE.

AT a meeting of the State Commissioners in this city, Oct. 16, Prof. S. F. BAIRD, United States Commissioners of Fish and Fisheries stated that he had, in accordance with suggestions of the Commissioners of several States, at a meeting held in Boston on the 13th of June, made an arrangement with Mr. ATKINS, of Bucksport, Me., to procure for the United States a large number of eggs from the salmon of the Penobscot River. This gentleman, by the aid afforded him by the United States Commissioners, had been enabled greatly to extend the operations originally undertaken in the interest of the New England States, and now has about 600 large, healthy salmon in an enclosure staked off in the centre of a pond of 150 acres. From these fish the eggs are to be taken at the proper time; and, impregnated, the salmon themselves then to be again set free. From this source he hoped to receive several million eggs.

Wishing to increase the certainty of securing a supply of eggs, he entered into correspondence with the officers of the Deutsche Fischerei Verein in Germany, and through their influence the German Government had kindly offered to present to the United States a quarter of a million of eggs of salmon from the Rhine, on the sole condition that the United States should employ an expert to accompany the eggs to the place of shipment. This condition was gladly accepted, and subsequently a contract was made with Mr. SCHUSTER of Freiburg, for a quarter of a million more eggs of the same variety of salmon. These it is expected will be cared for and transported to the coast by Mr. RUDOLPH HEPEL, an experienced fish culturist, and it is even hoped that he may accompany the valuable cargo (which will weigh 5,000 pounds) to America. In accordance with the suggestions of the meeting at Boston it was decided to try to secure an additional supply of eggs from California, and Mr. LIVINGSTON STONE was despatched for that object early in August. He established himself on the Mount Cloud River, a tributary of the Sacramento, but contrary to the expectation derived from the most trustworthy information, found he was a little too late, the spawning season having already passed. A report by Mr. STONE of his work was read, in which he expresses the opinion that, inasmuch as he has already erected a hatching-house, and solved many of the problems which were necessary to be decided, the prospect for securing many millions of eggs next year is excellent, provided the ground be occupied as early as the 20th of July. Some 10,000 or 15,000 eggs were obtained this season, and may be expected before long.

Pacific Slope Fisheries.—Something may be learned of the extent of the commercial salmon-fishing in the Columbia river and Oregon and the Territory of Washington, from the following statement;—According to the Portland Oregonian, there were taken between April 1 and August 1, 1872, for canning purposes, 170,000 fish, weighing, when dressed, 2,700,000 pounds, making 56,250 boxes of forty-eight pounds each, and worth, at wholesale market prices, $432,000. The salmon taken for curing purposes during the same season amounted in number to 162,500, weighing, when dressed, 2,600,000 pounds, making 18,000 barrels of 200 pounds each, and worth $117,000. The total number of salmon taken on the lower Columbia river during the season of four months, amounted to 332,500, weighing 5,300,000 pounds, and worth $549,000. There are also large numbers sent to market for sale fresh.

Marking Salmon in England.—The Board of Conservators of Fisheries in some of the districts of England cause a silver label to be attached to salmon taken from certain rivers when they are replaced in the stream. Then any one taking these fish, subsequently, is requested to forward it at once to the Chairman of the Board in the same state as when taken, with full particulars of date, place of capture and weight when taken. The party sending it gets five shillings for his trouble and all expenses paid.

Fish Culture in Germany has become a very important business. The Prussian Minister of Agriculture has commissioned Dr. KNOCH of St. Petersburg to supply from the Volga 100,000 young specimens of sterlet for introduction into the rivers of Germany. In 1871-72 the breeding establishments at Hermugne, Germany, distributed in a fertilized state to the Germany, Alsace, Loraine, Holland, France, Switzerland, Austria and Italy, eggs as follows: Of common trout, 499,000; salmon trout, 748,000; great lake trout, 228,000; salmon, 1,051,000; char, 305,000; fera, 1,107,000; hybrids, 109,000; Danube salmon, 5,000; grayling, 15,000. Switzerland and France are also restocking their waters with fish.

Floricultural.

HYACINTHS IN WATER.

The cultivator of hyacinths in water should not grow large so much as medium-sized solid bulbs. What he wants is a finely-developed spike of flowers crowning a short, healthy growth. Large bulbs—especially of some varieties, such as Lord Wellington and Temple of Apollo, single reds—are very apt to throw up two, three, and even four small spikes, the size of the duplicate spikes decreasing as the number is larger. About the middle of October is the best time to place the hyacinths in glasses. The best type of glass is not unlike in appearance a wide-mouthed small decanter. Fresh water should be used, and it is a good plan to fill the glasses, and then place in each three or four pieces of charcoal, to keep the water from becoming offensive, therefore obviating the necessity for its being frequently changed. This should be done about three days before the bulbs are placed in the glasses, as in the interim the charcoal becomes thoroughly saturated with moisture and sinks to the bottom of the glass. If placed in the water at the same time as the bulbs, it will occasionally happen, in the case of strong, quick-rooting varieties, that the descending roots encircle the charcoal and keep it close under the base of the bulbs. There is no real necessity for placing the glasses in the dark to induce a free root growth. It is an old practice, but it is not the more necessary to be followed because it is old.

I have grown hyacinths in glasses with much success for the past ten years, and I have for a considerable period discontinued placing them in the dark, and that simply because it is not necessary. The theory set up is that "roots, as a rule, delight to grow in the dark, the action of light being unnatural to them." But the generality of hyacinth glasses are of an opaque character, and the newest types in Etruscan ware, etc., altogether so. If the theory be a correct one, the glasses themselves supply the conditions. When the bulbs are placed in my own glasses, they stand on the mantelpiece, the sideboard, etc., and a bulb seldom fails to root very satisfactorily, and then invariably because of some inherent defect. The roots of the hyacinths make growth first, unless it be very late when they are placed in water. In its own good time the foliage appears, and then it becomes necessary to keep the glasses in a cool, airy position, so that the leaves do not become drawn, as also to keep the glass filled with water to supply that which becomes absorbed by the roots and lost through evaporation.

When charcoal is placed in the glasses it is rarely necessary that the water be changed. I have read very elaborate but very tiresome rules relating to the culture of hyacinths in water, in which it is urged that the water be changed at least once a week. Some of my best flowers have been grown in glasses the water in which was not once changed. If a brisk fire be kept in the room where the glasses are, there will be a need for fresh water being placed in the glasses twice or thrice a week, so that no part of the roots be without water. The best position for the glasses when the bulbs begin to make upward growth is the most airy and lightest part of a sitting-room, but as far from the fire as possible. The foliage of the plants should be kept free from any deposits of dust; a small piece of damp sponge will remove these with but very little trouble. As the flower spikes are thrown up, proper supports, made on purpose and sold with the glasses, should be affixed for use. They are neat and elegant in appearance, and answer the end for which they are designed admirably. If the glasses be placed in the window when the spikes are in flower, they should be shaded from the action of the sun when bright and warm, or removed from their position for a time.

R. D.

The Apiarian.

DO BEES PREVENT FRUCTIFICATION?

In Rural New-Yorker of Oct. 5, I notice an article by "Anti-Bee Keeper," in which he asks, "Do bees prevent the fructification of seed?" He thinks they do, and says he is confident that his neighbor's bees destroyed his buckwheat crop last season. On a hill side facing Southeast, in full view, is a field of buckwheat which has, within a mile's flight, at least seventy hives of bees, and I heard the owner remark that it was covered with bees when in blossom. I saw him a few days since and asked him how his crop turned out. He replied, "About half a crop." I then asked him why he did not get a full crop. He attributed it to very dry weather when filling. I then told him about the article in question (he does not keep any bees); his reply was that he was raised on a farm, and that years ago, when there was a great many more bees in this section than now, buckwheat was a better and surer crop than now.

I deny that honey is necessary to the fructification of seed in itself. If the honey is not taken from the flower, it is lost either by evaporation or washed out by rains. Pollen is the fructifying element of flowers, and bees gather it on their legs as they pass from flower to flower in search of honey, thereby increasing or promoting the impregnation of flowers. I think there will be more perfectly developed fruit and more of it where bees visit blossoms than where they do not, and think it is to the fruit grower's interest to keep bees.

But some say they injure vineyards. The jaws of the honey bee are delicately formed for the working of wax, and are unable to puncture the skin of the most delicate grape; but when fruits are bruised or punctured by hornets or wasps, *then* the honey bee comes in for its share.

Our vines hang full of grapes now, and sound grapes are not troubled by our bees. If vineyardists would pick the poor grapes, put them in baskets and remove them from the vineyard altogether, instead of throwing them on the ground and stepping on them, I do not think they would be troubled with bees. From reports of Bee Keepers' Conventions, I judge that Mr. Hethrington of Cherry Valley, N. Y., is not only one of the most extensive bee keepers in this country, but keeps his bees where a great deal of buckwheat is grown, and I should like to have his report, as well as other prominent bee keepers and fruit growers, in the columns of the Rural, on this subject. J. E. Moore.

Rochester, Pa.

BEES AND FRUCTIFICATION.

In the Rural New-Yorker of Oct. 5 I find an article headed "Do Bees Prevent the Fructification of Seed?" signed "Anti-Bee Keeper." There is an assertion made, but not one particle of evidence is adduced to prove the affirmative. I will bring proofs to show that the contrary is correct, but will try and be brief in quoting authorities. Dr. Packard says, on the value of bees in agriculture, that by conveying the pollen from one plant to another they thus insure the complete fertilization of the seed and improve the fruit. This has been proved by the fertilization of plants by hand. All botanists agree that insects of various kinds, as well as bees, are necessary to increase the quantity and quality of seed and fruit-bearing crops, and to prevent sterility in the flower. What in nature is the use of honey? The observations of our best naturalists go to prove that it is secreted by the plant for the very purpose of attracting bees and other insects, otherwise it is of no use to the flower.

Prof. Lucas, one of the directors of the Hohenheim Institute (German) states that bees are of the utmost importance in the fructification of both fruit and seed-bearing plants. I am tempted to give one more instance. Humble bees visiting Dutch clover, 20 heads yielded 2,200 seeds; but 20 other heads, *protected from bees, produced not one.* Again, 100 heads of Red clover produced 2,700 seeds; *but the same number protected from bees produced none.* The humble bee alone visits Red clover, especially first blossoms.

Perhaps Mr. "Anti-Bee Keeper" would like some authorities on this subject, and will give the names of H. Newman, C. C. Sprengle, Gartner, Dr. Hooker, Dr. Asa Grey, and others if wanted. Perhaps if Mr. "Anti-Bee Keeper" was a little more conversant with Natural History he would not display so openly his supreme selfishness. A. M. Cook.

Jamestown, N. Y.

HONEY COMB.

There are two kinds of comb required in a hive—worker and drone; the former small and the latter large cells. It takes a great deal of time and expense to construct it. There is about two and a half pounds in a common hive, which is made of honey, on the same principle that if we feed hogs corn a certain portion of it will produce oil or fat; the same with the bees when gorged with honey for a certain length of time, a portion of it will secrete into wax, which extends from them in the form of small, white scales (extends from wax pouches on the abdomen,) which they used in constructing comb.

It is universally considered that it will require twenty pounds of honey to make one pound of comb; if so, it will require fifty pounds of honey to furnish one hive with comb; and honey at twenty-five cents per pound would be $12.50.

From this true statement, dear readers, we may judge whether it would be prudent to save and buy all the nice worker comb we can get, and fill our empty hives with it, instead of rendering it into wax and selling it at thirty cents per pound, the usual price, when it is worth $5.00 per pound to save it from the bees. No wonder the honey extractor is coming into general use by those who know the value of comb.—*National Bee Journal.*

BEE NOTES AND QUERIES.

Distribution of Honey Bees.—Honey bees are found widely distributed over the face of the earth. Prof. Kilau found them even at the most Northerly promontory of Norway. In Greenland they are able to lay up stores for nine months of Winter. In Switzerland the Pastor of Rauda has an apiary 4,160 feet above the sea. They occur in Asia and in a part of Africa. On the coast of Asia Minor apiaries are common and the Smyrna honey is highly prized. The bee was imported to America in 1675. The first mention of an apiary in the United States was that of George Pelton of Virginia, in 1816. The Melipona (*Melipona scutellavis*) of Brazil is a honey bee with no sting, but with a sharp bite.

DUTIES AFTER ELECTION.

Ere this paper reaches our readers, election will be over, and the verdict of the people in relation to the political issues of a very rabid campaign will have been recorded. There will be rejoicing and disappointment; short faces and long ones; new-born hopes as to the possibility of official place and corresponding despair of tasting the public pap the next four years; bright anticipations of further political preferment and the relinquishment of all political ambition. We shall see, speedily, the active partisans of the successful party rushing to Washington, to prefer and push their claims to reward for services rendered during the campaign. Such a wrangling will result, as can only be seen in this "enlightened Republic," and the character of the "patriotic impulses" which have impelled men to labor day and night to "save the country," will appear in naked hideousness.

Happy the man who has not become a place-seeking monomaniac; fortunate the monomaniac who, seeking, fails to obtain an office: thankful should be the man thus rescued from a life which tends to destroy self-respect, imposes servility, exacts the most humiliating service, and compels him to stand as a target for his enemies, personal or political, and receive their shots without making a sign. Let the young men who read this, whose lives on the farm seem comparatively unremunerative and burdened, remember our words. Do not throw yourselves into this maelstrom of office-seeking. Do not be ambitious to wear an official title. Do not seek any official place. Wait until the place seeks you—until you can accept the suffrages of your fellow citizens as a tribute, not as a favor. Better be forever a plodding farmer than a public pensioner and placeholder.

No matter who is to be President the next four years, the duty of every good citizen is to conform to and aid in the enforcement of the laws. If the laws are wrong, seek their correction through the elected representatives. But let no man try to evade or obstruct their execution so long as they remain laws. This is a government of the people, by the people, and for the people; and the people are responsible for all enactments, oppressive or otherwise. To shirk this responsibility is to concede that representative government is a failure; to concede it a failure, is to confess that the people are ignorant and impotent.

The self-imposed duty of recovering the loss from the waste of time and expenditure of money which a Presidential campaign involves, cannot be shirked. These losses to the industry of the country must be replaced by industry. It will be found necessary for every man to attend to his own business now. Besides, it is his duty. It is one of the royal evidences of the sovereignty of the people and of their capacity for self-government, that with the decision of a political issue by popular vote, all wrangling ceases, all strife ends, all bitterness evaporates, and all citizens, men of both parties, co-operate to render the country prosperous, progressive, and insure to it and to each other all the blessings of Peace.

HOLES AND CORNERS.

Our readers may be aware that in some localities there are what are known as Hole-and-Corner Farmers' Clubs. They are excellent institutions. But there are hole-and-corner clubs that are most vicious institutions. They are organized by the Paul Pry family, and include the whole tribe, of both sexes. The chief fault to be found with them is that they do not operate in nor confine their operations to their own holes and corners. They never see any beams in their own eyes. They invade their neighbors' fields, barns, stables and homes, and are quick to discover whatever may be criticised there; but they are as blind as bats concerning their own premises. They smell out with keenest scent any place that requires deodorizing; but instead of covering up or cleansing the filthy spot and protecting the public from it, lay it bare to the eyes and stir up the stench for the delectation of the nostrils of the whole Pry family and its near relatives.

What we want to say is that we do not solicit the acquaintance of this family. We do not invite their contributions. If there are such filthy holes and corners on your neighbor's premises, and you discover them, call his attention to them and help him to cleanse them. Then, if you please, tell us *how* it was done—what are the most efficient means for making rough places smooth and rotten places sound, and sour places sweet. Above all (and we mean this advice to apply in personal as well as general cases) look vigilantly about your own premises for these dirty or uncouth holes-and-corners. If you want to advertise anybody's, advertise *your own!* Get some of your neighbors to help you in your examination, if you choose; but don't proffer your aid, in this matter, to your neighbors.

RURAL NOTES AND QUERIES

A Timely Topic, Briefly Discussed.—Now that Election is over we beg respectfully to suggest that such journals as the Rural New-Yorker must for some time forth be in much greater demand than during the exciting political campaign just ended—that they will be wanted by level-headed men and women, and also by the rising generation, for they are among the most useful, instructive and entertaining Vehicles of Knowledge accessible to the People. Therefore we submit that—the Republic being safe, whoever may be elected President—the People should proceed with their usual and very essential avocations, in order to make money, provide for their families, educate their children, pay the National Debt, and then take things easy. We therefore further respectfully suggest—in the interest of the aforesaid People as well as of ourselves—that the Agents and other Friends of this hebdomadal bestir themselves, at this favorable season, to extend the circulation and usefulness of all journals calculated to enhance the material prosperity and best welfare of the People and Country. If the Rural New-Yorker is, in your opinion, worthy of precedence, do us and your neighbors the favor to aid its circulation in such manner as unto you seemeth right and proper; but if not, put forth efforts for the next best, and so on.

Farmers' Clubs and Granges' Convention in Illinois.—A State Convention of Farmers' Clubs and the Granges of the Patrons of Husbandry of Illinois was held at Kewanee, Oct. 16. Resolutions were adopted recommending:—1, co-operative effort among farmers, or combination; 2, recommending the multiplication of farmers' clubs and similar organization; 3, favoring the Patrons of Husbandry as an organization; 4, urging the vital importance of exterminating the Canada thistle from the prairies; 5, urging the thorough enforcement of the State Railroad law; 6, appointing a State Central Committee of one and a Committee of one from each county to act as a medium of communication between the various farmers' organizations; 7, approving the State law prohibiting persons hunting in inclosures without lease; 8, also the law in regard to the introduction of Texas and Cherokee cattle and urging its rigid enforcement. An Executive Committee, consisting of L. F. Ross, Canton, John Prickett, Lewiston, and Wm. Beem, Lee, was appointed to fill any vacancies in the State Central Committee and call the next State Convention. W. C. Flagg, Moro, Ill., was appointed State Central Committee in accordance with the foregoing resolution, and the following are the names of the County Committees so far as appointed: H. H. Gibson, Moro, Madison Co.; W. F. P. Hennesy, Aron, Fulton Co.; O. H. Loomis, Kewanee, Henry Co.; L. D. Whiting, Tiskilwa, Bureau Co.; Cyrus Humphrey, Hermon, Knox Co.; G. W. McElroy, Rantoul, Champaign Co.; Joseph Wright, Rock Falls, Whiteside Co.; Henry Saddoris, Port Byron, Rock Island Co., H. C. Lawrence, Prairie City, Warren Co. The Executive Committee will fill vacancies as Clubs report.

Foot-and-Mouth Disease in the Argentine Republic.—The Secretary of the Treasury, Oct. 30, issued the following circular to Collectors of Customs at the principal seaports:

The Department has received information that the hoof-and-mouth disease of horned cattle has again broken out in portions of the Argentine Republic, and, therefore, to prevent, if possible, its introduction into the United States, you are requested to give the necessary instructions to customs officers at your port for the careful observance of the existing regulations which prevent the importation of neat cattle or hides from a country afflicted with such disease, unless such importations are accompanied by a certificate from the United States consular officer at the port of shipment that the same are free from infection and are the product of a section of country where the disease does not exist.

Farmers' Purchasing Agents.—The testimony of farmers' organizations which have clubbed together and appointed an agent to purchase farm implements of manufacturers, groceries, dry goods, etc., at wholesale rates, thus avoiding paying local retail profits, seems to be generally favorable. In some instances, in consequence of the incompetency of the purchasing agents, entire satisfaction has not been given; but generally the experiment has succeeded. This method of co-operation, if properly guarded, and the confidence of the principals not abused by the agents, is to be commended. It is one of the most direct blows that can be given to monopolies and extortion. It is to be encouraged for this reason.

State Ornithologists.—A New York City correspondent writes, asking whether each State in the Union has a State Ornithologist, and by what law or custom they are appointed, their duties, etc. We do not know that any State in the Union has a State Ornithologist. New York, Missouri and Illinois has each a State Entomologist. The Legislatures of these States created such an office, defining the duties of the officer, who is, in each case, we believe, appointed by the Governor and the appointment confirmed by the State Senate. Their duties are to study the Insects of the State in their relations to Agriculture and report thereon to the Legislature. Several of the States have State Geologists, appointed in the same manner.

United States and Foreign Cattle Disease.—The United States Treasury Department has instructed its custom house agents at all the entry ports of the United States, to prevent the importation of cattle and hides, unless accompanied by a consular certificate from the port whence shipped, that they are free from infection and the product of a district where the disease does not exist. These precautions apply to all parts of Russia, Great Britain and Germany. There is great need of such precautions.

Premium Lists Received.—Of the Nashua Union Ag. Ass'n; Fair at Nashua, Iowa, Oct. 8-10....Of the Ag. & Mech. Ass'n of West Alabama; Fair at Eutaw, Ala., commencing Oct. 22d....Of the West Tennessee Ag. and Mech. Ass'n; Fair at Jackson, Oct. 22-26.

Bombay Agriculture.—It is asserted that an Agricultural Society has been started in Bombay, to diffuse useful knowledge among the ryots by means of vernacular publications and, if convenient, by founding agricultural schools.

THE SEASON. CROPS, PRICES, ETC.

Clifton, New Mexico, Oct. 25.—Hops of fine quality grow in great abundance in New Mexico. Currants of large size, fine quality, and four colors, grow spontaneously and in great abundance; also plums, raspberries, strawberries and cherries. Flax that bears black seed grows 4 or 5 feet high. It rained here in May, 12 days; in June, 18; in July, 28; in August, 14; in September, 5; and in October not at all. No more rain is expected until April or May. Crops fine. Excellent water power here. A vast amount of wool invites manufacturers of woollen goods.—S. D. S.

BUSINESS INFORMATION.

The Root Safety Boiler.—One of the safest, most economical and convenient boilers in all respects, yet invented, rendering it of especial value to farmers, miners, manufacturers, and all who need the use of steam power, is the Root Wrought Iron Sectional Safety Boiler. If the reader will turn to the advertisement on another page, he will find it asserted that this boiler is absolutely safe; that whether small or large it is of uniform strength; is easily repaired and set up; can be transported to any place without difficulty, and generates as much steam per pound of coal as any boiler yet invented. This boiler may be easily enlarged, or reduced in size, while the moderate price asked for it places it within the reach of all. All portions of these boilers are made up to a certain standard, and a stock is constantly kept on hand so that they can be furnished to order, from five horse-power upwards, to any power desired. Thus the manufacture is systematized, and it is claimed a better boiler can be given for a less price than at a jobbing establishment. They can be enlarged, or portions for repairs can be obtained at short notice. From 16,000 to 20,000 horse-power of these boilers are in use in this country, and about the same amount in England, where they have been applied for marine purposes in large steamships. For heating houses with steam they are well adapted, since they require no special intelligence to set them up or run them.

The Goux System of Utilizing Fertilizers, described some time ago in an article in the Rural, is gradually growing in favor with the public, as it is sure to do wherever it becomes known. The establishment in New York city has taken larger quarters at the corner of Canal, Vestry and Varick Sts. All farmers, and those interested in agriculture should give the house a call, and see for themselves how useful and practical the system is. An improvement has been made in the patent absorbent closets designed for houses, which dispenses with all mechanical appliances for the use of disinfectants. Closets can now be had for from $10 to $20, and will be looked after by the company for 25 cts. a week. The company is now receiving from 1,500 to 2,000 pounds of fertilizers a week, which is prepared and sold in barrels at the rate of $50 per ton. Every farmer ought to know nothing he can use equals the preparations made from human offal. As a matter of health and purity of atmosphere, every school, hotel, depot and public institution, as well as private houses, should adopt this or some similar system of deodorizers. The Goux Fertilizing and Sanitary Company are attempting a great work in educating our people up to better knowledge concerning the use and value of human excrement.

RURAL BREVITIES.

"An Earnest Reader" is informed that we do not know anything of the "hair coloring" named.

There is a dog law and dog tax in Virginia—the income from the tax going to the public school fund. This answers "P. R. N."

Utah is reported as raising 1,000,000 bushels of wheat, surplus, the past season, which has been sold in St. Louis at remunerative prices.

Miss Hessie G. Marshall, Colebrook, N. H., is reported to have picked a dish of field strawberries, Sept. 30, one of which measured 2½ inches around.

It is asserted that at the close of the present year there will be 100 Granges and 10,000 Patrons of Husbandry in Minnesota, and that there are 600 Granges and 80,000 members in Iowa.

Charles Downing, the veteran pomologist, continues to show his face and exert his influence wherever fruits are shown and horticulturists meet. He called upon us, the other day, on his way to attend the Exhibition of the oldest Horticultural Society in the Union—that of Pennsylvania, at Philadelphia.

PUBLISHER'S NOTICES.

TO EVERY READER!

HINTS, REQUESTS, SUGGESTIONS, ETC.

The Premium Picture is sent to All who pay $2.50 for a copy of the Rural one year, and *not to those who only pay the club rate.* Club subscribers can secure the Engraving, however, by adding 50 cts. to the usual club price ($2.) Don't forget this.

Our Premium List was published in last number (page 271,) but we will send copies in other form, together with Show-Bills, Supplements, Specimen Numbers, &c., free to all actual or intending Club Agents desiring such documents for canvassing.

Begin Clubs Now!—And to all who want the paper from date, or either one year (at $2.50) or 15 months (at $3) from Oct. 1, we will send the paper accordingly, with Premium Engraving post-paid. The whole club can start at one time, or part Jan. 1st and part earlier. Note this fact.

The Campaign Opened!—Many Agents have already opened the Rural Campaign for 1873, while hosts are sending for Specimens, &c., probably with the view of starting on Election Day (a good time, by the way,) or soon after. All right, friends!—That's the way to win Premiums easy.

Attention, Officers of the Rural Brigade!—All Rural Recruiters are Richly Rewarded—vide offer to Club Agents—and there is "ample room and verge enough" for thousands of new recruiters (club agents) to aid in swelling the ranks of the good old Rural Brigade. Our bounties to both officers (Agents) and privates (Subscribers) are most liberal—for every one of the former who gets up a club receives a Valuable Premium, and each of the latter a $5 Picture! Recruiting and Enlisting Papers sent free to all applicants. Why not send for them at once and open the Campaign?

BUSINESS NOTICES.

HORSE EPIDEMIC.

A physician in a communication to a Buffalo paper about the Horse Epidemic, says:—"Externally I used and would recommend Dr. Trask's Magnetic Ointment to the throat, around the ears and on the forehead. This ointment contains tobacco and lobelia, and operates upon the mucous glands of the head and throat by causing an increased flow of secretion from them, at the same time by its relaxing effect removing the stricture and giving almost instant relief to the cough and breathing." It is kept by all Druggists.

The Traveler.

OUR EUROPEAN LETTER.

Arrival in Paris.

PARIS, Oct. 8, 1872.

I HAVE delayed this letter a week, hoping to experience a thrill of enthusiasm of sufficient intensity to tinge my pen with something of the rose color through which most people see Paris, at least when aided by the enchantment of distance. But I despair of attaining to such felicity, and beg the dear RURAL friends, sitting happily by their shining firesides, to be with me content to see only the sober, but substantial gray of existence, and to be thankful each day anew for having been born in America. For the last six weeks I have been in that especial mood of thanksgiving. Upon arriving in Paris, we stepped out of the car compartment, for "women only," in which we had journeyed, and were shown into a large waiting-room, where we were told to wait. All sorts and classes of people were walking up and down in restless moods. At the end of half an hour a large door swung open, and there was a general rush for the next room, where the travelers' trunks were arranged on counters, with regard to the cities from which they had been checked. In France all trunks are weighed—extra weight, that above 66 lbs., paid for; but to obtain a check for any weight a trifle must be paid. The only comfort I have yet experienced with baggage, is that it is handled with a degree of respect and reverence unknown to an American porter.

Upon leaving the depot we were at once driven to our destination, a large boarding-house or hotel, which we found to be cosmopolitan to a remarkable degree. The landlord himself is an Italian; his wife a Parisienne, while the guests in the house include men and women from Russia, Roumania, Spain, Greece, Isle of Java, Bahamian Isles, England, Germany, Austria, and almost any number of Americans. Nearly all speak French, and nearly all the French speak English. To hear them chattering in the *salon* after dinner, while taking their coffee, reminds one of the confusion of tongues, which, alas! entailed a great deal of vexation on the race.

The Expense of Living in Paris

ranges from twelve to twenty dollars a week, exclusive of fire and lights, and including simply a fair degree of comfort, without any of the luxuries. Lessons in French can be had from two to five francs (a franc is equal to 20 cents) per hour. Gas in apartments is almost unknown, the orthodox light being the feeble rays shed abroad by a pair of wax candles. The French broom bears no relation whatever to its American relative, being a large brush, in the shape of a clothes brush, with a long handle. Men do the chamber work; consequently, it is very well done. There is little or no reliance whatever to be placed upon the word of the working classes or shop-keepers. They tell you, with the most honest face imaginable, that they will serve you so-and-so, but I have yet to learn of one who has kept his word. Finished boots, dresses or hats are sent home on Sunday, the same as on Monday. The upper classes are scarcely expected to be visible before noon, and the shop-keepers are never fully in order with their wares before that hour. Only a few shops in Paris have fixed prices for goods, while at the others the shop-keepers commonly ask you double the price they will actually receive, if you refuse to buy, which is very annoying to a person who has a distaste for "driving sharp bargains."

Snails as Food.

Among the peculiar articles of food popular with the French are snails—called colimaeon. They are found in abundance in gardens, clinging to shrubbery and vegetables. When prepared for eating, the mouth of the shell is filled up with a stuffing of bread, parsley, etc., and then baked. They are said to be very nutritious, and an English lady tells me they are prepared and preserved in a certain form for a diet for consumptives, and frequently prescribed by English doctors. As yet, I have not been conscious of eating anything more pronounced than frog and stag, although daily expecting to discover that I have dined on horse, as meats are fixed up in a fashion that almost completely disguises their origin.

Food Items.

Game of all kinds is not cooked until it has approached a state of ripeness that is startling to an American. White grapes are those most generally eaten, but the wine almost universally drank is red, being considered more wholesome than the white. Beans, white and green, form a standard dinner dish. Chicory is more commonly used for salads than lettuce, which here is called Roman salad. The head of the chicory is tied up in a bunch while still in the garden, until the inside becomes fully blanched. Another vegetable, the name of which I forget, ranks quite the same as cauliflower. It is the fac simile of cabbage, in miniature, the heads being no larger than a small hickory nut in its shell. The French eat tomatoes only when cooked, looking upon those who eat them raw with much the same horror as we would regard a cannibal. Champignons (mushrooms) are much used to flavor meat sauces, and confitures, in which the French excel, and line their shop windows with to a most tempting degree, are eaten in very dainty quantities. French bread is delicious—white, superfine, light—but ruinous to feeble stomachs. Pitchers containing water for drinking purposes are never seen on the table or toilette stand. Their substitute is a wide-mouthed glass vessel more like a vase than bottle in shape, and having no handle save its neck. The sheets of a French bed are double the size of our own, the lower one being rolled to almost half its length around the bolster and the upper one folding over the coverlid almost to the foot of the bed. Sheets and pillow cases of linen only are used. Double beds are unusual—a custom most happily growing into American favor, now that our pioneer days are over which necessitated the economy of double beds, to the sacrifice of decent privacy and comfort. So much for a few national peculiarities.

Architecturally,

Paris is very monotonous. The buildings are mostly a light gray limestone, soft when quarried, but becoming hardened upon exposure. Seven and eight floors high is the ordinary hight, the roofs being peaked, covered with slate and rendered somewhat picturesque with dormer-windows and groups of iron smoke stacks rising from the tall brick chimneys. The boulevards, lined with trees, are as smooth to ride over as a parlor floor, and the sidewalks are as wide as those of Pennsylvania Avenue in Washington.

The city abounds in open spaces ornamented with statuary, fountains and benches for such as care to sit. At these places are found omnibus offices, where you obtain a ticket with a number upon it, entitling you to a seat in the next omnibus, in case there is room. If your ticket bears the figure one, you have the first chance; if four, the fourth chance; and one can only get in and alight from the omnibus offices, which arrangement is declared a nuisance by all eager Americans. It insures equal rights and equal wrongs, which is the best to be said in its defense.

The Central Park of Paris

Is the Bois de Boulogne. During the Franco-Prussian war, many of the trees were cut down, which impaired the beauty of the Park. It contains two or three very pretty artificial lakes, some charming flower gardens with colors arranged and marked for the best effect, and splendid avenues thronged with carriages and horseback riders in the pleasant afternoons. At intervals of distance are open structures, with roofs thatched with straw, under which the fair equestriennes seek shelter from the rain. I rode there one sunny afternoon with some American friends who have long resided in Paris, and on our return to their home, they showed me the injuries done their house by bursting shells. As we stood in the balcony, overlooking the loveliest avenue and view in all Paris, with the sun gilding the scene to an almost celestial radiance, and the air so full of peace and quiet, it seemed difficult to imagine that anything so ugly and infernal as war had ever been.

One of the "Sights" of Paris,

which once was very common, but of late exceedingly difficult to see, are the Catacombs. But a titled friend, with a name long and imposing as a member of a royal family, obtained permission to make the ghastly journey, and so we went, in a modest party of twenty. The street leading to the building, out of which we made the descent, is named the Street of Hell (*Rue d'Enfer*), and the door which opens into the descent has an equally dubious name. We went supplied with candles like wise virgins, although finding at the entrance numerous people eager to supply us with a *bougie* stuck in a circular piece of pasteboard. Lighting our candles we began by descending a narrow spiral stair of stone—cold, dark and frightful. Everybody quite despaired of ever reaching the bottom, and one poor dame, when half-way down, entirely yielded to prostration, and declared she could neither return nor proceed. Finally we reached the *terra firma* of this subterranean world. We threaded a long and narrow passage, until we came into a larger space, from which streets diverged at right angles, and were named such and such avenues. These were lined on both sides to the top with human bones, arranged in the most perfect order; rows of skulls alternated with the long bones of the arms and legs. Now and then the monotony would be relieved with a skull and cross-bones, or a chapel bearing some doleful or hopeful inscription pertaining to mortality or immortality. Back of these well arranged fronts the bones were thrown in to the depth of several feet. For an hour we traversed street after street, seeing only those relics of the dead and noting the skulls which have been broken by bullets or opened by bayonets. In some places the earth beneath our feet was wet, while dampness overhead seemed to be oozing out of the stones. The air, however, was not in the slightest degree unpleasant. Why such a place should be in existence seems strange in any view. The origin of the Catacombs resulted from the quarries, from which the building stone of Paris was taken. After a time, that portion of the city under which the excavations were made threatened to give way, and arches were accordingly built to support it. During some one of the reigns of terror which have afflicted Paris, hundreds of bodies were thrown into these caverns, and subsequently the bones from cemeteries were removed there, until the place became a consecrated place for dead men's and dead women's bones. Our visit threatened to prove entirely uneventful, when a splendid-eyed Greek shouted "a man lost!" whereupon a French "Count" (alas! that our party should have been so questionable!) tragically exclaimed, "Is this I? am I here?" and our one meager surprise ended in a faint laugh. We all reached the surface of the earth alive clothed and in our right minds.

THE HORSE EPIDEMIC.—ROUGH ON JONES.

JONES.—Good gracious, EMMA—I, I, guess my horse is going to be attacked with that dreadful distemper, and I am really afraid I shall catch it.
EMMA.—Not a bit of danger of your catching it, because I never heard of a Donkey having it.

Fashions.

I cannot close this disjointed letter without a thought of thousands of RURAL girls discussing the wardrobe question in these, to you, brilliant October days—to us, in Paris, damp, cloudy days. French fashions are summed up in a very few words—every thing in black, for the street, except color in the neck-tie and gloves. Skirts clear the ground, are trimmed high with ruffles or flounces. The polonaise is long, open down the front, and strapped across with passementerie cord and buttons; the back is full and looped. With a black petticoat the toilet is varied by the addition of a polonaise in any one of the numerous shades of brown or gray, elaborately braided with cord of the same shade. Dresses are made very high at the neck; the linen collar is upright, with tiny points turned down in front. Neck-ties and bows for the hair are largely in two colors; scarlet velvet with pale salmon silk; herron (very dark blue) with pale greenish blue; prune color with pale sage green; rose velvet and rose silk; crinoline is almost entirely discarded. Hair is dressed in a hundred ways; low down on the back, loosely in a net with a coronet roll or braid; high on the back with enough curls and puffs to daze a simple eye; the "French twist," surrounded by a braid, or the braid without the twist, and pretty heads look well with the hair shirted at the back and looped school-girl fashion. For a wrap the sacque and cape continues to be fashionable; a more novel style is a partially fitting sacque with immense flowing sleeves, and the garniture, fringe and braiding.

French women, for themselves, do not seem to ape after new fashions. If a garment is pretty and becoming, they do not remodel it six months after because a new style manifests itself. But to satisfy the ambition of Russians and Americans, they use their brains to invent all sorts of novelties in dress, selling them cloaks and dresses and bonnets which they themselves would never think of wearing—and for the street, a respectable French woman never makes anything but a simple, natural toilet. A section of Broadway with its magnificently attired women on promenade would drive Paris frantic with wonder. Although a blackbird myself, I confess to a weakness for tropical hues, and like Broadway.

If the transient Americans one most frequently encounters in Paris are fair specimens of my countrymen, I can readily understand why they have obtained the epithet of "Those dreadful Americans."

MARY A. E. WAGER.

SONG.

O, MOONLIGHT deep and tender,
A year and more agone,
Your mist of golden splendor
Round my betrothal shone!

O, elm leaves dark and dewy,
The very same ye seem,
The low wind trembles through ye,
Ye murmur in my dream.

O, river, dim with distance,
Flow thus forever by,
A part of my existence
Within your heart doth lie!

O, stars, ye saw our meeting,
Two beings and one soul,
Two hearts so madly beating
To mingle and be whole.

O, happy night, deliver
Her kisses back to me,
Or keep them all, and give her
A blissful dream of me.

[*J. R. Lowell.*

Our Story-Teller.

LOU'S BALLOON.

I WAS sitting quietly in my room one morning, when a note from my old friend, Lou Livermore, was brought in. I am very fond of Lou, as, indeed, all her friends are; though she still remains, like Holmes's aunt,—

"The sole ungathered rose
On her ancestral tree."

She lives far up in the country, but occasionally comes to Boston on a visit. Her note was as follows:—

DEAR HEPSY,—Here I am in the Hub at the west end of it: is that the hubbiest part, I wonder? I am coming over to see you on Thursday. I meant to go to-day; but I can't; I'm all used up,—"clear tuckered out," as Aunt Polly used to say. "What has done it?" Why, my new dress; and such a dress! It will give you fits to see how my back is hutched up and puffed out. I'm a regular balloon; a fashion-plate; a anything that is huge and hideous,—a camel or dromedary, for example: only they, poor things! were born with humps on their backs, and I wasn't. "How came I so deformed?" In an evil hour I listened to the voice of the tempter, and put myself into the hands of a city dressmaker.

"She's very stylish," quoth the tempter.

Little recked I in my ignorance what that meant; and I went to her rooms in sweet, confiding simplicity, bearing in an innocent-looking dress pattern under my arm. I had three *seances* with Mrs. Cuttit, a most imposing personage, of whom I stood in mortal terror; and at length emerged, transformed. I went in slim; I came out stout; I went in erect; I came out humph-backed: I went in plain; I came out bedizened; I went in with forty dollars in my purse; I came out with just enough to pay my fare home on the street-car,—the collapse having been transferred from my person to my purse with incredible celerity and ease.

Verily, fashion "doth make cowards of us all;" yea, and puff-balls also! I wish I had the courage to go through the world in a gored gown without a pinch or puff or pucker on it; but I haven't: so I am a balloon, that by some incomprehensible machinery is raised into mountainous ridges. Surmounting these ridges, at right angles to my body—if there be a body inside this corrugated globe, of which I am in serious doubt, to say nothing of an immortal soul—projects a fan-shaped, be-fringed, be-puckered basque, looking, for all the world, like a spread turkey-tail. On the top of this projection a good-sized trunk could be comfortably seated; only it might fall in! I wonder if a pappoose couldn't be inserted somewhere: I do so long to blend the useful with the ornamental!

Now, Hepsibah, you are a sensible married woman, competent to give good advice; and I ask you, what am I to do? Go round the world in this harlequin guise, or give the whole thing a great smash! I should be glad to preserve a modicum of self-respect; but how can I, inside of a balloon?

I shall appear in full spread on Thursday to spend the day. I can't sit down; but I *should* like the loan of a bed-post and a cord: I might go up, you know. Till then, in every fibre of my stiffening,

Yours truly, THE GREAT EXPANDED.

I sat laughing over this; when in walked Hester Graywood, another old friend. After the first salutation, she slowly twirled herself round, and sank into a chair exclaiming:

"Behold the woman who dares!"

Ah! I saw: she, too, had on a new dress. It was of silvery-gray silk, made with one skirt, without a particle of trimming on it, and a sacque just bound with a bias fold of the same. Yes, she had dared. It was really a refreshing sight; and she looked perfectly bewitching in the quaker-like costume. But, then, Hester Graywood is such a pretty little creature, she can't help looking lovely in any thing; and she knows it, so it does not require so great courage in her to dare. Yes, she looked charming. Yet, on a second glance, there seemed a kind of bareness about her, as if something were wanting. Was this because I had looked so long on mountains of frippery that my eye and taste had both become corrupted? Ten years ago we all wore such plain, single skirts, and considered ourselves elegantly dressed: why should they look mean and skimpy now?

I read Lou's note to Hester, and she promised to join us at dinner on Thursday.

"Extremes should meet," she said.

She staid on awhile, and we had a little talk on dress, and the bondage fashion imposes; or how the taste of the community is corrupted by the overloaded, ungraceful styles in vogue now, and on many other things, such as sensible women do talk about when they get together.

"One of the greatest evils of this absurd overloading," said Hester, "is that it so fearfully overworks women. We hear a great deal about the hardships of the poor shirt-makers in our cities; and they are to be pitied, I know. But there are other women to be pitied too. Look, for example, at my neighbor, Mrs. T. She is a fair representative of a large class, and not an exaggerated case. Her husband is a hard-working mechanic, who earns a good living, and ought to lay up something for a wet day; but he can't support a wife and six children in luxury, especially as four of them are girls. Mrs. T. is an ambitious woman, and says she will have her children 'decently dressed:' that means fashionably dressed. She can't afford to hire her sewing done; so, in addition to all her housework, she makes their dresses; and if you have seen Gracie, the eldest one, you can judge what that implies."

"She's a very stylish-looking girl," I said.

"Yes; and her mother is very proud of her, as is natural. She is just seventeen; and what wonderful costumes she does bloom out in! They are all afloat with puffs and ruffles, quills and frills, till there's scarce an inch of untrimmed space about her. And Clara and Nellie go by to school every morning, each with another set of furbelowed upper skirts and under skirts, basques and sacks, while baby Belle—bless her dear little heart!—is all afloat, too, with tiny ruffles on her tiny skirt."

"Isn't she a darling?" I cried.

"Yes, lovely, with her blue eyes and apple-blossom cheeks; but wouldn't she be just as pretty in a plain white dress with a bit of edging round the neck and sleeves, if it were the fashion? And the pretty Gracie—is the charm in her, her lovely complexion and fine expression, or in her furbelows and fringes?"

"In her, of course," I said. "Children and young girls are never so pleasing as when simply dressed."

"Certainly; and our taste is corrupted when we do not see this. But there's poor Mrs. T. thinks it's absolutely necessary to follow the last fashion-plate: so she works like a slave from morning till night and her sewing-machine is often going till after midnight. No wonder she looks broken down, and has neuralgia and a diseased spine. She has done the work of two women, and it is the hardest kind of work too. Every inch of all those interminable yards of hemming and binding, gathering and fastening, passes through her fingers, to say nothing of the contriving and fitting, and basting and ripping. I wonder the woman is alive. I don't believe there is a sewing-woman in the city harder worked."

"But why don't the daughters help her?"

"Those in school haven't any time. Gracie does all she can; but with her calls and callers, practising and picnicking, croquetting and coquetting, it would be cruel to expect her to do more than make the plainest portion of her under-clothes."

"But it's absurd," I said, "for a mechanic's wife to go into such extravagance."

"I don't know as a mechanic's wife can be expected to be more sensible than other women," said Hester dryly. "A reform must begin somewhere else, I fancy."

"I suppose so," I said with a sigh; but the whole subject is full of difficulties."

"All of which might be overcome if women had a spark of independence. Here is a tangible evil for them to grapple with, now that they have waked up to a sense of their strength and capabilities."

"Yes; they may as well begin a reform here, as of the nation at the ballot-box," I said, laughing. "But how to do it is the question. Is there any standard by which dress can be judged and regulated?"

"Not now," said Hester; "but I believe the principles of art, true art, might be applied to dress as to other things; that there is an essential, intrinsic beauty or ugliness in our garments, entirely irrespective of fashion; in other words, that it is one thing to be well dressed, and another to be fashionably dressed."

"Yes," I said; "but what is it to be well dressed?"

"I can tell you what it isn't," said Hester. "It isn't to wear a huge protuberance on your head or your back, which, if you had been born with it, would have been considered a shocking deformity. It isn't to conceal all the lines of the human figure, or to make it one mountain of trimming, when trimming should always be subservient, adding grace, and defining outlines. And then, too, it must be something permanent. It can't be the changing thing fashionable dressing is. Art wouldn't make a balloon of us this month, and a scantily-draped statue the next: she wouldn't tilt us up on heels that agonize our toes, and pitch us down stairs to-day, and to-morrow set us on the ground like so many flat-footed Indians."

"That would be comfort," I said. "If, when a dress was made, it would stay made, and look well till it was worn out, it would lessen half our labors."

"Well, Hepsy, I believe the good time is coming—the time when we shall have a higher civilization, and break the chains fashion fetters us with now. Then we shall distinguish between true beauty and deformity: and our milliners and dressmakers will be *artistes*, and not *modistes*; and, instead of lopping and stretching us all on one iron bed, they will study adaptation to age, complexion, and character, till we come out of their hands individual, as well as comfortable and attractive. When we think of it, isn't it strange how it ever came about that we let ourselves all be worried into exactly the same shaped garments, no matter how different we are in size and figure?"

"Very strange and absurd," I said; and Hester went away.

Exactly at one o'clock on Thursday the Great Expanded arrived. She was a good deal puffed out truly, and made all manner of fun of herself. When Hester Graywood came in, wearing her untrimmed gray silk, she made a low obeisance.

"I do thee homage, thou most heroic of womankind!" she cried. "I cast myself in the dust at thy feet, I envy, I adore thee, thou woman who dares!"

Finally we got a little quieted; though, naturally enough, our thoughts still ran on dress.

"I am disgusted with myself," said Lou; "I really am. I don't want to be fashionable; I couldn't afford it if I did: but my tastes are all plain and simple. I consider such an overloaded, puffed-out concern as this not only ridiculous, but vulgar: yet here I am wearing it; and I lose my self-respect in consequence. But how could I help myself? How in the world did you manage, Hester, to get a sensible dress made?"

"Just by my horribly obstinate temper," said Hester, laughing. "First I had a pitched battle with Mrs. Cuttit, and came off victorious; then I ran the gantlet of her twenty sewing-girls, who opened all their forty eyes in holy horror at the trying on."

"I should as soon think of fighting Hercules," said Lou. "There's no place where I am so thoroughly cowed as in dressmakers' rooms, I don't dare to peep or mutter."

"Yes;—amiable people like you rather submit than make a fuss."

"But they ought to make a fuss," said Lou; "it's sheer cowardice in my case, not amiability. Every lady's dress should be an expression of her own individual taste and character:—but look at us! we are all turned out just alike, like so many ninepins."

"Well, what is to be done about it?" I asked.

"Why not form an anti-fashion society," said Hester, "and get all sensible women to pledge themselves to dress according to their own ideas of propriety, without regard to fashion? 'Union is strength,' and organized effort the order of the day."

"Capital!" cried Lou:—"we'll draft and sign a declaration of independence; and you, Hester, shall put down your name with a great dash, John Hancock-like."

"I'll make out the list of grievances," said I.

"Easy enough to do that," said Lou; "worn-out mothers, bankrupted fathers, neglected babies, disgusted husbands"

"Hold there!" I cried. "Husbands are as fond of dress as wives, so far as my experience goes."

"Why do they keep up such an everlasting fault-finding with our extravagance, then?"

"Well, my dear, men are not always severely consistent—they are eloquent on that theme, I know; but put a plainly-dressed girl on one side of a man, and a fluttering piece of millinery on the other, and ten to one he will be enchanted with the latter. John Seymour is not the only victim of 'pink and white tyranny.'"

"Then men are in a measure responsible for the evil," said Hester.

"So I tell Tom," I said. "Let every man who approves of simplicity and economy devote himself to the plainest-dressed girl in the room, turning a cold shoulder on those who wear diamonds and such like sinful things, and he will do more to effect a reformation than by years of preaching. Girls like to please nice young men, and no harm done either, just as young men like to please nice young girls. The influence is mutual and wholesome. Let young men frown on extravagantly-dressed young women, and young women scorn all dissipated, fast young men, and a vital change in manners and morals would soon follow."

At this point in our discussion I heard Tom's step in the hall; and with him came Prof. Downing, an old friend of his, whom he had asked to dine with us. The professor is a fine-looking man, besides being learned, agreeable, and a bachelor. Now, Tom and I never make matches; but, having had such a good time together ourselves, we do sometimes wish certain of our friends would take a fancy to each other: and the night before we had spoken of the professor and Hester, saying how nice it was he should happen to be in the city just then to meet her.

Moreover, knowing his refined, almost severe taste, and his dislike of all display, I had all the morning inwardly chuckled over Hester's untrimmed dress: it was so exactly the thing to suit his fastidious taste. How lucky it was she wore it!

The dinner passed off delightfully. Tom was in his most hospitable mood; Lou and Hester brilliant; the professor genial; and, the soups, salmon, and roast lamb, all being done to a turn, the hostess serene. The learned professor and the pretty Hester could not have come together under more auspicious influences; and Tom and I had great complacency in our little plan.

A few days after, Tom told me he had been drawing the professor out a little on our guests.

"And what did he say of Hester?" I asked eagerly.

"He said this: 'Miss Graywood is certainly quite pretty; but what a pity it is she doesn't dress better! Your friend, Miss Livermore, sets her a good example there.'"

"The horrid man! and he pretending to have classic tastes!" I cried. And (will you believe it?) Tom and I are now both quite sure that the professor, who detests fashion and frippery, who admires only "chaste designs" and "classic outlines," is actually in love with Lou. And the balloon did it!—yes, the balloon did it!

Oh, the consistency of men!—*Old and New for November.*

Sabbath Reading.

THE PUREST PEARL.

FROM THE GERMAN.

BESIDE the church door, a-weary and lone,
A blind woman sat on the cold door stone;
The wind was bitter, the snow fell fast,
And a mocking voice in the fitful blast
Seemed ever to echo her moaning cry,
As she begged her alms of the passers-by:
"Have pity on me, have pity, I pray;
My back is bent and my hair is gray."

The bells were ringing the hour of prayer,
And many good people were gathered there,
But covered with furs and mantles warm,
They hurried past through the wintry storm.

Some were hoping their souls to save,
And some were thinking of death and the grave,
And, alas! they had no time to heed
The poor soul asking for charity's meed.
And some were blooming with beauty's grace,
But closely muffled in veils of lace:
They saw not the sorrow and heard not the moan
Of her who sat on the cold door stone.

At last came one of a noble name,
By the city counted the wealthiest dame,
And the pearls that o'er her neck were strung
She proudly there to the beggar flung.

Then followed a maiden young and fair,
Adorned with clusters of golden hair;
But her dress was thin, and scanty, and worn,
Not even the beggar seemed more forlorn.
With a tearful look, and a pitying sigh,
She whispered soft, "No jewels have I—
But I give you my prayers, good friend," said she,
"And surely I know God listens to me."

On the poor white hand, so shrunken and small,
The blind woman felt a tear-drop fall,
Then kissed it and said to the weeping girl,
"It is you who have given the purest pearl."

BIBLE TREES.—THE ALMOND.

As our knowledge and love for the gospel increases, so everything connected with the Holy Land becomes more pleasing and interesting. Its lofty mountains; the hillsides where terraces reached to the very top; the valleys and dales; its flowers rich and fragrant, of which CHRIST said that SOLOMON, in all his glory, was not arrayed like one of them; its trees, rivers, lakes and pools—all have been, and are, and ever will remain during all time, precious objects of interest to the Christian. To the unbeliever, one that does not love CHRIST, there is less of this veneration—less of a charm and beauty. For it was the Redeemer that made this land and all things connected with it sacred. Here he walked, talked, worked, suffered and died. Here it was that he said—"The foxes have holes, the birds of the air have nests, yet the son of man hath not where to lay his head." It may be that trees still exist where over 1800 years ago JESUS performed deeds of love and mercy; under the shade of which he sought to lead wandering hearts from darkness into the marvelous light of the gospel. Therefore, if we except the mountains, there is nothing that touches the Christian heart with tenderer, stronger interest than the different trees so frequently alluded to in the Bible.

Suppose you had retired, dear children, some cold night last January. All around your home the earth was thickly wrapped in its mantle of snow. The trees were tossing their weird-like limbs in the keen frosty air, which shrieked and moaned around the house. On awakening in the morning, all this had changed to a scene surprising as it was pleasing and beautiful. You were in the Holy Land—in Palestine; before and around you were leafless Almond trees, covered with white blossoms, which made the trees appear almost snowy in beauty and purity from the absence of foliage. By the Jews it is regarded as a welcome harbinger of Spring; their Winter is passing away, buds and flowers are coming, the voice of the turtle will soon be heard in the land. The Almond tree greatly resembles the Peach tree in leaves and flowers, only it grows a little larger. It blossoms in January when other trees are locked in Winter repose, and in March has fruit, when other trees only begin to bud. The covering of the Almond is downy and succulent, and incloses the hard shell which contains the kernel. Its Hebrew name signifies a watcher. It is also, from its early blossoming, symbolical of promptitude.

To this there is an allusion in JEREMIAH, chapter 1st, 11th and 12th verses. It is also mentioned a long period previous to this, when ISRAEL sent his sons the second time into Egypt to obtain food. Among the presents sent to JOSEPH, almonds were included. Again they are alluded to in EXODUS, 25th chapter, 33d and 34th verses; then 37th chapter, 19th and 20th verses; Numbers, 17th chapter, 8th verse. And the last time in ECCLESIASTES, 12th chapter, 5th verse. Here the Almond tree is most beautifully compared to the hoary head, on account of its Winter blossoming and the whiteness of its flowers. This tree has always been regarded by the Jews with reverence, and even to this day the modern English Jews, on their great feast days, carry a bough of flowering Almond to the Synagogue just as the Jews of olden times used to present Palm tree branches in the Temple. The Almond tree is a native of Asia and North Africa, but is now cultivated in the milder portions of Europe. MRS. M. L. BRADLEY.

Ladies' Port-Folio.

SONGS OF SEVEN.

Seven Times Three.—Love.

I LEANED out of window; I smelt the white clover;
Dark, dark was the garden; I saw not the gate;
"Now if there be footsteps, he comes, my one lover—
Hush, nightingale, hush! O, sweet nightingale, wait
Till I listen and hear
If a step draweth near,
For my love he is late!

"The skies in the darkness stoop nearer and nearer;
A cluster of stars hangs like fruit in the tree;
The fall of the water comes sweeter, comes clearer.
To what art thou listening, and what dost thou see?
Let the star-clusters glow;
Let the sweet waters flow,
And cross quickly to me.

"You night-moths that hover where honey brims over
From sycamore blossoms, or settle or sleep;
You glow-worms, shine out, and the pathway discover
To him that comes darkling along the rough steep.
Ah, my sailor, make haste,
For the time runs to waste,
And my love lieth deep—

"Too deep for swift telling: and yet, my one lover,
I've conned thee an answer; it waits thee to-night."
By the sycamore passed he, and through the white clover,
Then all the sweet speech I had fashioned took flight;
But I'll love him more, more
Than e'er wife loved before,
Be the days dark or bright.

[*Jean Ingelow.*

FARMERS' WIVES' WORK.

I HAVE nothing to say about myself, except that I have always lived in the country and know what country life is in all its phases—have had from twelve to twenty-five cows, and eleven of our own family, aside from hired men, to work on the farm, *but no hired girl.*

I have lived away from our own neighborhood, too, and never yet was so unspeakably miserable as to encounter that family, or member of that family, as slack, slovenly, sticky and nasty, as represented by "SALLY TEAZLE," in the RURAL of Oct. 12.

AS "SALLY" has given you one side of the question, let me cite you to just one instance on the other side, for the benefit of those who are unacquainted with farm work, if any such should read these lines. At my left is a lady, very refined, intelligent and accomplished, though all farmers' wives have not had the advantage that is necessary to acquire a good education. I have seen, however, those who were the very best housekeepers who had no education, and could hardly read; but not commonly, for they are very scarce who do not know more about business and state affairs in the "outside world," away from their farms, than the most cultivated and accomplished city lady.

But about this woman:—She lives on a farm. It has been my privilege to become intimately acquainted with her; have been in her home at all times of the day and know pretty well how she manages and does her work.

At the present time she has sixteen cows, three children, herself and husband, and from five to eight hired men to do the work for in warm weather; and one, and sometimes more in the Winter. I will merely mention some of the larger items of work and say nothing of the many smaller ones, such as washing, ironing, filling beds, making quilts, piecing calicoes, making soap, helping to make garden, gathering seeds and fruit, preserving fruit in the many different ways, picking cucumbers, cleaning house, making and putting down carpets, entertaining company, and doing occasionally a few chores here or there out of doors to help her husband when he is in a particular hurry, to say nothing of the thousand (I was about to say) of other little jobs that take time, and that all industrious farmers' wives have to do, or do accomplish.

In the morning, after this lady arises, the first thing she does is to put the beds and sleeping rooms airing. She then goes to the kitchen, builds a fire and puts the water heating to wash milk pans with; then she skims and empties milk, and sometimes has as many as sixty pans, though not always. By this time the two youngest children are up and ready to be dressed and combed. Then the men come in with a part of the milk, which has to be strained, and while they are gone to finish the milking she washes the pans and gets breakfast at the same time, her vegetables and meat having been put in readiness the evening before)—the men come in with the remainder of the milk and ready for breakfast.

After devotional exercises she is ready to do her morning's and chamber work, mop the floors, or bake pies, or cake, or bread, or any other article which she may need. Baking does not occur every day—only every other, or once in two days. When she does not have to bake she has some time to spare before it is time to get dinner, which is filled with promiscuous work that one can always find to do.

Then she gets dinner, does up the work and is ready to go to sewing, or knitting, or visiting, or to the village two and a-half miles distant. I have met her several times in the village when she told me her husband or herself had some errands to do, so she had hitched up the horse to do them, adding that she would have to get back in time to get supper.

After supper she has milk to skim again, pans to wash, perhaps a churning to do, and calves to feed, which she invariably does. Then, after the children are put to bed, the rest of the family spend an hour or two in reading or talking before retiring. She works, neither grumblingly nor complainingly, for the reason that she has her husband's encouraging words, instead of fault-finding because she don't do as much as some other woman that he can think of.

I do not claim that she does any more than many other women, though she does more than some; but the foundation of this is her health, she having had a healthy mother, with but little hard work to do, who has bequeathed to her daughter a good, strong constitution. Thus she enjoys herself and gains the love of her husband to a greater extent than the weakly woman does.

I know of women in our neighborhood who are just as energetic, and even "spry" as Mrs. R., who feel just as much interest in their work and would willingly hurry and run from one kind of work to another, if their health would permit; but if they were to work until dinner-time steadily, they would give out, and have "a spell" of two or three days, and perhaps more, when they could do scarcely any work, much worse than being down sick; for then one gets some sympathy. When one is not down sick, ten chances to one the husband accuses the wife of "grunting around." H. H.

WHAT SHALL GIRLS DO?

PLEASE pardon my intrusion on your time and space. I should like to answer "What Shall the Girls Do?" but know that I am not capable of doing it justice. To the girls I would say, do not be dependent and helpless. Fit yourselves for some honorable, noble employment. Strive to be the best of your kind. But should GOD call you to be a wife and mother, never think that you can leave your child to the care of an ignorant woman, even if she be kind and strong. Who can fill the place of a mother to her child? Surely not an ignorant hireling, who has no interest in it beyond the money she gets for her labor.

Leave a child to the care of an ignorant person, and just stop and think in how many ways said ignorance will affect the child. It is by some said, intelligent women are fitted to do something above baby tending. I ask, what is more exalted than the training of an immortal mind? Children are taught to appear to be many things that are supposed to be desirable. But alas! how few are trained to make true, noble, Christian men and women! Put the next generation under the care and influence of none but true, noble, intelligent mothers, and what think you would be the consequence? We cannot have the faintest conception. From a mother who is striving to train her children to be true Christian men and women. E. M.

WOMAN PERSONALS.

WHEN free from the cares of State, nothing can be simpler than the daily routine of life Queen VICTORIA leads at Balmoral Castle. She manages her household on very strict principles, the servants rising according to merit—promotion always being held out. For a stupid act one member of the royal household had to wait ten years for promotion. Her Majesty rises at seven, breakfasts at nine, and then attends to dispatches and private correspondence. Luncheon is at two, after which she takes the air in her carriage. During meals a piper plays in front of the window. She dines at half-past eight, in the library, not having used the large dining-hall since the death of her husband. There is no display in the library—the arrangements are of the simplest character. She spends much of her time alone in Prince ALBERT'S room. She comes quietly in to dinner, with her knitting in her hand, and retires early. She is a woman of great method. In all weathers she is seen abroad. A rainy day does not keep her in; with a water-proof and an umbrella she defies the elements. It is quite a common thing to see her walking in the grounds under a drizzling rain. She is a hardy woman, having no "fine lady" fancies. She dresses consistently with the climate and the weather; and a fresh, comely, sensible-looking lady she is in her comfortable plain jacket and broad-brimmed straw hat.

THE women of Boston are as active as those of New York this Winter. At Mrs. SARGENT'S parlors, on Chestnut street, the Radical Club has given a reception to Col. HIGGINSON. The Woman's Club has welcomed Mrs. JULIA WARD HOWE and Miss ELIZABETH PEABODY from England. Mrs. HOWE has returned in full health and spirits. Miss PEABODY is as interested in kindergarten schools as ever. The Bureau of Education at Washington has recently published one of her instructive pamphlets. Miss ALCOTT is working on her new book, "Shawl Straps." Miss WOOLSEY ("SUSAN COOLIDGE") has written a book titled "What Katy Did," and CHARLOTTE CUSHMAN and Mrs. HARRIET BEECHER STOWE have been delighting audiences with their readings.

VINNIE REAM was present at the laying of the corner stone of the 23d Regiment Armory in Brooklyn.

THE Ex-Empress Carlotta will leave a fortune of $5,000,000.

Reading for the Young.

WHAT THE CHOIR SANG ABOUT THE NEW BONNET.

A FOOLISH little maiden bought a foolish little bonnet,
With a ribbon, and a feather, and a bit of lace upon it,
And that the other maidens of the little town might know it,
She thought she'd go to meeting the next Sunday, just to show it.

But though the little bonnet was scarce larger than a dime,
The getting of it settled proved to be a work of time;
So when 'twas fairly tied, all the bells had stopped their ringing,
And when she came to meeting, sure enough, the folks were singing.

So the foolish little maiden stood and waited at the door,
And she shook her ruffles out behind, and smoothed them down before.
"Hallelujah! hallelujah!" sang the choir above her head—
"Hardly knew you! hardly knew you!" were the words she thought they said.

This made the little maiden feel so very, very cross,
That she gave her little mouth a twist, her little head a toss;
For she thought the very hymn they sang was all about her bonnet,
With the ribbon and the feather, and the bit of lace upon it.

And she would not wait to listen to the sermon or the prayer,
But pattered down the silent street and hurried up the stair,
Till she'd reached her little bureau, and in a bandbox on it
Had hidden safe from critic's eye, her foolish little bonnet.

Which proves, my little maidens, that each of you will find
In every Sabbath service but an echo of your mind;
And that the little head that's filled with silly little airs
Will never get a blessing from sermons or from prayers.

EVENING CHATS.

BY UNCLE CHARLES.

About a Definition.

BELLE came to me to-night and clambered into my lap, as I sat dreamily watching the fire, and said:

"Uncle, what is a definition?"

Why do you ask?

"Because we girls have to give the teacher the definitions of words; but she has never told us what a definition is."

What do you suppose it is?

"I do not know, unless it is what a word means."

Yes; that is it when you give the definition of a word; but when you are asked for a definition of a thing—such as a book or apple or stone or insect, then what is it?

"I cannot tell, Uncle."

It is then a definition of its properties—such as form, color, quality, its parts, and their composition and peculiarities.

"But, Uncle, those are hard words, and I don't know what they all mean."

There is your dictionary; find out. Wait a moment. Here is an apple. What is an apple."

"Why, it is a fruit."

Yes; but what is a fruit?

"Why, it is—it is——"

Never mind; we will talk of that some other time. There are few people who know what fruit is. Only to-night, at the table, I heard some one ask for "that vegetable dish"—meaning a dish of tomatoes, which does not happen to be a vegetable at all.

"What is a tomato then, Uncle?"

Why, a fruit, just as much as a pear, apple, or grape is. But about this apple. Where did it grow?

"On a tree."

What kind of a tree?

"An apple tree, of course."

What is its shape?

"Nearly round."

Its color?

"Crimson, green and yellow."

What is this?

"A stem."

And this?

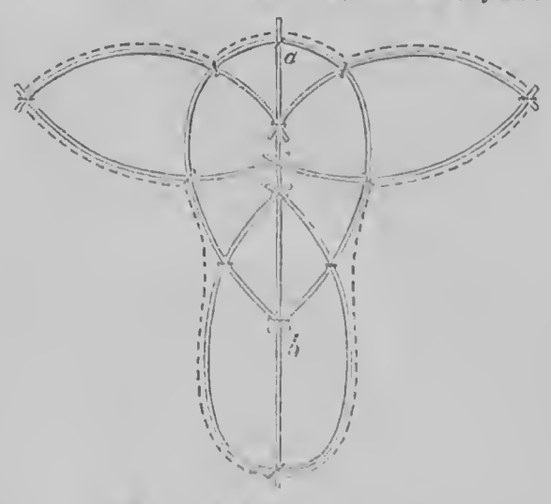
"Why, Uncle, I don't know."

It is a calyx, and I leave you to find out what that is, and tell me. Now I cut it open, and we find it has a skin, core, seeds, flesh, juice, fragrance and flavor. This apple, as you said, is the fruit of the apple tree—*Pyrus malus.* That distinguishes it from other apples; for since I can remember the tomato was called an apple—a love apple; and other fruits are sometimes called apples.

Now, I told BELLE what I tell the young readers of the RURAL, to find out all she could about the apple (and what other fruits are called apples) and write what she learned, for me to read at my leisure, and perhaps it may give us something further to talk about. It is such a common fruit, and yet how few of you know anything about it, except that it grows on an apple tree and is good to eat. The boy or girl who sends the RURAL the most interesting facts about the apple shall have his or her name published, and perhaps what he or she writes, as well—if I can induce the editor to print it.

THE JAPANESE BIRD KITE.

THE frame is made of thin bamboo, as in the sketch, and is covered with colored paper. The wings, which are somewhat concave, and fall back a little, are dark maroon, and the body and



tail represent a Japanese lady. Small, white twine is used. By various devices the hovering and soaring of a hawk can be admirably imitated. Length of middle cane, twenty inches; spread of wings, twenty-six inches; *a b*, points where the "belly-band" is attached. Dotted lines show the paper.

The Puzzler.

ILLUSTRATED REBUS.—No. 16.

☞ Answer in two weeks.

BOTANICAL RIDDLES.—No. 2.

1. Which is the tree that with death will benight you?
2. And the tree that your want will supply?
3. The tree that to travel invites you?
4. And the tree which forbids you to die?
5. What tree do the hunters resound to the sky?
6. What brightens your house and your mansion sustains?
7. What tree urged the Germans in vengeance to rise
And fight for the victims of tyranny slain?
8. The tree that will fight? 9. The tree that obeys you?
10. And the tree that never stands still?
11. And the tree that got up? 12. The tree that is lazy?
13. And the tree neither up or down hill?
14. And the tree to be kissed? 15. The dandiest tree?
16. And what guides the ship to go forth?
17. The tree of the people? 18. The unhealthiest tree?
19. And the tree whose wood faces the north?
20. The emotions tree? 21. The industrious tree?
22. And the tree that warms mutton when cold?
23. The reddish-brown tree? 24. The reddish-blue tree?
25. And what each must become e'er he's old?

☞ Answer in two weeks.

MISCELLANEOUS ENIGMA.—No. 5.

I AM composed of 32 letters:
My 1, 26, 6, 7 is an art in sewing.
My 15, 23, 14, 6, 17 we'll let the feathered tribe do.
My 4, 21, 27, 7 is what some do not like to do.
My 32, 12, 1, 31, 5, 8 is my sweetheart's name.
My 25, 11, 21, 4 is very hard work.
My 22, 23, 6, 21, 19 is a town in Georgia.
My 2, 3, 23, 9 every person has.
My 10, 13, 23, 14 is an achievement.
My 16, 18, 28, 31 is a point of the compass.
My 25, 30, 23, 6, 2 is a delicious fruit.
My 20, 23, 21 is a nickname for a girl.
My 25, 29, 31 is to set.
My whole is a wise saying from the Bible.

News of the Week.

CURRENT TOPICS.

Death of Mrs. Horace Greeley.

As we write this paragraph (Friday, Nov. 1,) the veteran Editor of the Tribune and candidate for the Presidency, Horace Greeley, is burying the wife of his youth. No one who knows him, and how devoted and tender a husband he has been, especially during the twelve years his wife has been an invalid, will fail to sympathize with him in this ordeal of separation. Mrs. Greeley's maiden name was Mary Young Cheney. She was born at Litchfield, Connecticut, in 1814. In her early life she was a teacher of rare abilities. She became an ardent believer in the hygienic teachings of Dr. Graham, of Graham bread notoriety, and it was at the Graham House in this city that she first met Horace Greeley. He loved her and sought her hand. She finally went to North Carolina as a teacher. Thither Mr. Greeley followed her and induced her to marry him. Five children have been born to them, two of which survive. Mrs. Greeley's character was as strongly marked as her husband's, but of a widely different type. Her organization was fine, delicate, sensitive, nervous; slight and fragile, physically; strong, original, firm mentally, looking at nothing through other eyes than her own, and following her convictions, regardless of public opinion or convention. She was a devoted mother, and a woman who won fast and faithful friends among women. Thus, on the eve of an election which is to decide Mr. Greeley's fate as a candidate for the Presidency, and which will have decided it ere this paragraph reaches the eyes of our readers, Mr. Greeley is bowed beneath a burthen of affliction which proves the hollowness and emptiness and bitterness of earthly honors and the acclaim of his fellow citizens in comparison with the domestic ties which have strengthened during the arduous struggles of a busy life.

The Horse Disease.

This disease has extended South and West, and is also announced as having appeared in England. Its effect upon trade in all the large cities is beyond computation. In this city it has almost paralyzed trade. Immense heaps of freight and merchandise lie along the wharves and fill up the railway depots, and are packed and stowed in wholesale houses, manufactories, and other places of shipment, awaiting transportation. The canals are virtually closed. Thousands of bushels of grain, packages of fruit and vegetables are not sold because they cannot be delivered to consignees. Cotton is accumulating mountains high on the wharves. The prices paid for moving such goods as are moved are enormous and exorbitant. From $15 to $25 per load for moving ordinary merchandise is charged by cartmen, and in many cases $50 is asked. The loss to the city marketmen in consequence of this condition of things, is placed at $40,000 to $50,000 per day. Handcarts drawn or pushed by men at high wages are used largely. We do not hear that any mules are suffering from the disease. We do not doubt that the present condition of things will attract attention to this hardy, easily kept and serviceable animal. It ought to do so. Oxen have been introduced by some firms, but compared with the magnificent horses that perform the city's transportation, they are inferior. Traction steam power has now its opportunity to develop itself.

Fire at Sea.

The steamship Missouri, Capt. M. R. Green, left New York for Havana Oct. 17, and was burned at sea about twenty-five miles from Abaco, only twelve lives being saved out of nearly 100 on board. The fire was discovered in the pantry and soon burst out amidships; a strong gale blowing, the ship was soon wrapped in flames. The boats were launched, but all but one was immediately swamped. This sad story needs no garnish; nor can any words express the horrors of such a fate; nor are there any imprecations that can reach and remedy the causes of such disasters; but there is need of radical measures to compel ship owners to provide for the safety of passengers in such cases as this—if it is within human power to do it.

DOMESTIC NEWS.

New York City and Vicinity.

The horse disease has raged during the past week with violence, interrupting travel and trade. Many horses have died. Oxen have been used to haul goods. Steam dummies have been allowed on the tramways. The crisis is now passed, and travel is resumed.... Mayor Hall's trial closed on the 31st....The funeral of Mrs. Greeley took place Nov. 1st. INDUSTRIAL SOCIETIES.

The Ohio State Hort. Society holds its annual meeting at Zanesville the first week in December.

The North American Bee Keepers' Association holds its next session at Indianapolis Dec. 4, 5 and 6.

The New Hampshire State Board of Agriculture has decided to hold Fall and Winter meetings at Colebrook, Gilmanton Iron Works, Dover, Deerfield, Acworth and Peterboro.

A Convention of Delegates from the Hort. Societies of Illinois, is called at Bloomington, Nov. 14, to meet the Executive Committee of the State Hort. Soc., "to consult together in devising means to insure harmonious co-operation, and to secure State aid in the dissemination of horticultural information."

THE MARKETS.

MONEY AND TRADE AFFAIRS,

New York, Monday, Nov. 4, 1872.

General business has been somewhat retarded through the past week by the epidemic among the draught horses. The pending election, also, had the effect of dulling trade for the time being. It is hoped that both causes will be removed in a few days Certainly before this paper reaches our readers the result of the Presidential Election will be known.

Since our last report, the Secretary of the Treasury has published the Monthly Schedule of the Public Debt of the United States to the first of November. It appears that a further reduction was made in the Principal of the Debt in October, of $5,228,000. The reduction in the Gold Bearing 6 per cent Stocks (5-20s,) was over $3,000,00 which is an additional saving of Gold Interest to the amount of $540,000 a year. The circulation of the Treasury was increased about $4,000,000, the Treasury having afforded this relief in the shape of Greenbacks to the banking movement early in the month, to avert a threatened panic in Wall St.

Money is working less stringent, although the supply cannot be called comfortable for that class of borrowers who rely upon discounts at Bank at 7 per cent., or on Wall Street at 8 to 12 per cent. These are the rates on nearly all time operations. The Stock Brokers borrow Money from day to day at 6@7 per cent. A great many lenders are unwilling to place their balances beyond call, even at much higher rates.

Gold has gone down 1½ per cent. The disbursements from the Treasury for November, Interest on the Public Debt, and the free supply of Exchange have effected the market.

In Stocks the speculation continues very active, with varying fortunes to the great operators in the Railroads, Telegraph and Pacific Mail Stocks. The prevailing belief is in higher prices after the Presidential Election, but this feeling may change in a day on the appearance of pressure in Money or upon any change of position in the market by the controlling operators.

The following are the comparative movements of the City Banks for the past fortnight:

	Oct. 26.	Nov. 2.
Capital	$88,019,200	$88,019,200
Loans	274,925,000	237,832,300
Gold and Greenbacks	53,137,100	47,525,100
Deposits	209,202,400	203,202,400
Circulation	27,686,000	27,686,000

PRICES OF GOLD, STOCKS AND BONDS.

PRODUCE AND PROVISIONS,

New York, Monday Nov. 4, 1872.

Receipts.—The receipts of the principal kinds of produce since our last are as follows:

Corn, bush	503,000	Meal, bbls	5,000
Oats, "	182,500	Flour, "	84,200
Wheat, "	542,500	Eggs, "	8,180
Rye, "	—	Cotton, bales	25,200
Barley, "	200,000	Hops, "	1,485
Malt, "	28,000	Wool "	732
Seed, "	300	Butter, pkgs	23,400
Beans, "	1,815	Cheese "	13,800
Meal, bags	500	Lard, "	5,500
Peanuts "	532	Dried fruits, pkgs	750
Pork, bbls	176	Cut Meats "	2,740

Beans and Peas.—The stocks in first hands of mediums are very moderate owing to the recent speculative movement, and with an improved jobbing inquiry, prices have advanced. Marrowfats are held a trifle higher, as the supplies show some decrease, and there is a moderate shipping trade. Green Peas are slow of sale. Canada peas are in light supply and wanted.

We quote Mediums, prime $2.55@2.60 per bushel; good do., $2.20@2.40; fair do., $2.00@2.25; prime marrowfats, $2.75@2.80; good do., $2.40@2.50; common and fair do., $2@2.35. Green peas at $1.75@1.85. Southern black-eyed peas, $2.80.

Beeswax.—Export for past week, 7,400 lbs.; since Jan. 1st., 282,800 lbs.; same period last year, 200,000 lbs. Prices have declined to 32½@33c.

Broom Corn.—There is little difference in prices for old or new. Green is quoted at a range of 6@7c.; mixed, 5@6c.; do. red, 2@3c.

Butter.—The event of an important election occurring this week has its usual tendency to interrupt the steady course of trade, and there are consequently no solid features to note. Fine grades of butter hold up in prices stronger than was anticipated, especially under the free receipts. Common, or, for that matter, real useful stock, is neglected, while we are in receipt of the flower of the crop, but after the standard of taste occasioned by the fine stock now offering becomes less delicate as the season advances there will be a market for stock that has been kept out of commerce for many past weeks. Better lines of Welsh are coming forward. There have been shipments abroad of about 600 pkgs. cheap Western, and it is thought that some round lots of low-priced stock will find a German outlet.

Orange Co. pails, fine, 38@40c.; Penn. and N. J. pails, good to fine, 29@35c.; common, 15@18c.; selections, half tubs, 32@35c.; half tubs in lots, 38@40c.; good to prime firkins, 27@29c.; do. Welsh, Fall, 27@28c.; Welsh tubs, fair, 20@23c.; other grades of State, 18@22c.; Western Reserve, choice, 21@22c.; Western fair to good, 13@15c.; common, 10@11c.; grease butter, 7½@8½c.; State dairies, tubs are 29@32c.; do. all firkins, 28@30c.

Cheese.—There is no stir in the shipping trade; the exports for the week are only 12,770 boxes. The home trade is improving as vehicles become more plenty. Prices are steadily held and without important change from last week. The arrivals are fair, embracing larger lines of fine stock, but holders are under the impression that they will be able to sustain prices, temporarily at least.

We quote State factory, choice, 14½@15c.; good to prime, 13½@14c.; fair, 12½@13½c.; State dairy, 13@13½ for good to prime, 12@13c. for fair lots; for Ohio factory, 13½@13½c. for good to prime; English dairy, prime, 13½@14c.; fair do., 11½@13c.

Cotton.—Prices are about as last week. There has been a good export trade, but the arrivals are large and freely offered.

	Uplands.	Alabama.	N. Orleans.	Texas.
Ordinary	18⅝	16	17¼	17¼
Good Ordinary	18⅞	19	19⅜	19⅜
Strict Good do	19 1-16	19⅜	19⅜	19⅜
Low Middling	19¼	19½	19⅝	20
Middling	19⅝	20	20⅜	20½
Good Middling	20⅜	21⅛	21⅜	21⅝

For forward delivery sales on the basis of low middling are as follows:—Nov., 18 9-16c.; Dec., 18 11-16c.; Jan., 18¾c.; Feb., 19c.; March, 19⅛c.; April, 19¼c.; May, 19⅜c.

Dried Fruits.—Shippers are looking at some rather better lots than before, offering 16@16½c. Peaches firm at quotations. Small fruits firm, with cherries scarce and wanted. There is some jobbing trade in sliced apples, but they are too abundant for any higher range.

Southern apples, 3½@5c.; do. sliced, 7@9c. Peeled peaches at 14@17c. for Ga., 14@16c. for Va., and 17@21½c. for North Carolina. Unpeeled peaches at 5½c. for quarters, and 6c. for halves. Cherries, 25c. Plums, 14@19c. Blackberries, 9@9½c.

Flour.—Prices are about as last week. Stocks have accumulated materially. The light home trade, through the difficulty in moving supplies, has induced some holders of best grades to force a market, but at the close the business from this source is improving and there is a more confident tone. Shippers have been working to an extent on the low grades to keep prices steady.

Superfine State	$5 90	@	6 30
Common extra do	6 90	@	7 00
Good to choice do	7 05	@	7 15

Common to fair extra St. Louis	7 25	@	8 50
Good to choice do	8 35	@	11 00
Extra Southern	7 25	@	9 75
Good to choice do	9 80	@	12 00
Rye, common to fine	4 50	@	5 75
Corn meal, Western	3 25	@	3 60

Fresh Fruits.—Exports of apples for past week, 7,850 bbls. There is only a retail trade in apples at the prices. The market is generally unsettled when we are on the eve of canal and heavy Western receipts. Prices have ruled withal rather steady, an active export trade giving considerable support to the market for straight sound lots. Grapes are very weak, and sellers are anxious to close them out. High price for quinces checked the sale, and they are offered easier. Pears are running out, and extras are firm. Cranberries have moved slowly, and sellers are shading quotations. Old peanuts are lower and quoted at $1@1.25 for Wilmington, and $1.75 for best Virginia. New do not come forward freely; there have been sales at $1.50@1.75 for Virginia. Chestnuts higher.

We quote:—Apples, prime, $2.50@2.75; mixed, $2.12@2.37; fair, $1.25@1.75; common, $1. Pears.—Fine Duchess, Seckel, Louis Bonne, Virgalieu B. Diel, $12@14; rough lots do., $8@10; cooking, $1@7. Grapes, Isabella, 6@7c.; Catawba, 7@8c. Cranberries, per crate, fine, $3.25@3.50; other, $2.25@2.75; bbls., $11.00@12 for Cape and $9@11 for N. J. Chestnuts, per bush., $3.50@4. Hickory nuts, $1.75@2.

Grain.—Best Spring grades of wheat are in good demand from shippers at improved prices. Other stock plenty and freely offered. We quote at $1.51@1.58 for No. 2 Spring afloat, $1.60@1.63 for No. 1 do., $1.30@1.67 for Winter red Western, $1.68@1.90 for Amber and $1.75@2 for white. Rye is wanted at about 85c. Corn is coming in slowly and prices are in the seller's favor, with a moderate export trade. Sales at 64½@65c. for steamer lots of Western mixed; 65½@66c. for sailing do., 64½@65c. for store lots. Oats are steadily held with moderate receipts. Sales at 43@43½c. for new mixed Western, 47@48½c. for old do., 46@50c. for new white, 46@47c. for State. Western barley selling at 70@85c.

Hay and Straw.—There is a good demand for straw, and more stock could be handled at the quotations. Hay is selling freely to shippers, but there is not much call from home trade. We quote new shipping hay at 95c.@$1.; retail do., $1.20@1.50; salt, do., 55@80c.; clover, 75@80c. Straw at $1@1.05 for long rye, 75@85c. for short rye; 70@75c. for out.

Hops.—The market here has been better supplied but there is no accumulation, brewers being in great need of stock and purchasing promptly the best lots on arrival. The current quotations here afford more inducement to buyers in the interior to pay prices on the basis of late sales to growers.

New York, growth 1872, at 30@35c.; Eastern do., 30@35c.; Western do., 30@35c.; Yearlings '71 20@25c.; Olds '70 10@15c.; Old Olds, '68-69 8@10c.; Bavarians, 30@35c.; English, 25@30c.

Provisions.—With the turning into a new month there is less strength showing in prices for mess pork as buyers are less anxious. Cash lots offered at the close at $15.37 and $15.12 for all Nov. Jobbing lots have declined to $15.50, with free sales at that price. Extra prime scarce, quoted at $12, prime mess $15, clear $17. There has been about 2,000 tcs. new beef taken for Europe. New prime mess quoted at $21@23.50, India $25.50@24.50. Old is nominal. Bacon is in demand, but to open trade sellers have been compelled to submit to a decline. Spot long clear 8¾c. Winter months long and short together 7¾c. Short for Jan. alone 7¾c. Lard is steady at 8⅛@8¼c. for Western steam, 8¾c. for Western kettle, city dull at 8¼ for steam and kettle and 8c. for No. 1. There is only a light demand for cut meats, and prices are favoring buyers. Smoked hams 15@16c., smoked shoulders 7½@7¾c., pickled hams 13½@14½c., pickled shoulders 6½@7c. Beef hams per bbl. Winter 28@30c. Boxed bellies 8⅝@8¾c., bellies loose 8c. Tallow—City choice firm at 9¾c., country 8¾c. for common, 9@9¼c. for good

Poultry and Game.—The demand is improving for poultry, and prices are more in the seller's favor. There seems to be a wise intention this year on the part of shippers to not glut the market before Thanksgiving

We quote dressed poultry:—Chickens, Jersey and Bucks county, prime, 18@20c.; do. fair to good, 16@18c.; do. State, prime, ₹ lb., 16c.; do. fair to good, 14@15c.; do. Western, prime, 15@16.; do. poor to good, 12@14c. Ducks, Jersey prime, 21@22c.; do. fair to good, 17@18c.; do. State, prime, 20@21c; do. fair to good, 17@19c. Turkeys, State, prime, 20.; do. fair to good, 17@19c.; Western, good to prime, 18@19c.; do. fair to good, 15@16c. Geese, Jersey, prime, 17@19c.; do. fair to good, 15@16c.; do. State, prime, 17c.; do. fair to good, 15@16c. Live Poultry:—Chickens, Jersey, ₹ lb., 14@15c.; do. Western, 13@14c.; roosters, 9c. Turkeys, Jersey, 16@17c.; do. Western, 15c. Ducks, Jersey, ₹ pair, 75c.@$1; do. Western, 62@75c. Geese, Jersey, young, ₹ pair, $2.25@2.50; do. Western, $1.75@2.

There is a good sale for the enlarged list. Venison, whole deer, per lb., 15@16c.; saddles 20@22c.; canvas back ducks, $2@2.25 per pair; mallard and teal do., 40@60c.; woodcock do., 75@87c.; partridges, state, 87@$1.12; do. eastern, 62@75c.; quail per doz., $2.75@3; prime

hens per pair, 35@$1.00; rabbits, 30@40c.; hares do., 60@75c.

Seeds.—Small lots of new clover are coming in. There is a very light sale just now. Timothy is selling at $3.25@3.50. Clover at 9¼c. for Ohio, 10¼c. for Indiana and Michigan, and 10½c. for State. Rough flax is quiet, quoted at $1.95.

Sundries.—Honey is active at firm figures: 28@30c. for dark and 32@35c. for white, in glass boxes; mixed lots, 21c. Cider at 6@10c. per gallon. Feathers, live geese, new, fine, per lb., 60@70c.; do. mixed, 40@50c.; hen, 7@9c.; vinegar, cider, ₱ gal., 20@25c.; do. manufactured, 15@20c.; newspapers, ₱ b., 1@1½c.; white rags, 5@5½c.

Tobacco.—In Kentucky leaf there is a very good business for this season of the year. Lugs, fillers and the poorest grades bring very good prices, while for medium and common stock the market is more in the buyer's favor. The new crop is reported in good order and all housed. The estimates place it as a very large crop, but containing more than a usual quantity of the lower grades. Seedleaf is selling to the home trade only; the export business for the season is about over. The Connecticut crop has all been gathered in fine condition, with an unprecedented quantity. Wisconsin has raised nearly 15,000 cases of good tobacco. The crop in Pennsylvania is estimated at 40,000 cases, very fine quality.

QUOTATIONS—NEW CROP.

	Light Grades.	Heavy Grades.
Lugs	9¾@ 9¾c.	9¾@10¾c.
Common to medium leaf	10 @10¾c.	10¾@11¾c.
Good do.	11 @11¾c.	11¾@12¾c.
Fine do,	11¾@12½c.	13 @14 c.
Selections	13 @14 c.	15 @16 c.

NEW CROP.

Connecticut and Massachusetts fillers	14	@16 c.
seconds	26	@35 c.
wrappers	41	@55 c.
selections	50	@75 c.

Garlic, ₱ 100 bunches	16 00	@18 00
Russia turnips, ₱ bbl	3 50	@ 3 00

For potatoes in shipping order, add 25c. ₱ bbl.

Whisky—is higher, quoted at 95c.

Wool.—Prices have advanced a trifle under an active demand from manufacturers and speculators. The supplies are not sufficient to meet much improvements in the demand, and there is no hope of their being replenished, unless still higher prices are obtained here. Latest sales are of Michigan fleece at 55@57c.; Ohio, 58½c.; fine unwashed do., 46c.; North Texas, 38c.; choice extra pulled, 57½c.; super pulled, 49@50c.; full California, 26@27c.; scoured do., 90c.; Cape, 36c.

COUNTRY CHEESE MARKETS.

Little Falls, N. Y., Nov. 2, 1872.

THE market at Little Falls for the week ending Nov. 2d, was firm, but buyers did not care to take freely on account of the prevailing epidemic among horses in the city, and the consequent difficulty of moving cheese from the dock. One extensive shipping firm telegraphed its agent not to buy anything, as cheese could not be moved in the city. Farm dairies were eagerly taken at prices ranging from 13¾ to 14c., and a few lots were reported as selling at 14¼@ 14½c. The delivery of farm dairies amounted to 865 boxes, nearly half of which went by canal. In factories the offerings amounted to between 8,000 and 10,000 boxes, about 6,000 of which changed hands. We give quotations of leading transactions as follows:

Avery & Ives	14¾	Herkimer Co. Central	14¾
Bethel	14¾	J. D. Ives	14¾
Brockett's Bridge	14¾	Lasellville	14
Cook & Ives	14¾	Little Falls Central	14¾
Countryman	14¾	Manheim Center	14¾
Eatonville	14¾	Manheim Turnpike	14¾
Euphrates	14	Newville Ass'n	14¾
Fairfield Association	14¾	Old Stone Church	14¾
Old Fairfield	14¾	Paine's Hollow	14¾
Fays	14	A. Smith & Co.	14
Fulton	14	St. Johnsville	14¾
Henderson Home	14	Van Hornsville	14

Butter is coming in freely, and sales were made at 26@28c., according to quality.

We have advices from abroad for the second week in October. Our London correspondent says there is no extra fine American cheese in market, but sales to arrive are noted at 70@72s., fine, 66@68s.; good, 58@58s. The other descriptions of cheese sell as follows:—English Cheddar, 74@80s.; Wiltshire double, 62@72s.; Cheshire medium, 54@64s.; fine, 76@80s.; Scotch, 68@ 76s. Dutch cheese.—Edams, 58@66s.; Gondas, 45@58s.; Derby shape, 54@60s.

Clonmell's butter, 128s.; Corks, 132s.; Normandy extra, 118s.; Canadian, 56@110s.

The weather in Herkimer still continues mild, with an abundance of afterfeed unInjured by frosts.

Cases of horse disease make their appearance on the canal, but during the early part of the week only two or three cases were reported as occurring in the village.

LIVE STOCK MARKETS.

NEW YORK, Nov. 2, 1872.

THERE has been a falling off in the receipts of all kinds of live stock, hence the market rules very firm. The horse disease has had something to do with this light run. Wholesale butchers found it impossible to cart dressed meats in sufficient quantity from the slaughter houses, hence they dare not buy ahead. Oxen and bulls have been made to do the ordinary work of horses in delivering slaughtered animals. There is also some fears on the part of consumers that the disease now so common among horses will yet attack the cattle, hence the demand is rather falling off. Dealers also are inclined to sail close. Poultry and game claim considerable attention, as is usually the case at the first regular opening of the season. The weather has generally been favorable during the past week.

RECEIPTS OF LIVE STOCK

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.
Totals this week	7,363	60	1,655	20,802	31,481
" last week	9,550	58	2,270	26,920	44,080
Average last year	7,187	88	2,201	25,182	25,177

With a falling off of 1,387 beeves since the previous week we note ¼@½c. advance, and the market closes firm with no stock left over. Stock, during the past few days has come in very irregularly and the markets have been somewhat unsettled in consequence. Quality below the ordinary average, Texans predominating. Very few really fat cattle are on sale. Such would sell at 13½@14c. In fact some of those in the yards went at 13½c. A few of the Texans were good enough to sell at 9½@10c. per lb., while the ordinary long-horns went at 8@8¾c. Fair natives sold at 12½c. Some working oxen were brought in and found ready purchasers by parties who substitute them for horses in doing city work. There is some prospect that the supply of cattle will run short before a fresh stock of grass-fed steers can be put upon the market next Spring. The falling off of Texans over the noted Chisholm trail into Kansas, is rising 90,000 as compared with the previous year, and the natives will not make good this deficiency. Besides each year adds to our consumptive demand. One defect of last season will be remedied this year, and that is the loss of stock by exposure upon the plains without feed during the coming Winter. Owners will not again undertake to carry stock through the Winter without hay. A recent trip to that country shows an immense hay crop secured, while there is much more corn than there was last year.

The following are the closing prices for the week in comparison with what cattle brought one week ago, for net weight of beef:

	This week. Cents.	Last week. Cents.
Choice beeves, ₱ lb	13½ @ 14	13 @ 13½
Good to prime	12 @ 13	11½ @ 13½
Medium	11 @ 11½	10 @ 10½
Poorest grade	8 @ 10	6½ @ 9
Average sales	11 @ —	10½ @ —

Milch Cows.—The markets continue tame, with an excess of stock offering. Milkmen have generally made their Winter purchases. Quotations are $35 to $85 for poor to extra; but one fancy cow and calf sold for $110 and another for $95.

Calves.—The market is still firm for live calves, while hog-dressed begin to arrive in considerable quantity. A lot of live grass calves sold at $7.25 each. Quotations are 7½@9c. for half-fed to thin milk veals and 10@11c. for fair to prime, two cars Bucks Co. selling at latter price. Hog-dressed sell at 7@10c. for grass and 12@16c. for milk calves.

LATEST.—Monday, November 4, 4 P. M.—Beeves.—Fresh receipts, 150 cars at Communipaw, 117 at 100th St., and 60 at Weehawken, making 5,560 head on sale. Prime steers were unchanged, but Texans were ¼@½c. lower. A few fancy natives went at 14c. and upward.

Sheep and Lambs.—Receipts to-day, 16 cars at 40th St., 15 at 45th St., and 9 at Communipaw, making 8,083 on sale, in a good, strong market, with no change in prices.

Hogs.—Fresh arrivals, 70 cars at Communipaw, and 52 at 40th St., making 13,302 on sale. The market is stronger, live selling at 5¾@5¾c., and dressed at 6@ 7½c. as extremes, those of 200 lbs. selling 6¼@6¾c.

SPECIAL NOTICES.

A Positive Radical Cure for Rupture.—The Elastic Truss Company, at No. 683 Broadway, New York, will send their Descriptive Circulars to any person afflicted with Hernia. This Truss can be sent by mail to any part of the country.

KIDDER'S PASTILLES.—A sure relief for ASTHMA. Price, 40c. by mail. Stowell & Co., Charlestown, Mass.

☞ All NEW Subscribers to THE CULTIVATOR & COUNTRY GENTLEMAN *for* 1873, *paying in advance, previous to the close of* 1872, WILL RECEIVE THE PAPER WEEKLY, *from receipt of remittance to January 1st*, 1873, WITHOUT CHARGE.

The Country Gentleman.

Volume for 1873.

THE COUNTRY GENTLEMAN possesses an unequaled corps of Correspondents, regular and occasional, among the BEST FARMERS of All Parts of the Country—eminently practical men, who discuss practical questions from the standpoint of actual experience—and it thus constantly reflects the actual condition and progress of the husbandry of every section of the United States and civilized world.

THE COUNTRY GENTLEMAN gives in its HORTICULTURAL DEPARTMENT a continuous variety of information and suggestions, equal or superior in the aggregate, *on this subject alone*, to what is obtained in the monthly numbers of most magazines devoted to Horticulture—entirely aside from all the other diversified contents of its weekly issues.

THE COUNTRY GENTLEMAN has probably done as much as all other Journals combined, to introduce and disseminate IMPROVED STOCK of every kind through the country, and its columns present a constant record of the progress effected in this direction wherever Improved Breeds are known and valued.

THE COUNTRY GENTLEMAN, aside from its merits as a Practical Journal for farmers, horticulturists and breeders, aims at superiority in presenting a current record of AGRICULTURAL INTELLIGENCE, which shall render every number fresh and interesting when it appears, and as well worthy of preservation for reference, in this respect, as in all others.

THE COUNTRY GENTLEMAN elicits constant notes on the prospects of the Crops, from all parts of the country; and, with the above leading features, combines minor departments of a practical character, such as the Dairy, the Poultry-Yard, the Apiary, the Vineyard, and so on, and weekly presents a column for the Housewife and an interesting variety of Fireside Reading. It contains a well edited Review of Current Events, and its advertising pages furnish a directory of all the principal agricultural and horticultural establishments of the country.

TERMS.—The COUNTRY GENTLEMAN is published weekly, on the following terms, when paid strictly in advance: ONE COPY, one year, $2.50; FOUR COPIES, $10, *and an additional copy for the year free to the sender of the Club*; TEN COPIES, $20, *and an additional copy for the year free to the sender of the Club.*

FASHIONS FOR WINTER.

1170—GODIVA. The Fabric is one of the latest Paris novelties. It contains many new and very valuable features. When the upper is worn as a long, tight-fitting Basque, or Jacket (as shown in small figure), it can be worn with a loose dress. Nothing beautiful is excluded. The ornamental black piece in front is worn at the throat, and forms a neat lower cape in front; under the upper cape, may be worn a rever collar, as in the illustration; when worn in a loose dress. Nothing beautiful is excluded, it will be adapted to any material. Take six yards of twenty-inch goods. Price of pattern, with cloth model, ONE DOLLAR. See GRAND PREMIUM below.

1133—DOLMA CLOAK. Needs no lengthy description to win universal favor. For comfort, neatness, and elegance combined, it is equal to any to be found among the novelties of this winter's production. Take two and a half yards double-faced ladies' cloth. Pattern, with cloth model, 50 cents.

861—LA PIERRE OVERSKIRT. The most attractive and elegant style for making, in all kinds of material. And though for a season Polonaises have reigned, yet a spirit of change is quite evident, and we gladly accept this beautiful novelty which will gratify the wishes of thousands who desired to see overskirts again in high favor. Take three yards thirty-inch goods. Pattern, with cloth model, 50 cents.

The above engravings are taken from the **BEST** Fashion Magazine **IN THE WORLD!** It is the New York City Ladies' **AUTHORITY** in all matters of **STYLE** and Dressmaking, and the **ONLY** publication in this country that **IMPORTS** Fashions and **SELLS** paper patterns of them. It gives full information upon every point in Style, besides minute instructions in making all kinds of garments.

This number contains a large fashion plate 11 by 22 inches, **STORIES, HINTS,** Criticisms, Foreign News, &c.

Smith's Illustrated Pattern Bazaar,
Only ONE DOLLAR A YEAR!!!

GRAND PREMIUM. By sending **ONE DOLLAR** and **TWO STAMPS** with your name and address to **A. BURDETTE SMITH, 914 Broadway, N. Y.** you will be made *a yearly subscriber* to **SMITH'S ILLUSTRATED PATTERN BAZAAR.** AND the patterns with **CLOTH MODELS,** complete, of the **THREE** above engravings will be mailed to you, **FREE, AS PREMIUM.**

Either of the above patterns sent by mail on receipt of its marked price.

A CATALOGUE

of Winter Styles, selected from the Bazaar. Worth more than any Fashion Magazine to show what is *now* worn. Mailed to any address on receipt of **Two Stamps.**

We give a CLOTH MODEL with each pattern, which SHOWS every seam, plait, gather, loop, etc., how to put the garment together by the pattern, and how it will look when completed. By the use of our Cloth Models any person who can sew can FINISH the most difficult garment as easily as the plainest. They are PERFECT GUIDES.

Address, very plainly,

NEW YORK WEEKLY,

A JOURNAL OF

USEFUL KNOWLEDGE, ROMANCE, AMUSEMENT, ETC.

THE

Best Story and Sketch Paper Published.

The Most Interesting Stories are always to be found in the NEW YORK WEEKLY. At present there are EIGHT GREAT STORIES running through its columns, and at least TWO STORIES ARE BEGUN EVERY MONTH. New Subscribers are thus sure of having the commencement of a New Continued Story, no matter when they subscribe. Each number of the NEW YORK WEEKLY contains several Beautiful Illustrations, double the amount of Reading Matter of any paper of its class; and the SKETCHES, SHORT STORIES, ESSAYS, POEMS, etc., are by the ablest writers of America and Europe. The NEW YORK WEEKLY does not confine its usefulness to amusement, but publishes a great quantity of really instructive matter in the most condensed form.

The New York Weekly Departments

HAVE ATTAINED A HIGH REPUTATION FOR THEIR

BREVITY, EXCELLENCE AND CORRECTNESS.

THE LADIES' WORK-BOX.—Information instructing the ladies how to Cut and Make Dresses, etc.

JOSH BILLINGS' SPICE-BOX.—Containing a number of fresh Humorous Anecdotes every week.

THE PLEASANT PARAGRAPHS are made up of the concentrated wit and humor of many minds.

THE KNOWLEDGE BOX is confined to useful information on various subjects.

THE NEWS ITEMS give in the fewest words the most notable doings all over the world.

THE GOSSIP WITH CORRESPONDENTS contains answers to inquiries upon various subjects.

THE ETIQUETTE DEPARTMENT.—Giving instructions on Etiquette, and answering questions as to social customs which should be understood by every lady and gentleman.

THE HISTORICAL DEPARTMENT.—Containing concise descriptions of notable historical events.

THE MEDICAL DEPARTMENT.—In which tested and approved remedies for various ailments are recommended.

Each issue of the NEW YORK WEEKLY contains from EIGHT TO TEN SHORT STORIES and SKETCHES and a HALF A DOZEN POEMS, in addition to the EIGHT SERIAL STORIES and the VARIED DEPARTMENTS.

THE

NEW YORK WEEKLY

"FAMILY FAVORITE!"
THE
WEED. WEED.

The most perfect, reliable and generally useful machine in existence. For the family of the farmer or mechanic, where the work required of a sewing machine ranges from the heaviest garments of men's wear to the most delicate and ornamental fabrics for ladies and children, it has proved itself thoroughly efficient and entirely satisfactory. Of unequaled simplicity and compactness of construction, capable of being learned and operated with one-fourth the usual expenditure of time and labor, with a capacity for quantity, quality and variety of execution beyond its competitors, and a reputation for durability and reliability known and appreciated by thousands, it is offered to the people for the most critical inspection and comparison, with confidence that its obvious merits cannot fail to convince the careful examiner of its superiority. Manufactured by the

WE NOW OFFER THE

ROOT WROUGHT-IRON SECTIONAL SAFETY BOILER,

IMPROVED AND PERFECTED BY THREE YEARS' EXPERIENCE, AND THE SALE OF OVER SEVEN HUNDRED BOILERS FOR ALL MANNER OF USES.

It has been our aim to produce a Boiler constructed entirely of uniform and interchangeable parts, perfectly safe from explosion, easily enlarged or diminished in size, all parts accessible for cleaning, repairs or removal; also economical and durable.

Such a Boiler we now offer to the public, and shall constantly keep on hand all parts, ready for shipment, by which new Boilers may be furnished, or any of our Boilers in use may be enlarged, or any of their parts renewed at short notice and small expense.

The distinctive claims presented by this Boiler are:—**Safety from Destructive Explosion, the Utmost Durability, the Highest Economy of Fuel, Reasonable Price.**

The working portion is composed entirely of Wrought-Iron Boiler Tubes which are tested to a pressure of 500 pounds per square inch.

The largest Boiler is equal in strength to the smallest, as all are composed of a greater or less number of the same parts, *uniform in size and strength.* This peculiarity of construction secures very *light weight* and small size of parts: *great portability;* the largest Boiler can be carried into the most *difficult places, through doors and down common stairways, where necessary.*

Very cheap freights, owing to the very light total weight and low freight classification.

Permits *safe transportation in mining and mountain regions.*

Easy enlargement or reduction of size, without disturbing foundation or side walls.

Ready and cheap *removal and renewal* of injured parts without disturbing the rest of the Boiler, thus rendering it as good as new.

The greatest facility for examination, cleaning and renewal.

Far less cost and time for setting; the greatest compactness.

Furnishes dry steam.

Is a very rapid generator, raising steam to start the engine in ten to twenty minutes from cold water; and does not require an educated engineer to accompany it from the works, erect it and remain to work it.

It is especially adapted to the sales of Engine Builders and Machinery Dealers, as it is not necessary to keep a boiler of each size on hand in order to have an assortment of sizes; but a moderate stock of Tubes, fitted with Heads and Return Bends, can be put together to form any size required.

Liberal terms of sale are offered to the trade.

Boilers constantly on hand. Price-Lists, Testimonials, Estimates, Drawings, &c., promptly furnished.

EMPLOYER AND EMPLOYE.

THERE appears to be a great diversity of opinion on the question of hired help, if the articles which appear from time to time in the RURAL NEW-YORKER are representative views; so I will give you mine. Having had experience on both sides, as a mechanic and farmer, I am satisfied that there is with each class much that needs reform. There are, strictly speaking, two divisions of each. I will endeavor to describe them as found among my acquaintance. 1st. The worthless man, who can never be depended upon, who renders only eye service and spends what he gets in the rum shop or the saloon. Fortunately this division is small.

2d. Those who, having no farms of their own, must, for want of trades, become farm hands. This division is generally either young men, just earning their first money, or men with families to support. Of the second class I will speak first of that division who are determined to get rich, let who will suffer; and this class of employers are always complaining of their help. I know men who are always up, ready for the field by sunrise, during the longest days; take one hour to eat and rest at noon, hurry from the field to supper, eat in a hurry and back to work till sunset; and if it is possible to have a load of hay to finish, or some wheat to shock after that time, so much better. They pay grudgingly the small sum of ten or twelve York shillings for this day of fifteen hours.

These farmers are often vexed and worried because their "man don't come" as he agreed to, or won't work without watching. Another man comes along—one who knows what a day's work is, and how to treat a human being. He can always get help, and the very best. If he is with his hands in the field, they feel free to rest if tired, and work moves on easily and steadily; no extra haste; all are cheerful, and at eleven o'clock comes the call for dinner. Ample time is given to cool the heated system before eating; then the hour's rest, and all return to the field cheerful and refreshed; and often before the sun has disappeared (but never after) he calls out, "Boys, we've done enough." He pays those who desire it each evening, and all feel well pleased.

Now, you that complain of your help, tell us if you ever knew a man treated in this way who was mean enough to leave his employer with a load of hay out or a lot of grain down that he wished to secure—even if it became dark before completed. When I hear a man always complaining of his help, I am just so foolish as to think he is too mean and penurious for any man to work for who has spirit and energy enough to make a good farm hand. J. C. H.

THE AUSTRIAN INDUSTRIAL EXHIBITION.

READERS of the RURAL NEW-YORKER are aware that a great International Exhibition is to be held at Vienna, Austria, in 1873, for which preparations are made on a scale surpassing any that have been held hitherto under the auspices of other European governments. This Vienna Exposition is to open May 1, 1873. We give an illustration of the building and grounds in which it is to be held. The main building is nearly 3,000 feet long by about 700 feet wide, from the center of which rises a dome over 250 feet high and 336 feet in diameter—the largest dome in the world. The machinery department will be a mile long. There are to be pavilions for all sorts of purposes, including one for the display of the Imperial Treasures of Turkey. The grounds adjoining are to be laid out after the most approved principles of landscape gardening, with fountains, lakes, etc., added. Altogether the Exhibition will cover four or five square miles. It is under the control of Baron de SCHWARTZ SENHORN, who was Controller of the Austrian Department of the World's Exhibitions in London in 1851 and 1862.

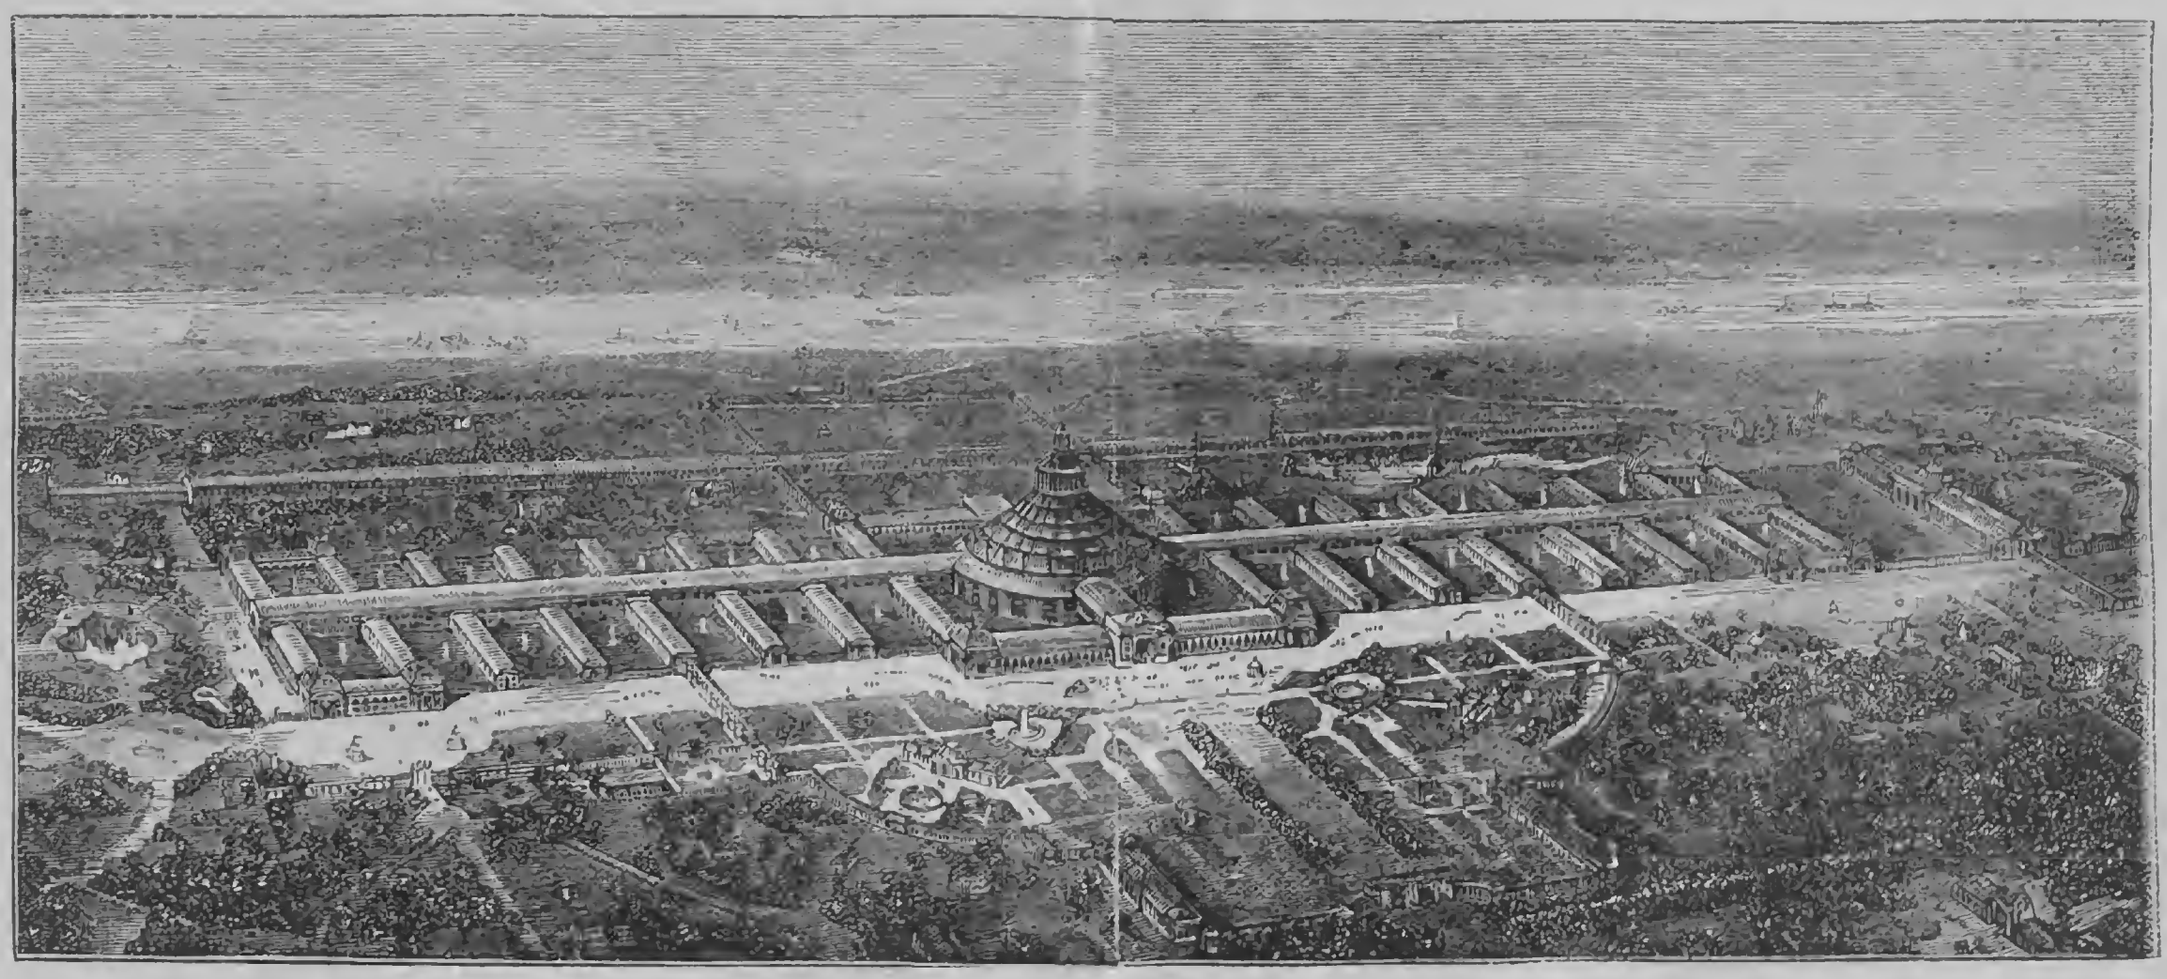
This Exhibition is located in the beautiful park and promenade known as the Prater, which is the private property of the Emperor. It will attract tourists next year from all parts of the world. Representatives of the Blood Royal from every Court in Europe are expected to visit it; also the Sultan of Turkey, the Shah of Persia and the Tycoon of Japan. It seems to be another step in the grand march towards universal brotherhood and the universal homogeneity of all races in interest, purpose, thought and fraternity.

FROM ALABAMA TO GEORGIA.

FROM Montgomery, the capital of Alabama, to Atlanta, the capital of Georgia, the distance is nearly two hundred miles, northeasterly. This route lies across the favorite cotton fields of the Alabama, Tallapoosa and Chattahoochee Rivers, but rather north of the best cotton lands of Alabama and Georgia. On this route I saw a very large acreage of land in cotton, and very little in any other cultivated crop; the yield is about one-half what may be called an average full crop. At Auburn, near the Tallapoosa, is the site of the Agricultural College of Alabama. The premises now occupied by this embryo institution, were formerly the property of the East Alabama Methodist Conference, and were made over to the trustees of the Agricultural College, to be held by them so long as they should be used for that purpose. An academic school is now in session there, but it is intended to open some sort of an agricultural department this Fall. I judge it will be rather a weakly concern, in the hands of a corps of supernumerary clergymen, but perhaps they may do better than I predict for them. Auburn is not much of a town.

Opelika is a right handsome and thrifty-looking town, on this route, some seventy miles east of Montgomery. The town (of some 4,000 inhabitants) lies up on a beautiful elevation, and is at the junction of the roads to Columbus on the south, and Atlanta on the northeast. I met an enterprising gentleman of Opelika, Mr. J. J. GREEN, who has two extensive fish houses on his premises, well stocked with perch, bream, catfish, and other varieties peculiar to the South; he has orchards of excellent fruits—apples, peaches, quinces, pomegranates, etc., etc.; his peaches of different varieties come in season in June, and last till the frosts of October. He has, also, all manner of farm stock—horses, cattle, Angora goats, fowls, etc. His residence is a place of beauty, as well as of plenty. Mr. W. C. YOUNG, a neighbor of Mr. GREEN, has a fine deer park well stocked with deer, also fish ponds and other rare improvements. The price of lands at Opelika is from $50 to $100 per acre.

I spent several days in and around Atlanta, which is a growing city, and shows many large and elegant buildings, which have been erected since my last visit, a year and a-half ago. The Georgia State Fair was in progress while I was in Atlanta; the managers had set out to run it on a strictly respectable basis, by ignoring everything more attractive than a basket of potatoes and a pen of sheep, and the consequence was they had run it into the ground. On the second day of the Fair the attendance might have been two hundred, with the most splendid weather that ever blessed the earth. On the second day, the Mayor of Atlanta issued his proclamation for the citizens to turn out on Thursday, and the



THE PROPOSED UNIVERSAL EXHIBITION OF 1873 AT VIENNA.

managers begged the ladies for GOD'S sake to come and help out the lonesome affair. Lonesome as it was there were still some very attractive features. RICHARD PETERS, the veteran stock breeder of Atlanta, had a large array of his cattle, sheep, hogs and bees; and there were good samples of vegetables, grains, cotton, and other products of Georgia.

On my way North from Atlanta to Chattanooga, I was glad to see very extensive fields of corn in full bearing. North Georgia has a heavy corn crop, and the fields of the Etowah, Coosa and Chickamauga will prove the Egypt of the State, in this year of cotton depression. I saw but little land in cotton North of Kenosaw Mountain.

With these presents I close the notes of my tour of the Cotton States. S. D. H.

Chattanooga, Tenn.

A WESTERN NEW YORK FARM.

THE Central and Western portion of New York State is considered one of the best and attractive agricultural districts in the country—not that it offers to husbandmen an opportunity to amass large tracts of territory or presents to them the fruitful qualities of a virgin soil. Such alone belong to the wilder regions of the West and some portions of the sunny South. Its peculiar adaptability lies in the fact that it is ramified by a perfect system of railroads and canals, thus bringing the produce of the farm into direct and speedy communication with the markets, and enabling the producer to dispose of his material to advantage. Prudent and far-sighted individuals have availed themselves of the opportunity; and the traveler is surprised to meet all through these portions of the State homes of opulence and beauty, their owners the proprietors of many broad acres, whose skillful tillage yields a goodly remuneration, and certainly a surer one than the speculations of Wall street.

Among those who have thus located is the Hon. ERON N. THOMAS of Rose Valley, Wayne county. The extent of his property and the success he has attained, both as an agriculturist and raiser of horses, have given him a wide reputation. The house he inhabits is of brick, 50 by 100 feet in dimensions, and within and without presents all the appearances of a city dwelling. His land is divided into three farms. These are situated near together, and embrace upward of seven hundred acres, the larger part being clear of forest or brush. The soil is suitable to the cultivation of cereals and fruits, especially the apple and grape, and the climate is such as to cause abundant crops.

Of late, Mr. THOMAS has devoted himself especially to the raising of horses. Fortunately for himself, and for horsemen generally, he became, several years ago, the purchaser of "Crittenden, Jr.," a scion of the famous trotting stallion "John J. Crittenden." Through this animal a number of colts have been obtained whose speed and build have won for them premiums at the annual fairs at Albany, Rochester and Elmira. Professor LAW, F. R. V. C., of Cornell University, lately examined a number of these animals while on exhibition in Albany, and paid them a high compliment.

In every respect this farm is a success. Science is freely consulted in the cultivation of the soil and the care of stock, and the latest inventions in instruments of husbandry are to be found in use. The result is that it pays, and Mr. THOMAS is enabled to enjoy life with comfort.

TRAVELER.

QUESTIONS FOR ANSWER.

YOUR Missouri correspondent has a long head to be able to understand, at a glance, why the negroes are poor. Can he tell why the Southern white people are poor? Can he come to so ready a conclusion why there are paupers at the North? Can he tell why the "poor darkey" won't leave his poverty in the South and go to Missouri, where he can get rich?

Two years ago I saw a Missouri man down in Tennessee trying to hire freedmen. I heard him talking to a sleek, greasy, ebony-skinned cotton-chopper. He offered him $20 per month, pay every Saturday evening, fare like his own sons, work the same as himself. After exhausting himself with eloquent arguments, the "poor darkey" showed his ivory and shook his head, and said, "Can't go dar."

Ask your Missouri correspondent why an intelligent man from Massachusetts came to North Carolina in 1866 with $80,000 in his pockets, made cotton three years, and went back penniless. Ask the same correspondent why another Massachusetts man went to Mississippi soon after the war, bought a cotton plantation for $60,000, paid $30,000 cash, made cotton two years, failed, tried to "Crawfish," was sued in a Massachusetts Court, had the whole to pay, and *nine thousand dollars costs*. These are facts; and when your correspondent can answer them satisfactorily, he will have some reason to know why the "poor darkey" is no better off than when the war ended.

A POOR WHITE MAN.

Stanhope, Washington Co., N. C.

Field Crops.

SOWING GRASS SEED ALONE.

THERE has been some discussion of this subject in the columns of the RURAL NEW-YORKER; and we regard it an important and profitable one to discuss. GEO. F. BEEBEE, Rockingham Co., N. H., furnishes the Germantown Telegraph some interesting facts on this topic. We make the following extract from his letter:

Our experience has taught us that the best time to seed with grass alone is the last half of August to the middle of September. The chief benefits from selecting this season of the year are these: first, the grass plants get well established and make a vigorous growth before Winter sets in, enabling them to withstand the sudden changes of an open Winter, or a cold backward Spring; secondly, such a sward gives a full and a more valuable crop of hay the first season; thirdly, the weeds start, and being killed by the frost, the first crop of hay is a *clean* one—an important item if designed for market.

But we cannot always perform our work at the most proper time, or cannot seed all we wish by the middle of September; hence, experience has proved to us that we need not limit ourselves to this season exclusively in seeding our lands to grass alone. Perhaps I could not make the subject more plainly understood than by detailing a few experiments from my own farm.

In November, 1866, I seeded an acre to grass alone; the ground closed up and remained frozen till Spring; consequently the seeds did not germinate before Spring. The first crop was fair, a good ton, the herd-grass or Timothy nearly half headed out, no clover sown. In the year 1868, adjoining the piece, I seeded two acres in September, which was well-started before Winter; the first crop of hay was fully matured, and the yield two tons per acre. These lands have been in mowing since, without any perceptible difference in favor of either since the first year, and yielded the best, heaviest grass on the farm through the dry seasons of 1869, '70 and '71, and are now in good condition, yielding fully two tons per acre the present season.

Passing numerous experiments in other years, I will say a word about an acre seeded last fall; it was a small mud meadow, drained and reclaimed, surrounded by poor, gravelly land; the acre was about half meadow, the balance gravel. It was plowed the Fall before, planted with potatoes in the Spring, and as soon as the potatoes were dug, the land was cleared of tops, and seeded at once to grass, without any addition of manure; the potatoes had an application of about four cords of stable manure in the Spring, spread broadcast, and well worked into the soil. There have been two crops of excellent hay taken from the piece this season; both crops were well matured in growth, and there is a fine *third crop* well started at the present time.

This experiment has been the most suggestive and interesting to me of any that I have as yet made; considering the poor quality of the land, the small amount of manure which was applied to a previous crop, the result has thus far been remarkably good. The lesson to me is this, that hereafter all my potato lands will be seeded, as soon as cleared, to grass without plowing again; and it is a hint for me to try a like experiment on my corn land this fall, both field and fodder corn. I propose to split the hills with a plow, harrow out the butts, pick and draw them to the compost heap, pulverize thoroughly and seed to grass without plowing or manuring, as the land was liberally manured in the Spring, broke up last fall, the manure applied on the furrows in the Spring. If I plow it I shall turn up a half-rotten sod, bury my manure, and can not get a catch of grass without manuring again.

Now a word for Spring seeding of grass alone. Having an acre of land last Spring which had been used for garden purposes and manured very heavily for the past three years, which I wished to seed to grass, grain being a secondary object, I ventured to try it, omitting the grain. The result is this: seeded May 7, first crop cut July 15, second September 5; the first yielded fully two tons, the second one and one-half tons; the first somewhat weedy, but the last nearly clean, and the piece is now looking finely.

The conditions of success in seeding grass alone I am inclined to think are these, without considering the quality of the land: thorough pulverization of the soil, surface application of manure, the soil and manure pulverized by the same operation. I use a home-made clod-crusher, Cumberland (England) pattern, which is very effective; thick seeding thinly covered; the soil when the job is completed compact at the surface.

The farmers of New England at the present moment are under the necessity of getting as full paying crops as possible from their fields with the least expenditure of labor consistent with good farming. We formerly thought we could not get our fields, when run out, into good grass without a hoed crop for one or more years—I am speaking now of high, dry lands—but we have proved beyond question or shadow of doubt that there is no necessity of this; that there is a quicker, cheaper, more profitable way. I have in mind a field of one of my neighbors, who never strikes out an original path, but is pretty sure to follow anything that pays better than his own practice—a good, thorough, progressive farmer, who never seeded to grass alone but once, and that the previous year. The field is high and dry; it was broken up last October; the soil was so dry that it plowed badly; manured well, not heavily; seeded at once to grass; last year the land did not produce five hundred pounds of hay per acre; the Winter was an open one, and the young grass plants were badly thrown out; clover was sown in the Spring. Now for the result—my neighbor has cut two crops from the land, fully one and one-half tons per acre each crop; the clover did not increase the first crop, but made a fine show in the second; the sward is now a perfect one, thick and even, promising a heavy yield next and succeeding years.

POTATOES FOR SEED.

THE following are the ideas of an old farmer in Maine on seed potatoes, as given in the Lewiston Journal:—We use too ripe seed when we propagate from tubers that have lain in the ground till dead ripe. Plants that are propagated by tubers require different treatment from those propagated by seeds. Our corn and grains that we use for seed we like to have stand a little longer than the main crop, and become perfectly matured. On the same principle our corn is selected from the ripest, best developed ears and kernels. But potatoes for seed should be dug and placed in a cool, dark cellar, just as soon as a majority of them will slightly crack open in boiling. This is most invariably while the tops are yet green and growing fast. The tubers are then in their most vigorous state. Disconnect them from the parent stalk at that time and they retain their vigor. Instead of deteriorating, as most all of us know the older sorts have, their vitality is increased, and they yield better, with less tendency to rot. As long ago as 1815, and subsequently, observations led him to make some experiments to test the theory, and he finds it the proper course to pursue. It is not often said that the late planted potatoes are better for seed than those planted early? The lateness of their planting, presumedly, prevents perfect ripening, hence the principle of the above reasoning would be in force.

FIELD NOTES AND QUERIES.

Castor Beans Death to Stock.—It seems certain that castor beans will kill horses and cattle. Within a year or two it has been stated in the Farmers' Club of New York City that if placed in the paths of moles or in the holes of gophers they would exterminate these animals. Now it is recorded that a span of horses in Nebraska died within twenty-four hours after eating a half handful of castor beans divided between them. Commenting on this fact the Prairie Farmer says:—"That castor beans injure stock is certain, and that death has resulted from eating them seems also sure. Among the earlier acts passed by the Legislature of this State, was one attaching severe penalties to persons who left castor beans in exposed situations or who left fields of them exposed so that cattle could enter." Our readers who grow these beans should, therefore, be careful how they expose them to stock, at least until the fact whether they kill is definitely settled, if there is any question about it.

Corn Crops.—I should like to know, Mr. Editor, what State, represented by RURAL NEW-YORKER readers, can report the largest *bona fide* yield of shelled corn for the year 1872. I am sure you will be glad to record verified reports.—R. M. F., *Xenia, O.*

The Apiarian.

FALL FEEDING BEES.

MRS. TUPPER writes the Bee Keepers' Journal:—However people may differ as to the benefits of feeding bees in the Spring, we think they will all agree that to feed in the Fall is poor economy, except in special cases. If stocks are in too poor condition to winter over, better make one good one out of two, or even three, than to attempt at this season to feed them into good safe wintering condition. We have fed stocks that had not five pounds of honey in October and made them good colonies and wintered them safely. We did it as an experiment and found that it "cost us more than it come to," a homely and ungrammatical phrase, but an expressive one.

Now our course is, to go through the apiary some time in October, see the condition of every colony, select the best queens to save, destroy poor ones, and then selecting the best combs from two colonies, place them in order in one hive, and sprinkling the bees well with sweetened water and peppermint, put them all together. This is no difficult matter. It may be done in a few moments. Every year confirms our opinion that a strong colony is the only one that preserves any value. We know that after a poor season the desire is strong to keep as many stocks as possible, but in this matter our strength is not in numbers. Better have one good one in the Spring than a dozen that have barely lived through; you will be better off even in point of numbers by June. In a good season and under favorable circumstances one can increase very rapidly (if he knows how)! In a poor season, when all is unfavorable, he had better far unite than divide. We have often found this true.

The exact amount of honey necessary to keep a colony through the Winter can hardly be estimated, so much depends on the season, the locality and the manner of wintering. Remember that bees do not waste it if they have a surplus, and that if it is not too much in the center of the hive it is no disadvantage if they have more than they need.

The Vineyard.

VINEYARD NOTES.

Keeping Grapes.—The editor of The Fruit Recorder says he has good success in keeping grapes in Winter by cutting the clusters with as long stems as possible, removing bruised or decaying specimens, dipping the end of the stem in mucilage, wrapping in pieces of newspaper, packing carefully in shallow boxes, and storing the same in a cool place till cold weather, and then transferring them to a room next or between rooms that are kept warm through the Winter. For this purpose he recommends Diana, Iona, Isabella, and Rogers' 1-5. Even Concord retains its virtues till January. He has also had very good luck with grapes, picking them right from the vines and putting in boxes in layers with paper between.

A CALIFORNIA grape grower, it is said, keeps his grapes any desirable length of time by packing them, when perfectly free from external moisture, in dry sawdust, and then burying them in the ground under a shed. He uses nail casks for packing, because they are easily and cheaply procured, but any cask or box would serve the same purpose. The sawdust must be perfectly dried, either in the sun or in an oven, and the place where the packages are buried must be secured against the possibility of any water settling around them.

The Red Tomato Grape.—In the publication of my description of a grape (see page 268) found resembling a tomato in shape, you make me say, the *cluster* resembled a tomato in shape, which is a mistake of yours or mine. The mistake is made by omitting the word "on," which should precede "one of the clusters." To be more explicit, this is a grape which cannot be distinguished from a tomato in appearance; grew upon a large cluster of one of ROGERS' *blue* grapes; and this red tomato grape is much larger than the blue. I supposed President WILDER the originator of the Trophy tomato, and knowing him to be also well versed in the mysteries of the vegetable world, called on him for an explanation. If such a circumstance was ever known to occur before, let the learned speak out.—R. L. DORR.

Dairy Husbandry.

SETTLING DIFFERENCES BETWEEN CHEESE MAKER AND PATRON.

A CORRESPONDENT writes us that a certain cheese maker of his acquaintance has had a little difficulty with his patrons about floating curds. He says:—"They go back on him $175," and we think he is not to blame, "and it is proposed to leave it to the Farmers' Club of Little Falls, or the Central Farmers' Club at Utica, and have the matter tested and settled who is responsible for floating curds—for future cases—as they do occur in all hot seasons."

This is a very good manner of settling such difficulties, and in every way preferable to carrying the matter into court, where, in all probability, each party would be mulcted for lawyers' fees and other expenses, in a sum that would more than cover the amount at issue.

Questions like this about milk and cheese making, are very readily determined by those who have had experience in handling milk and manufacturing it into cheese. Certain things in regard to the condition and treatment of milk and the manufacture of cheese are now recognized as essential to the production of a good merchantable article. No first-class cheese maker will pretend to argue that fine cheese can be made in filthy premises, with uncleaned dairy utensils, putrid rennet, and a general neglect in factory management. If the cheese maker or manager is culpable as to these matters, he ought to be held responsible for losses resulting from his want of care and mismanagement. But on the other hand, if the patrons have been careless in the treatment and handling of the milk, whereby it is delivered in a filthy and unsound condition, the cheese maker ought not to be held accountable for losses resulting from such neglect of patrons.

We are inclined to the opinion that the patrons of cheese factories do not generally appreciate, to the full extent, their responsibility in furnishing milk in good order at the factory. Many think it sufficient if they can deliver milk before it shows a perceptible change toward acidity. The milk may be reeking with filth, may be so decomposed as to be nearly, if not quite, putrid, and yet perfectly free from any acid taste or smell. Such milk is the fruitful source of floating curds, especially during hot weather. To hold that the manufacturer must handle this so as to avoid floating curds, and produce from it a cheese as perfect in flavor and quality as from milk in good, sound condition, is unreasonable, and it ought not to be expected; and yet there are a good many dairymen who will throw all the blame upon the cheese maker under such circumstances.

It is oftentimes supposed that the large attendance at the Dairymen's Conventions is made up, for the most part, of farmers who are patrons of cheese factories. This is not so. The cheese makers, the dealers, and those indirectly interested in the dairy business, are the persons who attend and make up the bulk of the audience. And it has been a great source of regret to the progressive dairymen that the farmers who are patrons of the cheese factories fail to be present at the conventions. It is this class who still remain in ignorance of many of the essential principles concerning the treatment of milk—principles which are well understood by the factory managers.

Here is another reason in favor of settling the difficulties between patron and cheese maker at a meeting of the Farmers' Clubs. Let the patrons and manufacturers come together, and have the matter fairly discussed and settled. Patrons, we apprehend, will often learn something from such discussion that will more than pay for their claims against the cheese maker. We see no reason why all the facts concerning differences between patron and cheese maker may not be presented and fairly decided at a club meeting as proposed, and an amicable settlement of these differences will be much the wiser course for both parties, than to resort to the courts.

COST OF PRODUCING MILK AT THE WEST.

THE cost of producing milk at the West is of interest to Eastern dairymen, since from this a comparative estimate may be made as to how far the West may compete with the East in furnishing dairy goods to the markets of the world. It has been supposed, and indeed is generally claimed, that milk is produced so cheaply in Illinois, Missouri, and other Western States, as to render it an easy matter for that section to compete with the East; and moreover, in the event of a large and rapid increase in dairying, the West and Northwest could compel the Eastern dairymen to retire from the field. We do not think there is cause for immediate alarm as to the over-production of dairy goods. For the last twenty years fears have been entertained that the business was being overdone, but year after year the markets have been cleared. Our population is increasing with wonderful rapidity, and the demand for milk, butter and cheese must keep pace with the growth of the country. And it is to be doubted whether the business will go beyond this point, since the moderate prices of late years are not sufficient to stimulate a rapid increase in dairying like that during the war. Hence, we think, there is not likely to be any considerable surplus of dairy goods to be carried over from one year to another.

In the foreign trade we have an outlet annually for nearly, if not quite, a hundred million pounds of cheese, at prices ranging not far from fourteen cents per pound. It is true, in the event of a war with England, our dairy interest might for the time suffer; but perhaps no more so than other leading branches of agricultural industry. But we do not think a war between the two nations is likely to happen very soon, and, therefore, can see no reason why the dairy may not be counted upon as a steady, reliable business, at about the average prices which the goods have sold the past season. Prices, doubtless, may fluctuate in different years, but the fluctuation, we apprehend, will not be caused so much from over-production of dairy goods as from pushing them too fast upon the market, or from other causes, which operate alike to depress or elevate other branches of industry.

The dairies of New York have yielded better profits this season than they did last year, for the same time, and although prices have not been so high as we could have wished, it is our opinion they will not go much lower for a series of years to come, so that those who are satisfied with the business at this year's figures may reasonably expect the dairy will pay us well in the future.

We cannot, therefore, join in the apprehension, not unfrequently expressed by some of our dairymen, that dairying at the West will very soon compel a serious decline in prices, and that New York dairymen must look for much lower rates for their goods than they have been getting this year. And in confirmation of this opinion we may refer to the statement of a writer in a recent number of the Prairie Farmer, in which the cost of producing milk in Illinois appears to be very fairly given. According to this writer the cost of producing milk is twelve and one-half cents per gallon in Summer, and eighteen cents per gallon in Winter.

Now, land is put at $65 per acre—a very moderate estimate, considering the cost of buildings, fences, etc. But we give all the figures in the estimates, that practical dairymen may judge for themselves as to the statement. Here they are:

CAPITAL INVESTED IN THE DAIRY BUSINESS.

160 acres of land at $65 per acre	$10,400.00
30 cows at $40 per head	1,200.00
3 horses at $130 each	390.00
2 farm wagons at $80 each	160.00
1 spring wagon	130.00
Horse power, feed cutter, feed mill, steamer, etc.	300.00
Plows, cultivators, harrows, etc.	75.00
1 combined reaper and mower	200.00
3 harnesses	45.00
20 milk cans	100.00
Milk pails, spades and shovels, forks, hoes, etc.	100.00
Total	$13,100.00

DR.

Interest on $13,100.00 of capital at 6 per cent.	$786.00
Loss on cows by death or accident	30.00
Loss on horses by death or accident	15.00
Wear and tear on cows	20.00
Wear and tear on horses	39.00
Wear and tear on wagons	25.00
Wear on reaper	20.00
Wear on horse power, feed cutter, etc.	30.00
Wear on plows, cultivators, etc.	7.50
Wear on harnesses	4.50
Wear on milk cans	20.00
Wear on small tools	10.00
Wear on 600 rods of fence	42.66
Wear on buildings, painting, etc.	50.00
Cost of material for repairing fence	5.00
Labor of farmer for one year	300.00
Labor of hired man for one year	250.00
Labor of hired boy for six months	60.00
Labor of hired girl one year	130.00
Board of all at $2 each per week	364.00
Feed bought in addition to what the farm produces	150.00
Insurance	30.00
Taxes	75.00
Total of Dr. account	$2,477.66
Total of Cr. account	2,250.00

CR.

By gross receipts of 30 cows, at $75 per cow, figured at the basis of 12½c. per gallon, for the six Summer months, and at 18c. per gallon for the six Winter months	$2,250.00
Loss	$227.66

Now the writer states that the above balance sheet is based on the experience in the dairy business of seventeen years, and that several prominent men to whom it has been submitted declare it to be correct, with the exception of the capital account, which in their opinion is estimated too low.

This Illinois dairyman sends his milk to Chicago for city consumption. He delivers it at the nearest depot, from whence it goes by rail to the city, and, with the exception of some extra milk cans, we do not see as the expense account would differ very much in case the milk were to be delivered at the nearest cheese factory. He makes the following additional statement, which we give in his own words, as it presents a pretty strong case, and one which milk farmers will not unfrequently recognize as coming up to their own experience. He says:

"You will see at a glance that, even at the price asked by us, the farmer comes out on the wrong side of the ledger to the tune of $227.66. Now we must, of course, deduct that from the $404 of labor, with board, charged for his service, which leaves him, the man that would command a salary of $1,000 in your city, or anywhere else, the miserable pittance of $176.34, and board himself out of that. Now, here at our station, on the C. B. & Q. road, the milk train is due at 7 o'clock and 18 minutes A. M., and, in order to get my milk properly cooled and ready for shipment in time for the train, I am obliged to rise at 4.15 Winter and Summer. I have to take it to the depot at that early hour, when in the shortest and, oftentimes, the coldest days of Winter, I cannot see a rod ahead of my team; through all kinds of weather, no matter what happens, the milk must be there on time; and nevertheless, during the seven years since I have been sending milk, I have not failed being on time but twice, and in both cases it took us half a day to shovel our way through the snow to the depot. Verily? the farmer is the beast of burden of this great nation. Between the monopolist, the carrier, the middle man and the laborer, we are having a sorry time of it. But, never mind, brother farmers, we will labor on and wait—we will right all this in the Lord's own good time."

If it be true that milk as far West as Illinois, and on comparatively cheap lands, costs the farmer 12½ cents per gallon in its production, by what manner of means can the Illinois dairyman furnish cheese delivered at the Atlantic seaboard at a price much less than 11 cents per pound? Say that the gallon of milk makes a pound of cheese, and that one and a-half cents is charged for making, furnishing and boxing, we have the 11 cents per pound for the cheese at the railroad depot nearest the factory. To this must be added the freight from Illinois to New York City. In other words the freight is against him. Again, under the present regulations of the trade, Western cheese must always sell in New York City for a less price than Eastern, even though it be of equal quality. The reason for this is because the West is so much further from the seaboard, which makes the risk greater, not only of damage but decay. A large proportion of the New York cheese is bought upon orders. On market days, at the country markets, the telegraph is in frequent requisition. The cheese is bought one day and arrives in New York on the next day. There must be certainty as to the time of its arrival, and the nearer the goods are to the city the better advantage can be taken of the markets. Especially is this the case with the foreign trade, which often sends its orders by cable, and has a controlling influence on prices.

In comparing the dairy business of the two sections, the main advantage of the West is in her cheaper lands and cheaper cows. The East generally has lands better adapted to grass—lands not so liable to be affected with drouths—better water, and being near the seaboard has the advantage in freights and the opportunity for marketing goods from time to time when prices are best. Will not these advantages on the one hand balance those on the other, and are we not justified in the conclusion that Western dairying will not increase so rapidly and to that extent that the East will soon be compelled to abandon the business? If it costs the farmer of the Northwest 12½ cents per gallon to produce milk, he will not be likely to overstock Eastern markets with cheese in order to force prices down, much, if anything, below the summer rates of 1872.

Dairying in California.—The Pacific Rural Press says:—"This important feature of California agriculture is also receiving its full share of attention; the most noted breeds of milkers suited to the varied conditions of soil and the nature of the grasses of the varied districts of valley, hill and mountain lands, are now being eagerly inquired into, with reference to their peculiar properties and adaptability each to the other, with a view of obtaining the best, and only the best, thoroughbred animals."

Scientific and Useful.

"WATER-WITCHING."

WE have a correspondent in Grand Isle Co., Vt., who takes issue with "Water-Witch" upon the subject of "Water-Witching." He not only believes there is "something in it," but "*knows* there is." He has no doubt that men abuse the credulity of those who employ them for the purpose of finding water, but insists that in the hands of some men a green forked stick will surely indicate where water runs; and that it can be successfully demonstrated to any candid scientific man, and will sooner or later become an established fact. He is anxious the RURAL NEW-YORKER should "do the cause of truth the service to convince our countrymen that it is not old fogyism nor superstition, but really an important truth." To this end he proposes to come to New York and tell where the water pipes are, every one of them, by passing over them with the stick, and trace them from one end to the other. He requires, if he does it, fair pay for his time and his expenses; if he fails, he bears his own expenses. This modest proposition is made to the RURAL NEW-YORKER, which is to undertake the expense of verifying the indications of his stick by digging up the streets and tracing the pipes. He may say that the Water Commissioners have maps of the routes of the water pipes. It may be true, but we don't happen to know it. We respectfully decline the proposition. We don't care enough about "the cause of truth" in this matter to incur the expense, time and trouble. If we wanted to dig for water somewhere, and doubted whether we could find it, we might accept the conditions for the purpose of discovering it. So others will be glad to employ him, doubtless, on the same terms. Let him advertise himself, and he will doubtless find business—especially in time of drouth. Assertions, one way or the other, amount to nothing. "Water-Witch" has asserted, no; our correspondent asserts, yes; but we do not want to be umpires in any test. Haven't time nor ambition in that direction. This ends the discussion of the topic except *facts* are introduced.

SCIENTIFIC AND USEFUL NOTES.

To Mend Mahogany or Walnut Moldings.—I found the following recipe in some paper some time ago—it may be it was in the RURAL—and have tested it and find it excellent. Please publish (or republish if it has appeared in your columns) it for the benefit of others:

Take two pieces of lumber, one to fit the inside, the other the outside of the molding (the lumber of course cut to the curves required); soak the molding in boiling water for ten minutes; then put it between the pieces of lumber; then clamp them together, slowly bending the molding; let it stand for three days, and it will be fit for use.—M. N., *Akron, O.*

Cement for Iron.—Can you tell me if there is a cement for iron? I have heard that there is.—P. N. CATON.

LOOKING through a work on mechanics we find the following given:—"Mix sixty parts of pulverized cast-iron filings with two parts of sal ammoniac and one part of flour of sulphur; and add water until a paste is formed. A cement is thus obtained which grows hot spontaneously, evolving sulphuretted hydrogen, and soon becoming very hard. Of course it must be prepared immediately before using."

Restoring Vulcanized Rubber.—JAS. MARVIN asks if there is any process by which vulcanized rubber can be restored to the condition it was before it was vulcanized, asserting that there is a fortune for the inventor of a process that shall be practical on an extended scale. We only know that it has been done, but do not know the process nor what it costs to so restore it. Do any of our readers?

Size of Field for a Half-mile Track.—A correspondent asks some of our mathematical readers to give the size of a field for a half-mile track (circular), and state what the distance should be from the center of the field to the center of the track, the track to be thirty feet wide.

Soda from Nevada.—There is a small lake in Churchill Co., Nevada, having an area of about seven acres, which is a perfect well of carbonate of soda in its almost pure state. This substance can be obtained from this reservoir to the extent of 20,000 tons a year.

Diary of a Ruralist.

DAILY RURAL LIFE.

FROM THE DIARY OF A GENTLEMAN NEAR NEW YORK CITY.

Hemlock Hedges.—*Oct.* 27.—I have just received the following letter, with a request that I should answer it in my "Diary:"

DEAR SIR:—I wish to plant a hedge of our native Hemlock. The soil is gravel, and rather stony. Should a ditch be dug, and filled with soil more congenial to the Hemlock? What size of bush, and when best, Spring or Fall? Any other information you may choose to give, will be thankfully received.—J. L., *Poultney, Vt.*

Our native Hemlock is a difficult tree to transplant from the woods and fields, and make live. Still, millions are annually removed from their native localities to others more or less congenial, and a portion of them made to grow. Fearing that the *industrial agent of the Kansas Pacific Railroad* may think that I am attempting to tell something new to Western men, as he thought I did in relating my treatment of Tulip trees, I will deny the accusation before it is made, and state that my method of handling Hemlock seedlings from the woods is very similar to, if not identical with, that of all good nurserymen. And further, in the way of showing that my practice accords with my preaching, I will state that I have a Hemlock hedge eight years planted, that will compare favorably with any living "wall of green" of its age to be found in Kansas or out of it.

In Spring, as soon as the frost is fairly out of the ground, go to the woods—but the open fields are best, if seedlings can be found there—and pull up the small seedlings; those from six to twelve inches high are usually the best and safest to transplant.

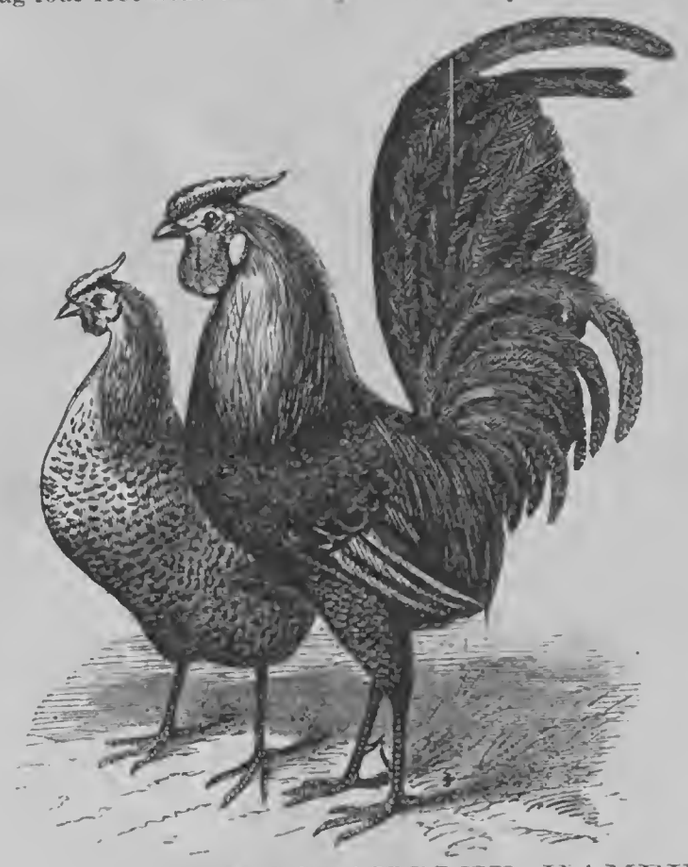
As soon as pulled up pack in boxes or into a wagon, being careful to protect the roots from the sun and wind, either with a little soil or damp moss. If they are to be transported a considerable distance, pack in boxes with moss. I do not wish to be understood as recommending the pulling of plants in preference to digging; but it can be done more rapidly, and if done in early Spring, while the soil is full of water, the roots of small seedlings will not be injured by the operation. Larger plants may be selected—say those of two or more feet high—and then cut back to one foot or a little more. If any of the smaller sized plants are tall and slender, shorten the leaders by taking several in the hand at a time and cut them off with one stroke of the knife or shears. To make good plants the branches should spring from near the ground, and pruning at the time of their first removal is often as beneficial as afterwards. The soil into which these seedlings are to be planted should be made deep and friable, but no fresh manure should be added. Plant the seedlings close together in rows; if the side branches touch all the better, and the rows need to be no further apart than will admit of a man walking between. Tread the soil firmly about the roots of each plant as it is put in; and, after all are planted, erect some kind of screen that will partially shade the plants throughout the entire day. I have had very good success by scattering hay thinly over the entire plants, and the rains during the Summer would beat it down among the plants, allowing the tops to protrude through towards Autumn. But a better way is to drive stakes at convenient distances upon which nail, or fasten in any other manner, strong poles, upon which place evergreen boughs from larger evergreens. The screen may be high enough above ground to admit of a man walking under it; in that case it must be made quite strong or it will be blown away by the wind. I usually place the screen only a few inches above the plants and not so thick as to entirely exclude the plant from light but only sufficient to give them partial shade.

This shading the plants the first season is quite important, or, I might say, almost indispensable to success. If the weather should be dry, apply water sufficient to keep the soil moist. Allow the screen to remain over the plants until the next Spring, but it will not be necessary to renew it with fresh boughs as the leaves drop off towards Autumn, because the plants that have lived until that time will be able to withstand the sunlight without injury. Keep all weeds down the second season, and by Fall the plants will be well rooted and ready for transplanting into hedge or nursery rows the following Spring. This may seem to be a tedious process, and rather a slow method of obtaining plants suitable for a hedge; but it is much more rapid than raising them from seed, and far more certain than it would be to try and make a hedge with plants direct from the woods without such preparations. If a man can afford to purchase good, strong grown plants, he will save two or more years in time.

Planting the Hedge.—Whether the soil upon which the hedge is to be grown requires trenching, manuring, or other special preparations or not, depends upon circumstances of which the planter himself should be the best judge. The soil where I planted my hedge being a light, poor sand, I had a trench dug four feet wide and two feet deep, the soil thrown out being spread over the adjoining surface. This trench was then filled with good, rich soil, taken from the woods and an old pasture. The plants have made a most vigorous growth, and last Winter, when nearly every evergreen hedge in my neighborhood was either partially or entirely killed, mine escaped unharmed, although fully exposed to the cold winds. I think the deep soil had something to do with its escape from injury. In setting out the hedge, place the plants eighteen inches to two feet apart, according to size. If they are large, nursery-grown plants, more room may be given. To make the hedge compact and give it the required shape, use the hedge shears at least once a year. I usually shear mine in Spring, and then again in August, but once shearing will answer very well for the hemlock, which, to my eye, is the best ornamental hedge plant known.

The Wild Sand or Beach Plum.—*Oct.* 28.—All along the Atlantic coast from New England to Florida, may be found dwarf species of plum known as the sand or beach plum, (*Prunus maritima.*) It can scarcely be called a tree; but in some localities it is quite a large shrub, very hardy and most prolific. The fruit is small, round, of a purplish color, sweet but not rich flavored. I have been told many times that this plum would not succeed under cultivation, or anywhere except in sandy soils near salt water. But always doubting assertions which no one appears to have verified, I obtained some plants of this beach plum several years ago, and set them in my garden where they have not only made a vigorous growth, but annually produced a full crop of fruit. Judging from my own experience with this species of plum, it would make a most excellent stock for dwarfing the stronger-growing species and varieties, and by hybridization a new and valuable race of this fruit might be produced. Our scientific horticulturists, who have been so successful in producing hybrid grapes, might find here a new field in which to exercise this skill to some purpose.

Leaves for Compost.—*Oct.* 29.—A light rain last night made the ground too wet to work readily this morning, but put the fallen leaves in splendid condition for handling, and I embraced the opportunity for cleaning up the littered lawn. Every fall I gather from ten to twenty two-horse wagon loads of leaves that fall from the large trees about my place. These leaves, with as many more as I can get time to gather from the woods, are spread over my barn-yard, where they are trampled into the manure thrown from the stables. To a Western man who knows nothing of the value of manure, or of the inconvenience of poor land, gathering leaves for manure may seem to be a waste of time; but in localities where a good two-horse wagon load of manure is worth three to five dollars, one cannot afford to allow leaves to waste. Leaves make a most excellent manure, and I find that my deposits of this kind made in my barn-yard pay me a good interest on cost. It is by saving such materials, allowing nothing to go to waste, always having some work laid out for the men to do in all kinds of weather, that we are enabled to make a living on land that costs three to five hundred dollars per acre. It is all in management whether a man makes money or loses it in farming. The locality or the price paid for the land has really little to do in the matter, because a thing usually sells for what it is worth whether it be a farm or a paper of pins.



PAIR OF GOLDEN-SPANGLED HAMBURGS.

The Poultry Yard.

GOLDEN-SPANGLED HAMBURGS.

WILL you please give, in the RURAL NEW-YORKER, an engraving and description of the pure blood Golden-Spangled Hamburg fowls, and oblige?—A SUBSCRIBER, *Hollis Center, Me., Oct.* 30.

WE republish an engraving which has hitherto appeared in the RURAL in response to this subscriber's request, and copy the following scale of points from the English Standard of Excellence, as published in the People's Practical Poultry Book, published at this office. The following is the scale of points:

COLOR OF COCK.

Comb, Face and Wattles——Rich bright red.
Deaf-ear—Opaque white.
Head—Deep reddish bay.
Hackle—Rich deep golden bay, each feather striped down the centre with rich green black, each color well defined, and not clouded.
Breast, Underpart of Body, and Thighs—Golden bay, free from mossing, streaking, or lacing, each feather ending with a round, large, rich black moon or spangle, the moons increasing in size in proportion to the size of the feather.
Back and Shoulder Coverts—Rich deep reddish bay, distinctly spangled with rich metallic black, the texture of the feather giving the spangle a starry or rayed appearance.
Saddle—Rich reddish golden bay, each feather striped down the center with rich metallic green black.
Wing Bow—Rich reddish golden bay, distinctly spangled with black.
Wing Bars—The greater and lesser wing coverts clear reddish golden bay, free from lacing, each feather ending with a large round green-black spangle, forming two distinct parallel green-black bars across the wing.
Wing Primaries—Bay, ending with black spot.
Wing Secondaries—Rich golden bay, each feather ending with a rich green-black spot.
Tail—Black.
Sickle Feathers and Tail Coverts—Rich green-black.
Legs—Slaty blue.

COLOR OF HEN.

Comb, Face and Wattles—Rich bright red.
Deaf-ear—Opaque white.
Head—Golden bay, distinctly tipped with black.
Neck—Golden bay, each feather distinctly striped down the centre with rich green-black, the colors distinct and not clouded.
Breast, Underpart of Body and Thighs—Clear golden bay, free from mossing or lacing, each feather ending with a distinct large, round, rich green-black moon or spangle, the moons increasing in size in proportion to the size of the feather.
Back, Shoulder Coverts and Rump—Rich clear golden bay, free from mossing or lacing, each feather ending with a distinct large, round, rich green-black spangle.
Wing Bow—Rich clear golden bay, each feather ending with a distinct round rich green-black spangle.
Wing Bars—Greater and lesser wing coverts rich clear golden bay, free from lacing, each feather ending with a large, round, rich, green-black spangle, forming two distinct parallel green-black bars across the wings.
Wing Primaries—Golden bay, each feather ending with a black spangle.
Wing Secondaries—Golden bay, each feather ending with a rich green-black half moon or crescent-shaped spangle, termed by the Lancashire fanciers, "lacing on the top of the wing above the flight."
Tail—Black.
Tail Coverts—Golden bay, free from mossing or lacing, each feather ending with a rich green-black spangle.
Legs—Slaty blue.

Hens in a pen to match as nearly as possible in size of markings and depth of color.

GREEN FOOD FOR FOWLS.

MR. WRIGHT, in his book on poultry, thus talks of the importance of green food to poultry that is confined:—"The last requisite in the shape of diet is a regular supply of green food. Here, again, fowls kept on grass will need no attention: but for birds penned up, the daily provision of it is an absolute necessity, though most beginners are ignorant of it. We well remember, in our own early experiences, how our fowls died, we could not, at first, tell why; and one fine Buff Cochin cock, whose only fault was a strong vulture hock, was in particular greatly regretted. An experienced friend let us into the secret, and after that we had no difficulty in keeping fowls, even where it is often said they cannot be kept in health—viz., in a yard paved with large flag stones. The best substitute for natural grass is a large, fresh turf, thrown in daily, to each four or five hens; and even in towns it is often possible to procure this, by giving children a few pence every week to keep up a regular supply. Where turf is not allowed to be taken, grass may be cut or pulled, but in this case must be cut into green chaff with shears or a chaff machine. The latter plan is how we actually managed for years, in a yard only sixty-seven by thirty-five feet, divided into six pens; paying some child a few pence to bring fresh-cut grass daily, cutting it up and mixing it with their soft meat."

POULTRY NOTES AND QUERIES.

Feather-Eating Pullets.—In answer to an inquiry, an English writer in Cottage Gardener says:—"We believe it arises, in the first place, from a disordered condition of body, the bird seeking for something it cannot find. While engaged in the search, a bare spot on a bird is seen and pecked at directly. Every bird, even a dove, is carnivorous, and as soon as the skin is removed, and blood is seen, they go to work *con amore*, and will not leave off. Our cure has always been to remove the birds with bare spots till the feathers were grown. When they return in full plumage they are safe. It is often the work of one hen, and if she is removed the nuisance ceases. We believe the habit becomes a second nature, and the cannibal becomes a fowl eater. We should not, therefore, ever allow the peccant hen to return to the walk. We have found benefit only from one treatment, which is a copious supply of lettuces, especially if they are going to seed. The best treatment for the bare spots is to rub them often and freely with sulphur ointment."

What Ails my Chickens?—I have Black Spanish fowls. Since last Winter they have been troubled with sore eyes. The soreness on the eye forms into yellow matter. It does not stop until the eye is gone. Sometimes it will take both eyes. This matter has a very bad smell. The disease don't affect all of them, but I lose about one or two of them in a month. My hen house is 14x20 feet. I have got a stove in it, and on cold days last Winter I kept fire. I kept last Winter fifty fowls. If the RURAL NEW-YORKER or any of its readers can tell me the cause and a remedy for this trouble, it would very much oblige.—F. J. W., *Adrian, Mich.*

To Get Plenty of Fresh Eggs, a poulterer recommends feeding a mixture composed of five parts of bran to one of middlings—wetting up about four quarts in the morning in a large tin pan, taking pains to have it rather dry, though all damp. Just enough is mixed for the fowls to last the day through, it standing accessible to them all the while. Just before sundown a light feed of corn is given, and eggs are abundant.

Chicken Cholera.—A correspondent asks us to give a remedy *we know* to be effective. We have had no experience with the disease, and, therefore, do not *know* what is effective; but on page 43, RURAL NEW-YORKER, July 20, we gave a remedy by W. H. FEVOR, Mechanicstown, Md., which he says proved of great service in his neighborhood. Our correspondent is referred to it.

Floricultural.

MARANTA SEEMANNI.

THE plant herewith illustrated is a native of Central America and was sent to England as a Maranta by Dr. BERTHOLD SEEMANN, after whom it is named; but some of the English florists think it has too much the appearance of a dwarf-growing *Heliconia* to be a *Maranta*. If it is a *Heliconia*, EXPERTO CREDE, in Cottage Gardener, says "It may produce conspicuous and ornamental flower-bracts in addition to the fine foliage. Be it, however, *Maranta* or *Heliconia*, the fact remains that it is very beautiful and thoroughly distinct; I certainly look upon it as amongst the best new plants of the present season. The leaves are ovate-acuminate, some 12 inches long by about 6 inches in breadth; on the upper side they are of an intense deep satiny-green, having a light midrib, whilst the under side is of a deep vinous red, affording a pleasing contrast. *Maranta Seemanni* is not, strictly speaking, a variegated plant, yet it possesses so much beauty that even amongst *Marantas*, which are so numerous and so beautifully marked, it cannot but occupy a leading position. This plant thrives admirably under the same treatment as the other *Marantas;* it delights in strong heat and moisture, and should be potted in a compost consisting of good peat, a little loam and sand. The drainage of the pots must be kept in good order, for although it likes an abundant supply of moisture, water must not be allowed to become sour around its roots.

MARANTA SEEMANNI.

ROSE MALLOW.

INCLOSED with this find flower, leaf and seed vessel of a plant which you will oblige me by naming. The plant in question is a perennial; grows to the hight of four or five feet, and is hardy—enduring the coldest winters without protection. The flowers are produced at the ends of the shoots which spring from the root each year, and are of a beautiful pink color. Another variety has white flowers with a crimson-maroon center. Time of blooming is August.—MORT PERKINS, *Woodcock, Pa.*

THE plant is the quite common Rose Mallow; (*Hibiscus Moscheutos*), which usually grows abundantly in brackish marshes. It also succeeds well when cultivated as a garden plant; and by growing seedlings any number of varieties can be produced. There are several native species varying in form of leaf as well as in size and color of flowers. The bark on the stems of all the herbaceous species is very tough and might be utilized for making cloth, cordage or paper.

The Okra or Gumbo (*Hibiscus esculentus*) and the Manihot (*H. Manihot*), are both well known members of this genus. The Rose of Sharon of our gardens (*H-Syriacus*) is the most common representative of those species that have woody stems. The Mallow family is quite a large one and it includes cotton, the *Abutilon*, so extensively cultivated as a greenhouse plant, *Malva*, the Hollyhock, and many other familiar plants. A close inspection of the flowers will enable almost any person to determine their relationship; as all are similar in structure and form, although varying greatly in size and color.

FLORICULTURAL NOTES.

Hyacinths for Late Flowering.—The Cottage Gardener of Oct. 17 says:—We consider the end of this or beginning of next month as late as it is desirable to pot Hyacinths for a late bloom, but they may be potted in December. After potting, plunge the pots in coal ashes in a north aspect, and cover them with three inches of old tan or cocoa-nut refuse. Put over them a frame or spare light to throw off the wet. In this way they may remain six weeks without further attention, but if the weather be severe they must have a covering of mats or other material, to protect them from frost. This must be removed in mild weather. After six weeks the pots should be taken out, placed under lights, and merely protected from frost. You may keep them in this position until March, when they should be removed to a cold pit or frame. Place them not more than 15 inches from the glass, admit air very freely in mild weather, protect from frost, and the bulbs will not bloom until April. If you wish them later than that, keep them in a north aspect, giving plenty of air and light, so as to prevent them from becoming drawn.

Hyacinths in Glasses.—In answer to a question, the Cottage Gardener of Oct. 17 says:—The bulbs may be placed in glasses now, though it is not well to begin too soon. We consider it well to keep the bulbs for a week in damp moss or sand, then place them in the glasses, the water at first barely touching the base of the bulb; then put them in a dark closet until they have roots an inch long. Two drops of spirits of hartshorn may be added to the water, and a piece of charcoal when the plants are growing. They may be placed near the light after the roots are an inch long, and may have a temperature of 50° to 55°, but one of 45° to 50° insures stronger blooms.

Smilax Culture.—Please tell me, does Smilax need a hot or cool temperature? Is it to be kept moist or dry?—ADDIE APPLEY.

SMILAX succeeds best in a moderately warm room, but not too hot or dry. Give sufficient water to keep the soil moist, but not soaking wet all the time. While plants are growing rapidly, they require a liberal supply of moisture. As the vines begin to die and the leaves to turn brown, withhold the water and allow the bulbs to ripen, after which they may be divided or left together until Autumn; then divide and put into fresh soil, when they will soon commence growing again. Any one who has grown other tender house plants successfully, should succeed with Smilax.

Saving Marigold Seeds.—Seeds of French and African Marigolds may be harvested some time before they are ripe. I had some excellent plants of French Marigolds of good form, and producing fine flowers, and being anxious to procure some seeds of them, on the approach of the late frosts I picked off several heads, but found none of the seeds ripe. I kept them, however, for a few days and sowed some in a pot which I placed in a gentle heat, just by way of experiment, and, to my surprise, I have been rewarded with a numerous progeny of young Marigolds.—W.

Wintering Roses in Pots in a Cold Room.—The Gardener's Monthly reports a florist who winters the tenderest roses in pots in a house without any fire, though the temperature goes below zero and the plants most of the time are frozen solid. The secret is in watering as regularly as through the Summer,

The Herdsman.

ALLEN'S HISTORY OF SHORT-HORNS.

AMERICAN breeders of Short-Horn cattle have now the history of this breed—origin, progress and present condition—available, prepared by Hon. LEWIS F. ALLEN, Buffalo, N. Y. It is a volume of 266 pages, similar in size and style to the American Herd-Book, edited by Mr. ALLEN. That this volume will settle all disputes with reference to families, etc., or that it is devoid of errors Mr. ALLEN does not pretend; but it is his contribution to this class of literature, and a valuable and interesting contribution it will be found by all breeders of Short-Horn stock. It is prepared as a labor of love, chiefly—the author expecting no profit from it—because he became convinced from the number and character of the inquiries made of him, as editor of the Herd-Book, that this breed of cattle should have as full a history as could be given of their race. He has been able to correct some errors and to gather much information, comparatively new, through the kindness of correspondents. The book is illustrated with ten portraits of representative animals at different dates in the progress of this breed. Part First is devoted to the origin and English history of the breed; Part Second to the first and subsequent importations to this country, their distribution and improvement. It is a compend of all, probably, that is worth knowing concerning the general history and distribution of this breed in this country, and no man who is making the breeding of Short-Horns a specialty can afford to do without it.

TO ESTIMATE THE WEIGHT OF LIVE CATTLE.

ARE there any rules that are reliable relative to estimating the weight of cattle alive by the aid of measurement? If any of your Western readers who are dealers in live stock can give any rule, practically tested, which may be relied upon as reasonably accurate, they will confer a favor upon —A CONNECTICUT FARMER.

THE following rule is generally accepted, we believe, as nearly accurate by English cattle dealers, and has been adopted in some localities in this country, where animals could not be weighed:

First, see that the animal stands square; then, with a string, take his circumference just behind the shoulder-blade, and measure the feet and inches—this is the girth. Then measure from the bone of the tail which plumbs the line with the hinder part of the buttock, and direct the string along the back to the fore part of the shoulder-blade, and this will be the length. Then work the figures thus:—Suppose girth of bullock 6 feet 4 inches, length, 5 feet 3 inches, which, multiplied together, make 33 square superficial feet, and these, multiplied by 23—the number of pounds allowed for each superficial foot of cattle measuring less than seven and more than five feet in girth—make 759 lbs. When the animal measures less than nine and more than seven feet in girth, 31 is the number of pounds to be estimated for each superficial foot. And suppose a small animal to measure 2 feet in girth and 2 feet in length, these multiplied together make 4 feet, which multiplied by eleven—the number of pounds allowed for each square foot when the cattle measure less than three feet in girth—make 44 pounds. Again, suppose a calf, or sheep, etc., to measure 4 feet 6 inches in girth, and 3 feet 9 inches in length; that, multiplied together, makes 16 square feet, and these multiplied by 16—the number of pounds allowed for cattle measuring less than 5 and more than 3 feet in girth—make 256 lbs. The dimensions in girth and length of the back of cattle, sheep, calves, and hogs, taken this way, are as exact as is at all necessary for common computation or valuation of stock, and will answer to the four quarters of the animal, sinking the offal. A deduction must be made for the animals half fat, of one pound in twenty from those that are fat; and for a cow that has had calves, one pound must be allowed in addition to one for not being fat, upon every twenty.

NOTES FOR HERDSMEN.

J. H. Pickerell's Sale of Short-Horns.—October 24th, J. H. PICKERELL, Harristown, Ill., held his annual sale of Short-Horn cattle and other stock, which we judge (from a private note from him) proved very successful. We make the following extract from his letter:—"I sold ten bulls, one to three years, for $1,050; one two years—own breeding—for $3,000, being $1,150 more than any bull ever sold for that had been bred in Illinois; eight bull calves averaged $340 each. The cows and heifers sold from $150 to $1,700; one yearling for $800; one for $1,100 and one just turned two years, for $1,310. The ten bulls averaged $677 each; twenty-nine cows and heifers, $583.10—the whole, $607.12. Forty-seven Berkshire pigs sold at from $7 to $76 each—averaged $23. Twenty-eight Southdown sheep sold at from $8 to $38 each—averaged $18.53. The whole—some stock not in catalogue included—sold for $26,408.

In-and-In Breeding.—During a discussion of this subject in England, not long since, it was asserted that the most successful lines of Short-Horns were those in which one animal was the sire of the sire and of the dam also—thus making the parents half brother and sister by the same sire out of different dams. This system of breeding had produced some of the finest cattle in the country. It was also said that where cattle were closely in-bred and preserved their constitution, they had a tendency to lose color, save perhaps the ears, and to become whiter.

A Lame Steer.—Can you, or any of your numerous readers, tell me what ails my steer and what will cure him? He is five years old, and was in pasture in Pocahontas Co., W. Va., and in June he took a kind of reeling, and soon his hind legs below the knees swelled smartly, and he cannot step on his feet well, but generally steps on his pastern joints with his foot to the rear. He is poor; if he were fat, he would weigh 1,500 lbs.—G. W. S., *Swoope's Depot, Augusta Co., Va.*

A Disease Afflicting Calves and Two-Year-Olds is thus described by G. W. SNIDER:—"The first that I ever noticed it was a loss of the use of one or more legs by the animal, and in less than twenty-four hours the animal attacked is dead. On skinning it, we found a place on or adjoining the affected leg, which is all in a blubber of black blood. When I was a boy, we always burned one and salted the others with the ashes; but now we mix salt and ashes to stop it."

"Black Leg" in Cattle.—A correspondent asks if there is any cure for "black leg" in cattle. We have often heard of "black leg," but we confess we do not know anything about a disease with that name, and wish those familiar with, would describe it.

Domestic Economy.

HYGIENIC COOKING.

It is gratifying to those who make it their life-long study to teach mankind temperance in *all* things, to see the interest taken by the Rural New-Yorker to promote wholesome, nutritious and delicious preparation of food; and we hope to see the subject agitated until the $125,000,000 now placed in the hands of physicians because of our sinful indulgence—in a great measure—shall be reduced to one-tenth of that amount.

With fifteen years hard-earned experience in cooking for invalids, we think we can place upon our table any delicacy of the day prepared so palatably and harmlessly any one may partake with pleasure, and without injury. This we consider a boon to the dyspeptic almost as valuable as his existence.

We do not expect every one to succeed in becoming perfect in their first attempt to follow these recipes; yet when we consider the vast necessity of repeated trial, and have the assurance that they are in no way inferior—to a healthy palate—to the method of putting in eggs and butter to be cooked from half an hour to two hours (and which if cooked alone without the sugar-coating and placed before us would be considered an insult) our duty, as humane beings, impels us to a thorough investigation. If successful, we aid in staying the tide of intemperance in eating, that to-day produces more injury to mankind than all the excess of indulgence in spirituous drinks, large as the victory appears. But I proceed to give you a bill of fare at once digestible and sufficiently palatable for any.

Christmas Dinner.—Roast Turkey:—Dressing made of stale white bread, pouring enough hot water over it to moisten and steam it thoroughly, after which add enough sweet cream and salt to make pleasant to the taste.

Fruit Cake:—Sift the desired amount of Graham flour with a coarse sieve, using one teaspoonful of baking powder to one quart of the flour, adding sugar in proportion to the size of the cake to be made and richness desired, with salt to take off the freshness, and raisins, chopped figs, dates, or prunes of sufficient quantity; after which, mix the whole with cream enough to make a batter as thick as can conveniently be thoroughly stirred with a spoon.

The pie crust sought after by Julia Colman, in Rural New-Yorker of Dec. 23, 1871, can be made very fine and lighter than with white flour and lard, besides being perfectly digestible and palatable, by taking one teaspoonful of baking powder to one quart of sifted Graham flour, mixed up with sweet cream to a much thinner consistency than white flour dough, and rolled out in the usual manner.

Excellent pumpkin pie may be made without eggs by using one tablespoonful of cream in the place of an egg, and proceeding otherwise in the accustomed manner.

Very fine biscuit can also be made by mixing milk or cream with Graham flour and kneading well; the more, the better they are. These receipts all require a very hot oven in cooking. No farmer need have the excuse that cream cannot be obtained; and if others who think they cannot indulge in the luxury, would try the experiment in connection with plain living, they would find their expenses *really curtailed* by the reduction of their doctor's bills.

To complete our dinner, vegetables should abound! Such fruits as apples, figs, pine-apples, raisins, prunes, &c., may be eaten with impunity. These receipts are worthy of trial, especially by those who have poor digestion. R.

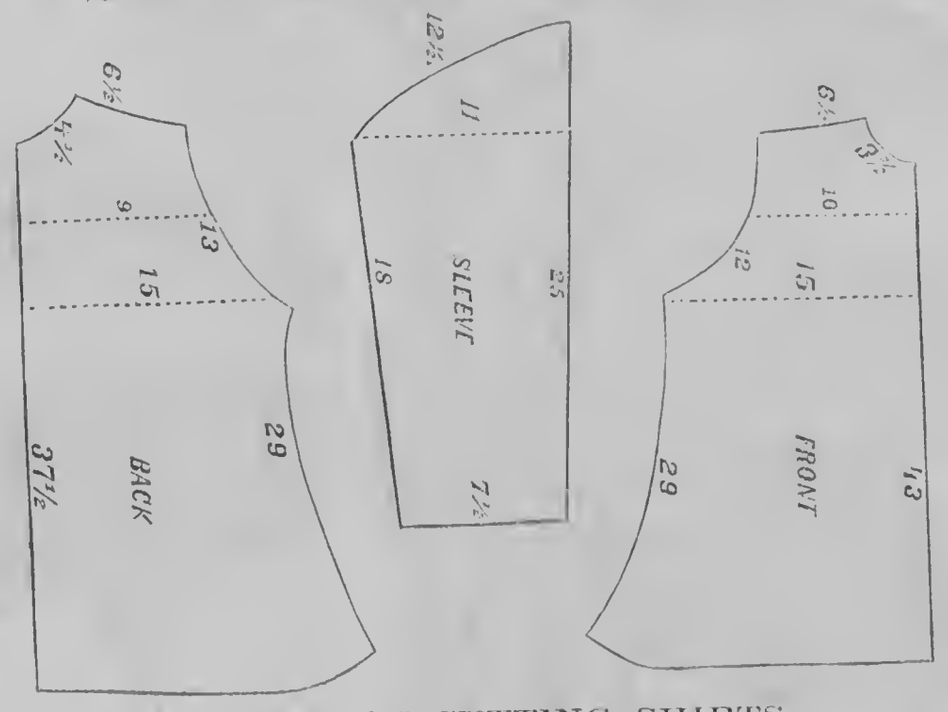
ODDS AND ENDS.

Bleaching Beeswax.—I saw a notice in the Rural New-Yorker about selling white beeswax; will some one of your readers please inform me the process of bleaching it.—A Subscriber.

As long ago as 1860, Mrs. M. K., Lynn, Pa., gave the following modes, which we republish for the benefit of our correspondent and other inquirers:—Take the cleanest beeswax you can obtain, melt it in hot water, skim it out into a cup or basin previously oiled; when quite cold, cut the wax into thin slices; expose these to the action of the sun and air, upon white dishes, sprinkling it, unless there be rain, once or twice each day with clean water. At the end of a week, melt the wax again, and proceed as before. In hot weather, the wax may be floated on water in the middle of the day.

Another way is to melt the wax in a deep dish—a quart measure will do—place it in a kettle of hot water when melted, have a straight pestle, previously wet; dip the pestle in the melted wax, the same as you would dip a candle; take a large pin, or needle, cut the wax into sheets, pin on a white cloth, and expose to the sun and air as above directed. This last is a good way to bleach in small quantities.

Chow-Chow.—In reply to Julia A. Powell's request for a receipe for Chow-Chow, I send the following, which I know to be very good:—One bushel of green tomatoes, chopped fine; sprinkle with salt and let them stand over night; then drain off the water, put them over the fire and



METHOD OF CUTTING SHIRTS.

scald them in vinegar until tender; then draw it off; add one quart of green peppers chopped fine; one quart of horse radish, grated: one teacup of white mustard seed, pounded fine; one ounce of ground cinnamon; eight large onions, chopped fine; a few cloves, and about one tablespoonful of garlic, chopped fine; mix the ingredients; put them in a jar and cover with hot vinegar.—B. C. Utley.

Half a bushel of green tomatoes, one dozen onions, chopped together; put in a pint of salt; let them stand over night; put them in a cullender to drain out the brine, then cover with good vinegar and cook slowly half an hour; then drain them and put them in a jar. Make a preparation of two pounds sugar, one quart good vinegar, one pint grated horseradish, two tablespoonfuls ground cinnamon, one of allspice, one of cloves, half a teacup of ground mustard; boil this up and stir it through the tomatoes while hot; while cooking, when nearly done, put in half a dozen or more peppers (according to size) chopped fine; green ones are the best. If Julia A. Powell will try the above recipe I think she will pronounce it excellent. If onions are disliked, they can be omitted; and if, as is the case in our family, allspice is also disliked, that can be left out, and it is *very* good. We like it better if cooked until done, which takes one hour.—T. O. E., *Millport, N. Y.*

Tomato Catsup.—In response to the request of Emma J. N., in regard to "a good recipe for making tomato catsup," I send one which I think cannot fail to meet approval. To make one-half gallon:—One gallon of skinned tomatoes, two tablespoonfuls of salt, three tablespoonfuls of mustard, one-half tablespoonful of cloves, one tablespoonful of allspice, one single handful of horseradish, and one quart of sharp vinegar; stew in a tin vessel four or five hours; then strain, bottle and seal closely. The removal of the seeds is entirely optional.—C. C. C., *Phelps, N. Y.*

To Cut Shirts that will Fit.—Sometime ago a lady asked through the Rural New-Yorker for a method of cutting shirts so they would fit well. I have a pattern that never fails to fit nicely; cut very plain without plait or gather. I send a diagram of it. The figures represent inches. —Mrs. Martha E. Rogers.

Pies Running Over.—How many cooks are troubled with their pies running over. I have found the cause is baking too fast on the bottom; and if I cannot regulate my oven, I slip a piece of tin under them. Custard and pumpkin pies often puff up, with air under the crust, from the same cause.—Mrs. L. Jennings.

Pomological.

PRESERVING FRUIT IN WINTER.

The following method of keeping peaches, apricots and pears has, according to M. Miot, proved quite successful, and is thus described by him in the *Revue Horticole*: The fruits are gathered before quite ripe and wrapped up separately in pieces of well-sized tissue paper. They are then placed in tin boxes, which are divided into compartments, one for each fruit. The lid is kept closed by lapping a piece of wire round the box, and the air is excluded by melting bottle wax round the edge. The boxes are then laid in a large wooden chest, raised about six inches from the ground on four feet. The bottom of the chest contains a layer of powdered charcoal a foot deep, on which rests a wooden frame-work of pigeon-holes, each about four inches larger in diameter than the tin boxes, the frame-work itself having a space of ten inches between it and the sides of the chest, which is filled up with powdered charcoal. The tin boxes containing the fruit having been deposited in the pigeon-holes, the whole is covered with powdered charcoal to the depth of a foot. There is thus at all points a layer of charcoal ten inches or twelve inches thick between the tin boxes and the external air. The chest is closed with a well-fitting lid and placed in a cellar with a constant temperature of from 35 to 45 Fahr. By this means peaches and apricots have been kept perfectly fresh up to the first of January, and Doyenne and Beurre pears up to the beginning of March. The only precautions necessary to be observed are that the fruit should be gathered before they are quite ripe, that they should be carefully wrapped up, without rubbing them, in dry and well-sized tissue paper, that the tin boxes should be wiped perfectly dry, and that the fruit should be placed in them within twenty-four hours after the gathering. The only expense is in the first outlay, as the charcoal can be dried and used again the following season.

POMOLOGICAL GOSSIP.

Peaches Reproducing Themselves from Seed.—Referring to the statement made at the Farmers' Club that members knew of no variety of peach that invariably reproduces itself from seed, Mr. Flagg writes the Prairie Farmer:—"Perhaps there is none such, yet of a hundred seedlings of the Columbia that we grew ourselves, we do not find one that is not possessed of all the characteristics of that very variety. They even vary but little in time of ripening, color and size. Besides this, the Heath Cling, Smock, Indian Blood Cling, and Late Serrate, (a local variety of our own,) all produce seedlings that are identical, or very nearly so, with their parents; but we know of no such conclusive testimony regarding them as we are able to give in relation to the Columbia."

Van Buren's Golden Dwarf Peach.—The American Rural Home, Oct. 28, has the following:—A few years ago quite a sensation was excited in the horticultural world by the introduction of the above peach. The interest did not attach to the *fruit* so much as to the *tree*, as on account of its dwarf habit, it was said that it could be easily protected from the severity of the Winter. We believe that it amounted to but little, practically, and that no one made a fortune by raising fruit of that variety. We have just tested a specimen—the first we ever saw, and find it quite a large oblong peach, shaped and pointed like the Crawford's Early; of a dull yellowish green color; flesh deep yellow; rather insipid; ripe the middle of October. It is a cling, and would be hardly tolerable, if ripening early in the season when good peaches abound. The specimen was handed in by William Smith, formerly office boy in the Rural New-Yorker office, when that paper was published in this city. The tree upon which it was grown was one of several sent by Mr. Van Buren to the Rural New-Yorker about five years ago, and was the only one, we are informed, that survived and bore fruit. It is evidently a Southern peach, and may be of some value there, but is of none here.

Blood-leaved Peach.—The Gardener's Monthly describes and illustrates this peach, and says of it:—"The variety was found on the battle field of Fort Donelson, in Kentucky, and the Southern papers tell that a Southern general, wounded to death, sucked the juice of a peach, and threw the stone into the little pool of his blood by the side of him, from which sprang this tree with blood like leaves." Mr. Berckmans, in the Rural Carolinian, thus describes it:—"In the early portion of the year its foliage is of a deep blood-red color, but gradually fades as the weather becomes warmer, when it assumes a dull green appearance. Fruit medium, slightly oblong, somewhat flattened; skin white, with a pale red wart, and a few pale red spots or stripes; flesh white, juicy, well-flavored; clingstone; ripens beginning to middle of August. We would class it as very good in flavor, but deficient in size." The Gardener's Monthly says it ripens in Philadelphia the last of September, and that when making second growth in August, the leaves are nearly as brilliant as in Spring.

Newtown Pippin Apple.—In the Rural New-Yorker of Oct. 26, it is stated by Dr. Howsley, at the Farmers' Club, that he could find no origin for the Green Newtown Pippin. Well, what of it? I can name a hundred or more varieties of which no origin can be given. Does that prove that there are no such apples? He also says "the green (so-called) pippin was always yellow when ripe." I never saw one yellow, but pale green or greenish yellow; it keeps longer, not as firm in flesh, but more crisp, juicy and higher flavored. Friend Fuller stated that "he believes the Green Newtown Pippin to have originated in some nurseryman's catalogue." It may be so; yet it is doubtful if any regular catalogues (except advertising sheets) were published at that early date; and Coxe, in his work on Fruits, etc., which was published in 1817, gives descriptions and outlines of both the yellow and green Newtown Pippins; and I well recollect at that time they were always considered two distinct varieties.—Chas. Downing.

Peasgood's Nonesuch Apple is the name of a new English apple attracting attention. The Cottage Gardener says: This handsome Apple was presented before the Fruit Committee of the Royal Horticultural Society on September 18th, and received a first class certificate. It was raised by Mr. Peasgood of Stamford, and is one of the most handsome Autumn apples in cultivation.

The fruit is like a very large Nonesuch, and not unlike a well-grown and highly colored Blenheim Pippin. It is above the medium size, roundish, and somewhat oblate. The skin is yellow, overspread on the sunny side with red, which is copiously streaked with dark crimson streaks. The eye is very large and open, set in a deep, round, and even basin, and with short depauperated segments. Stalk short, deeply inserted. Flesh yellowish, tender, very juicy, with a sweet and sprightly flavor and pleasant aroma. It is a valuable culinary apple, and not unworthy of the dessert.

Apple for Name.—Alanson Lester sends us a very poor though handsome apple for name. Charles Downing happened in the office while we were scanning it, and said he did not know it; of course we did not.

The Bryant Pear is a seedling of the White Doyenne, from Wm. Cullen Bryant's place on Long Island. Tree vigorous, hardy; fruit very good, slightly astringent; season, end of September. It is to be put on the market, but no trees are to be had now.

The Literary World.

NEW PUBLICATIONS.

California: for Health, Pleasure and Residence. A book for Travelers and Settlers.—By CHARLES NORDHOFF. New York: Harper & Brothers.

LESS than a year ago Mr. NORDHOFF made a tour of California, writing articles for Harper's Magazine, the Tribune and the Post. The large and handsome volume before us is a result of this tour; a splendid volume of 255 broad pages, illustrated with 58 fine engravings of natural scenery. Mr. NORDHOFF's style is smooth and easy—his book reads like a charming story, and is filled with facts of all sorts gleaned by the way. He was delighted with everything he saw in California; its people, climate, productions and resources. Like a true newspaper man he knows how to write for the public. Travelers and settlers will find this book to be valuable in more senses than one. He writes of farming, semi-tropical fruits, wheat, cheap farms for the million, irrigation, beet-sugar, silk, wine-growing, sheep-farming, cattle ranchos, etc. These are subjects of interest to all of our readers.

The Polytechnic: A Collection of Music for Schools, Classes and Clubs.—New York: J. W. Schermerhorn & Co.

WE take it as a good thing, and a help to several other good things, that so much attention is now paid to musical culture. For school use there has been much music published that was of little use except in schools, but this very beautiful book seems to be adapted for use in the family quite as well as in the school. It has many operatic selections, the words adapted to which have been carefully edited, a selection of college songs, and a small selection of sacred music—making altogether the fullest and handsomest book of school music we have lately seen.

The Athenæum: A Collection of Part Songs for Ladies Voices.—New York: J. W. Schermerhorn & Co.

MADE up of music of a more elaborate style than the preceding book, it has the same typographic beauty, and equal care and taste in selection and harmonizing. It will be a favorite in the social circle and the concert room, for several of the more beautiful pieces are not easily accessible elsewhere.

Wonders of the Moon.—Translated from the French of Amedee Guillemin. Edited by Prof. Maria Mitchell of Vassar College, N. Y. New York: Scribner, Armstrong & Co.

WE regard this as one of the most interesting volumes of the illustrated library of wonders yet issued. The book is well adapted for popular reading, is scientific in its facts, and beautifully illustrated. The enigma of the celestial sphinx is solved in this volume, and those who would conquer the moon should read it. Miss MITCHELL has edited the book with ability, explaining all difficult points.

The Lawrence Speaker.—A selection of Literary Gems in poetry and prose. By PHILIP LAWRENCE. Philadelphia: T. B. Peterson & Brothers. Price $2.

A LARGE, handsome volume of 600 pages, containing the finest productions of authors known to fame. The selections range from SHAKSPEARE to THEODORE TILTON and BRET HARTE. All students who have occasion to declaim will find what they seek in this volume.

The Gift of the Knees; or, the Ministry of Prayer the Ministry of Power.—American Tract Society.

THE subject of Prayer, since Prof. TYNDALL'S proposed "Prayer Gauge," is exciting some attention. This book attempts to exalt the mission of prayer and its power, as a vital every-day necessity. It contains three good religious tales about prayer.

The Outcast; and other poems.—By J. W. WATSON. Philadelphia: T. B. Peterson & Brothers.

THE volume before us is a beautiful one, in morocco cloth, gilt; price $2. Mr. WATSON is an earnest, pathetic writer and claims to have written a popular poem called "Beautiful Snow." Many readers will find much which is pleasing in this volume.

Spanish Self-Taught.—By FRANZ THIMM. New York: Dick & Fitzgerald.

A HANDSOME 25 cent pamphlet, of 80 pages, on a new system of the most simple principles. The book is for universal self-tuition, and we judge it to be as good a hand-book of the language as any published.

The Lady of Lyndon.—By LADY BLAKE. Boston: Jas. R. Osgood. 1872.

A LOVE story of English life, in which Lords and Ladies figure. It is written with freedom and ease, and will interest the lovers of light fiction.

OUR PREMIUMS APPRECIATED.

THAT strangers may know that the Premiums given those forming clubs for the RURAL NEW-YORKER are first-class, we publish below extracts from a few of hundreds of similar letters received from Club Agents. All our regular Agents understand that the articles offered are Genuine and Valuable, (and generally say in their acknowledgments that the Premiums are better than represented or expected,) but we want those now asked to form clubs (including YOU, Reader,) to also know that very Important Fact. Hence we invite special attention to the following Emphatic Testimony. *Read, then Act:*—that is, Get up a Club, and thus secure a Valuable Premium:

W. A. HART, P. M., Friendship, N. Y., sends (under date of Aug. 9, 1872,) this handsome and hearty acknowledgment:—"The Smith American Organ, for obtaining subscribers for the model paper, "RURAL NEW-YORKER, arrived safely something over thirty days ago. It is truly beautiful in finish and richness of tone; surpasses my expectations and is greatly admired by all the family. This is certainly receiving 'Good Pay for Doing Good.' Please accept my sincere and *hearty* thanks."

C. W. HENNETT, Branch Co., Mich., writes:—"The Weed 'Family Favorite' Sewing Machine was received all safe and sound, with only one dollar express charges. We have been trying it, and though my wife is not used to running a machine, she has already become able to do good work with it, and it certainly will be a 'Family Favorite.' Please accept sincere thanks, with the assurance that what I have already done is only a *beginning* of what I expect to do for the RURAL in future."

C. C. PEET, Ottawa Co., O., writes:—"Please accept our grateful acknowledgements for the premium (Webster's Unabridged Dictionary), which we have this day received. It is truly a *prize*, and *more* than meets our expectations in print and style of binding. Our testimony will only corroborate with hundreds of others regarding your liberality in offering premiums and the promptness you display in forwarding to all your Agents. Truly we may say it is 'Good Pay for Doing Good.' Permit us to make a low bow and thank you."

C. R. FRANKLIN, Broome Co., N. Y., sends a note which brings the tears to our eyes. He writes:—"I desire to express to you my deep sense of gratitude for the Watch. It came just in time for my *dying wife* to present it to our oldest boy as a Birth-Day Gift, with the request that he should always keep it. In connection with a dying mother's gift, your kindness and liberality will be remembered. *God bless you*, is my earnest prayer."

Master J. L. MCMILLAN, Washington Co., N. Y., is good to his mother. He writes:—"I thank you for the promptness with which you sent my premium for the first list of subscribers. I am a twelve year old boy, but the *Forks are a nice present for Mother*; and now I am trying to get something for myself. Please credit these names as an addition to my club."

F. N. CHASE, Publisher of the Binghamton Times, writes:—"The United States Watch sent by you as premium for 10 subscribers to RURAL NEW-YORKER was safely received. It seems, to be a reliable time-keeper, and is an elegant looking watch. The Sewing Machine received last year is true to its name—a 'Family Favorite.'"

MISS FLORA L. SILLIMAN, Huron Co., O., writes:—"I am happy to inform you that I have received both Premiums, all right—the Engraving (Birth-Day Morning) to-night and the Cake Basket last night. I am very much pleased with them. We all think they are very beautiful. I am perfectly satisfied, and very much obliged."

H. D. JAMES, Columbia Co., Wis., writes:—"Please accept my thanks for the Premiums you have sent on. The Watch is a splendid time-piece, and the Chain is much better than I expected. I think I am well paid for my time and trouble in raising a Club for the RURAL, and shall continue to do what I can for your paper."

MISS MARY A. LEONARD, Orleans Co., N. Y., writes: "I feel well paid for the effort of obtaining subscribers. I have received the Clothes Wringer in good order. I am highly pleased with it, and return you many thanks for the favor. I intend to continue my effort in behalf of the RURAL."

J. C. WRIGHT, Licking Co., O., writes:—"Accept my grateful thanks for the Silver-plated Tuning Forks, which were duly received and give entire satisfaction. I know, of a truth, that it is 'Good Pay for Doing Good.' Am in the field for a new Club, with a fair start in new subscribers."

C. E. CLARK, Trumbull Co., O., writes:—"I was very happily disappointed when I received Webster's Unabridged Dictionary as a present for getting up a club for your RURAL. It was much better than I expected. You can count on me at an early date for the Campaign of 1873."

Miss C. D. HARRIS, Seneca Co., N. Y., writes:—"The Cake Basket and Fruit Stand were received in good order. We are very much pleased with both, but especially the fruit stand; it is indeed beautiful. Please accept thanks, with many wishes for your prosperity."

H. N. BROWN, Lucas Co., Ohio, writes:—"I received the Castor sent us Premium for the RURAL Club, and was happily disappointed, it was so much nicer than I expected. I am amply rewarded for my trouble, and thank you six dozen times besides."

A. WIEBUSCH & SON, Steam Printers and Binders, St. Louis, to whom we recently sent a copy of our Steel Plate Engraving, respond thus: "Your Premium is decidedly the best of all we have yet seen, and is admired very much by all who see it."

FRANK BROWN, Broome Co., N. Y., writes:—"The Shopping Bag you sent me as premium is all I supposed it to be. I like the style of RURAL NEW-YORKER better now than before, although last year I thought it could not be surpassed."

G. R. CHANDALL, St. Lawrence Co., N. Y., writes: "I received the Spoons in due time, and they are all right—perfect beauties. Please accept the thanks of our daughter for the beautiful Shopping Bag, and of my wife for the nice Spoons."

JOSEPHUS HOOF, Delaware Co., Ohio, writes:—"The Bible came to hand all right, last evening. Am very much pleased with it. Think it is just *Splendid*. Accept thanks of self and family for your liberality in this and other things."

C. L. FREEMAN, Madison Co., N. Y., writes:—"Please accept my best acknowledgements in behalf of the 'Continental Washing Machine,' which has been received, and is pronounced the best by those who have tried it."

HENRY KEELER, Saratoga Co., N. Y., writes:—"The Premium Watch and Chain have both arrived safely and I am much pleased with both. Please accept my thanks and expect to hear from me again next year."

B. C. BULLOCK, Chautauqua Co., N. Y., writes:—"The Album sent me as a prize was duly received, and I think it very nice. It *certainly* repays me for the trouble I have been to in getting up the club."

D. POST, Allegany Co., N. Y., writes:—"I received the Watch you sent me as a premium last week. It is a beauty. Please accept many thanks. I will do all I can to help the RURAL NEW-YORKER."

W. B. CLARK, Chehalis Co., Wash. Ter., writes:—"I have received your Premium (Double Plated Spoons) in good order, and they are of a fine quality. Please accept my thanks."

MISS MAY A. SAYLE, Bradford Co., Pa., writes:—"I received the Watch this morning. Accept thanks for the same. It pays well for time spent in the service of the RURAL."

Miss SUSIE KILLAM, Fairfax Co., Va., writes:—"I received my Premiums this morning, all right, and I am writing this with the Gold Pen. It is very good. Please accept thanks."

"GOOD PAY FOR DOING GOOD!"

LIBERAL PREMIUMS TO CLUB AGENTS!

MOORE'S RURAL STILL AHEAD

In Liberality to both Agents and Subscribers!

READ, LEARN AND ACT!

THE RURAL NEW-YORKER'S Agent-Friends, and everybody disposed to become such, all over the Continent, will please note the following announcement of UNPRECEDENTED PREMIUMS for both Club Agents and Subscribers:

Observe, firstly, that we give every Yearly Subscriber who pays $2.50 a Splendid STEEL-PLATE ENGRAVING. This *Grand Premium* is sent to every person paying $2.50 for the RURAL one year—so that each subscriber at that price really gets $7.50 for only $2.50! Note, particularly, that the offer will enable you to raise a Club with much greater ease and facility than ever before.

Note, secondly, the annexed list of VERY LIBERAL PREMIUMS offered those who form Clubs for 1873, or for one year from any date. See the Names and Prices of Articles, and the small number of Subscribers required to secure a Valuable Premium. Almost any one located in a locality where live, reading people reside, can, by a little timely effort, secure a Premium worth from $5 to $200. *Now is the Best Time to Start Clubs*, for now that the Presidential Campaign is over everybody will want such a good, useful and popular paper as MOORE'S RURAL.

Remember, thirdly, that every article we offer as a Premium is *First-Class and Genuine*—that we put each at lowest retail price, and that the names of manufacturers or dealers (given in most cases) is a guarantee of good quality, etc. Note, also, that all Club Subscribers—whether at $2 for the paper only, or $2.50 for Paper and Engraving—can be counted by Agents for Premiums.

The Table below specifies the Cash Price of each article offered as a Premium, and the number of subscribers required to secure it at $2, (our lowest club rate)—or at $2.50 with our Premium Engraving. Note that the Premiums are offered *without any condition as to whether the clubs are composed of new or old subscribers.* Canada subscribers must add 20 cents per yearly copy for postage.

SPECIFIC PREMIUMS,

TERMS, &c. FOR MOORE'S RURAL NEW-YORKER FOR 1873.

OPEN TO EVERYBODY.

SATURDAY, NOV. 16, 1872.

"BOSTON BURNING."

Such was the cry of the newsboys through our streets all day Sunday; such the exclamations of citizens to each other, accompanied with the remark, "Another Chicago." But, bad as it is—and we give the gist of the facts and a map of the burned district on another page—it is not "another Chicago." It has burned out a section of the most substantially built part of the city—occupied by wealthy firms whose ability to withstand and recover from such losses is ample. Few homes, comparatively, have been burned, and there are not 100,000 people without shelter.

But we are not underrating this terrible calamity to Boston. Thousands of people will be thrown out of employment; the effects of the fire go beyond the homes of those who have suffered direct losses. It will cause a pang about many hearthstones where the daily food is born of daily labor. It should and will awaken the sympathies of all citizens, as did the Chicago fire of a year ago. It will stir up the better impulses of those who have plenty, to aid those who have a long and bleak New England winter before them with an almost hopeless prospect of employment. Wealthy as Boston is, and able as she is to recover from this destruction, it cannot be hoped that her own poor will be too tenderly cared for; and every one who can should help his brethren in distress.

ISOLATION OF FARMERS.

ONE important bar to agricultural progress in this country is the voluntary isolation of farmers and lack of neighborhood co-operation. Perhaps no class of Americans, who see so little of it, are better informed as to events transpiring in the outside world; but this knowledge is not rendered available and operative, because there is too frequently no association on the part of farmers for utilizing it. Then this isolation makes men distrustful of each other. Co-operation seems impracticable, nay, impossible, to the farmer whose world is the boundaries of his farm, and whose social relations are limited by his own family, his immediate relatives, his blacksmith, storekeeper, postmaster, shoemaker and brethren in the church, and whose social duties are discharged in a way best indicated by the relations named. It is common for such men to get a morbid idea that every man is his enemy, trying to overreach him, and to be watched as such.

This is all wrong. The colonizing of farmers into villages for social purposes whence to radiate daily on to their farms, is recommended as a means of correcting the evil. We do not regard it as an effectual corrective. On the contrary, it may result in social evils still worse. Economically viewed, such colonization would be a direct loss to every farmer. It is far easier for farmers to leave their respective homes to meet each other once or twice a week, than to be compelled to do the daily travel which such colonization would involve. But there is no good excuse for the isolation which obtains in too many agricultural districts. Farmers should meet each other regularly—at least once a week. This gathering together will be not only of social, but of pecuniary advantage. Let us sum up some of the advantages we conceive would grow out of, say, a Farmers' Exchange in a neighborhood, once in seven days:

1. Farmers thus brought together will talk upon topics which interest them; they will exchange opinions and detail to each other their practices; thus the wisdom of each becomes the common capital of the whole. The ideas that the most intelligent may have, and the projects conceived as likely to benefit the whole neighborhood, if put in operation, are forced upon the attention and discussed by each individual interested.

2. Thought begets thought. The discussion of any measure in which the interests of a neighborhood, or class, are involved, results in a critical examination of that measure and in suggestions by all interested. Thus, co-operation may result, by which the entire neighborhood, or class, may profit. An idea is of no value unless it is used. A spade may be a good one, but utterly valueless until some one comes along to dig with it. The isolated farmer, sitting by his fireside, may evolve plans and projects that, if executed, would increase the value of his own and his neighbors' property twenty-five or more per cent.; but so long as the plan and project remain where they originated, they are inoperative and void. He needs his neighbors' co-operation, and to get it must communicate with them. He must force others to think as he does, or allow them to modify his plans until they are perfect, and secure their aid in carrying them out.

3. Such association is a stimulus greatly needed by the farmer. It begets a spirit more in accord with that which is operative in other branches of business. It begets enterprise. It forces observation. It renders a man more critical and analytical, because what he learns and imparts he knows will be subjected to critical analysis by his fellows. It makes him more charitable and subordinate and less egotistic; because he learns, much to his astonishment sometimes, that there are other people in the world as smart as he is; and he also learns a still more important lesson, *to wit*: that his neighbors are as kindly disposed, charitable, honest and accommodating as he is.

4. And finally, we urge effort to break up this isolation this Winter. The long evenings are at hand. One a week will not be unprofitably spent if farmers and their wives will only meet for social and business purposes. Farmers' Clubs, Granges of Patrons of Husbandry, or simply neighborhood sociables, without any formality whatever, if organized, will break up this isolation which rusts those who indulge in it, and by friction will polish and brighten life on a farm to such a degree as few who have not witnessed its effects can dream of. Even the social effects of such gatherings, provided no practical co-operation is attempted, will render the life of the farmer and his family vastly better, more tolerable and elevated.

RURAL NOTES AND QUERIES

"An Insufferable Nuisance."—In a recent issue of the RURAL NEW-YORKER, in a report of the proceedings of the Farmers' Club, noticing the talk of a Kansas gentleman before the Club, we said:

Dr. STAYMAN spoke of the fruit-producing resources of Kansas in the highest terms, having, to back his statements, fruit actually produced in that new State. There is no doubt about the resources of Kansas; so little doubt is there that to outsiders who are not interested in Kansas lands, or those of any other State, this eternal advertising of Western lands (at the Club meetings we wished it understood) has become an insufferable nuisance.

This remark has aroused the Editor of the Kansas Farmer, who perpetrates a column article upon it as a text, the point of which, so far as it relates to this journal, falls to the ground when we state that we referred only to members of the Farmers' Club who are not interested in land sales, as the "outsiders" who regard this species of "ax-grinding" in the Farmers' Club an insufferable nuisance. Kansas is not to blame for using the Club's grindstone whenever it gets a chance; but the fact is a large proportion of the Club's time the past three years has been consumed in listening to letters or speeches advertising some locality where somebody has land for sale; and, so far as the West is concerned, each successive speech or letter is mainly but a rehearsal of what has been said or written before; and members have got tired of listening to, and the papers of printing, such letters and speeches. The biggest joke our Kansas contemporary ever conceived is that involved in a remark suggesting that the RURAL NEW-YORKER is jealous of Kansas! It's a joke that ought to be patented at once, neighbor!

Annual Stock Sales are becoming important features of modern American husbandry. Sales of horses, cattle, sheep and swine are now held by nearly all the prominent breeders of these classes of animals, and many who have not been known as "prominent breeders," are attaining a national reputation through the advertising such sales. The advantages are manifest. Not only is the stock sold generally, but it is sold at home. Those who attend such sales go for the purpose of buying, and prepared to pay for what they purchase. They are judges of stock. They can see the stock they are bred from, and judge of the manner in which it has been kept. The testimony of the breeder's neighbors is available as to his own trustworthiness. They know, therefore, what they purchase, and no risk of dissatisfaction between buyer and seller is taken—as is too often the case when stock is ordered and forwarded, the buyer trusting to the seller's judgment and the validity of his warranty. Nor does the seller take the risk always involved in shipping, even if C. O. D., resulting from the carelessness of expressmen or the mishaps often attending transportation. He delivers his stock to the purchaser at home, and is paid for it without further risk. There is every reason, therefore, to commend and encourage this mode of disposing of stock. Where one breeder in a neighborhood has not stock enough to warrant such an enterprise, two, three, or more may combine; and finally we may expect to hear, as in England, regular stock-market Fairs in every important stock growing district.

French Exposition of Insects.—From Oct. 1 to Oct. 15 there was, in Paris, under the patronage of the Minister of Agriculture and Commerce, an exhibition of useful insects and their products, and of noxious insects and their ravages, organized by the Central Society of Agriculture. It comprised collections of silkworms of all species, with samples of silk, raw and twisted, or chewed, with apparatus and fixtures for cultivating the silkworm: apparatus and fixtures used in agriculture, and the products of bees, both in a crude and manufactured state, also formed a portion of the exposition; collections of noxious insects, with contrivances for their destruction; collections of auxiliary insects, or insects that assist in the destruction of noxious insects; and collections of insectivorous mammifers, birds, and reptiles formed a third feature. This same idea, in a more modest and personal way, has been developed at some of our State Fairs by one or two practical entomologists; but it never received the encouragement its importance deserved. The work of entomologists, however, in this country should be rendered as practical and educational in its influence as possible; and the exhibition or arrangement of insects in public and school museums should be made with this view. The Paris exposition suggests the method we would be glad to see generally adopted.

Japan and American Short-Horns.—Do our readers know what a field is opening in this country for Short-Horn breeders? We say opening. It is already open. No breeder that we know of who has made a specialty of any one breed of stock, and pursued it with integrity and intelligence, but has made a fortune at it. Japan has been importing Short-Horns from Illinois; England from Canada, New York and Kentucky. The recent sales of this class of stock, and the prices obtained, show how highly they are valued. The field is a great one for a young farmer. Begin moderately, and within your means. Post yourself thoroughly as to the history and character of the breed; fix upon a standard of excellence to be reached; comprehend the true theory of breeding, and master the practical details, and success is sure. This answers the questions of "Young Breeder," P. W. F., and C. S. K.—young men who want to know what we "think of the future of Short-Horns in this country." We think the field has only begun to be occupied.

Cost of Establishing Granges of Patrons of Husbandry.—The Grand Deputy of the National Grange of Patrons of Husbandry has been talking with the Editor of the Western Farmer, who says:—"As there has been some confusion in statements as to the cost of establishing Granges, Mr. ABNOTT makes the following statement:—There must be at least 30 charter members, one-third of whom may be women. The fees for these are $3 for the men and fifty cents for the women. To the National Grange $15 is paid, to the Deputy such sum as may be fixed by the State Grange; in Iowa he receives $5 a day for the necessary time spent, and his expenses. For all members subsequent to this the fee is $5 for men and $2 for women. There are some additional expenses for regalia, blanks, cards, etc., but these are not very great. The cost of establishing a Grange of 100 members—70 men and 30 women—would probably not exceed $400."

Shipping Cotton Direct from Wilmington, N. C.—The Wilmington papers are congratulating the people of the South upon direct shipments of cotton from that port, which is justifiable. But we hope to live long enough to know that not a pound of cotton unmanufactured is shipped from this country, but that it is all consumed by American mills, operated by people who will help make a home market for our food products and thus keep the money in the country which now goes abroad to pay foreign labor.

The Foot-and-Mouth Disease among cattle in some counties of England is decreasing, while in others it is seriously increasing. There is reason for continued vigilance on the part of those who may desire to import stock.

THE SEASON, CROPS, PRICES, ETC.

Crowland, Ont., Nov. 6.—Have had a very dry Summer and Fall thus far, with only an occasional light shower since the 13th of last June, when we had very heavy showers. Crops in general are turning out badly. Fall wheat averages 8 to 15 bushels per acre, but in some instances a yield of about 20 bushels per acre is reported; oats, from 15 to 20 bushels; barley, not much sown; potatoes, generally a very poor crop; corn, only middling, very little planted; field beans, also a light crop on account of dry weather. Prices:—Wheat, red Fall, $1.18@1.20—white, $1.22@1.25; oats, 40c.; potatoes, 45@50c.; corn in ear, 30c.—shelled, 65@70c.; beans, $1@1.12 in retailing them a few here and there; peas, 62½c.—G. O. P.

Liberty, Union Co., Ind., Nov. 1.—The weather for the past two months has been most delightful for doing the Fall work. The past Summer has been exceedingly warm and dry. Wheat hardly half crop; oats heavy; hay tolerably good; corn good in some fields, while in others it was almost entirely destroyed by the grubs. The growing wheat has not made as poor a show for many years, fly and grubs killing it entirely. Corn, 40c.; wheat, $1.40; hogs, 4c. per lb.; cattle, 4@5c. per lb.; wages on the farm, $1 per day. Business lively.—W. L.

St. Charles, Ill., Nov. 1.—Very fine weather for doing up Fall work. Wages for hired help high; corn and oats cheap; water for stock scarce; hay, $10 per ton; cows, $25; horses, $100 to $300; hogs, $4@5 per cwt.; cheese, 15c.; butter, 25c.; eggs, 25c.; other things in proportion.—H. H.

RURAL BREVITIES.

THE hop crop of 1872 is estimated to be 14,000,000 lbs., or 70,000 bales.

MRS. J. H. should address B. K. BLISS & SONS, New York City, for the information she seeks.

L. M. ASKS where repairs for the "Little Giant Corn Mill" can be obtained. We do not know.

THE Plantation, heretofore a weekly, published at Atlanta, Ga., has become a handsome monthly.

THE farmers of Virginia and adjoining North Carolina, are to hold a convention at Petersburg, Va., Nov. 27.

DR. H. A. SWASEY'S connection with the Rural Southland has expired by limitation, and he has published his valedictory as Horticultural Editor.

IN the RURAL of Nov. 2, some type dropped out, and the address in Advertisement of W. GORHAM'S Linen Marker was rendered somewhat indefinite. It should have been, 12 School St., Boston.

MR. C. A. SHERMAN, of the Oberlin Telegraph Institute, complains that in our late notice we misstated the average number of his pupils, and added unnecessary letters to his name. We hasten to apologise. How these errors arise is one of those things "no fellow can find out."

PUBLISHER'S NOTICES.

TO EVERY READER!

HINTS, REQUESTS, SUGGESTIONS, ETC.

"Our Premiums Appreciated."—All disposed to form Clubs for the RURAL NEW-YORKER will please read column under above heading, on preceding page—wherein many Club Agents tell about the Value and Beauty of our Premiums. Also see our revised Premium List on same page.

"Progress and Improvement."—MOORE'S RURAL for 1873 will be better than ever before, in both CONTENTS AND STYLE. It will appear in a NEW DRESS of Clear and Beautiful Copper-Faced Type, and present other **Decided Improvements.** Agents and subscribers will please note this, and if they tell their friends, so much the better.

The Premium Picture is sent to All who pay $2.50 for a copy of the RURAL one year, and *not to those who only pay the club rate.* Club subscribers can secure the Engraving, however, by adding 50 cts. to the usual club price ($2.) Don't forget this.

Begin Clubs Now!—And to all who want the paper from date, or either one year (at $2.50) or 15 months (at $3) from Oct. 1, we will send the paper accordingly, with Premium Engraving post-paid. The whole club can start at one time, or part Jan. 1st and part earlier. Note this fact.

The Campaign Opened!—Many Agents have already opened the RURAL Campaign for 1873, while hosts are sending for Specimens, &c., probably with the view of starting on Election Day (a good time, by the way,) or soon after. All right, friends!—That's the way to win Premiums easy.

BUSINESS NOTICES.

HORSE EPIDEMIC.

A PHYSICIAN in a communication to a Buffalo paper about the Horse Epidemic, says:—"Externally I used and would recommend Dr. Trask's Magnetic Ointment to the throat, around the ears and on the forehead. This ointment contains tobacco and lobelia, and operates upon the mucous glands of the head and throat by causing an increased flow of secretion from them, at the same time by its relaxing effect removing the stricture and giving almost instant relief to the cough and breathing." It is kept by all Druggists.

THE WAKEFIELD EARTH CLOSET.

Get Descriptive Pamphlet at 36 Dey St., New York

Modes and Manners.

COSTUMES ILLUSTRATED.

THE illustration we give this week is of a costume more especially designed for home wear. The material may be cashmere *drap d'ete*, alpaca or satin. The underskirt is trimmed with Kilt plaiting of two shades, which is very pretty when the shades are well selected. We would advise, however, that they be of one shade, and suggest alternate Kilt plaits and bias ruffles, two each. The belted polonaise is the feature of the dress as it is of most costumes this season. It is cut very loose. In the back the width of the cloth is laid in large box plaits at the waist. It may be draped to suit the taste. The trimming is a Kilt plait, but bias folds; fringe, ruffles or lace may be used as the taste of the wearer may dictate. The collar is a wide sailor, finished with the trimming. With a bright tie, and a suspension of ruffle or lace in the neck, this costume is universally becoming. It is destined to be very popular because so much easier to fit than other styles of polonaise. A bright bow in the hair completes the costume.

The child's dress in the engraving is of light-blue cashmere, vandyked and bound with blue velvet. The over-dress is made with revers, and is cut out in the neck over a waist of puffs and Valenciennes inserting. The hat is of blue velvet, with a blue feather.

Out-Door Wraps.

For ordinary out-door wear the belted polonaise is the prevailing style. It commends itself by its comfort, convenience and general adaptability. The material most popular is camel's hair cloth. It is a yard and a-half wide, and costs $3, $5 and $6 a yard. That at $3 is mixed; the others are pure wool. It wears well, is very warm, and can be worn in all Winter weathers. The colors are gray and light browns. The stores have largely imported these polonaises which are embroidered with wool in showy patterns. These cost from $50 to $100. Much prettier, however, are those trimmed with Yak lace, of the same shade. These may be made very elegant by an inserting of the lace. They are wadded and lined about the waist and confined with a silk cord and tassel, an embroidered belt, or, what is better, a Russia leather belt.

These polonaises made in the cheapest manner of camel's hair cloth, are still expensive; but they look very well in Cashmere, serge cloth, or what is known as ladies' cloth. These offer greater choice in color, and are very pretty. We have seen one in dark mixed ladies' cloth, double-breasted and trimmed with black, which was very stylish.

Black Cashmere sacks embroidered, braided and trimmed with Yak lace, are still very fashionable. The sack, with large cape slashed in the back, and trimmed with inserting and edge of lace, is exceedingly pretty. These may be made warm enough to be worn all Winter. For some cloaks are in colors, but they are worn chiefly by young girls. The most popular of them is dark blue cloth, half tight in the back, double-breasted in front, trimmed with facing of black silk edged with white cord.

Velvet cloaks are in all shapes, and elaborately trimmed. Gimps, mixed with jet, are in form once more; but lace has still the preference. Guipure is greatly used. Old cloaks can be easily made to answer every purpose by slashing the back, freshened by new trimming. The prettiest contrasts are obtained with handsome gros grain trimming, and a gros grain belt and sash.

Prevailing Colors, Trimmings and Styles.

THIS season the depth of one's purse has very little to do with one's ability to be in the fashion. Given the information and the average amount of womanly tact, and every woman can compass a fashionable and becoming costume.

The colors which last year made a successful break among the prevailing blacks, are this year pre-eminent. They defy description, but can be referred to the dun and dusky shades of November leaves now strewing the woods, and to the metallic hues of bugs and insects. There are greenish blues called peacock shades; there are greenish blues and yellowish green, called bronze, and a light green called sage, which is very lovely and popular; in addition, there are the plums, purples, smokes, olive brown, and gray shades of last year. These shades come in all materials. A good quality of satin may be bought for 50 cents; substantial serges from 50 cents to $1.25; Cashmere from $1.25 to $2.50; French poplins for 75 cents and $1; Irish poplins, of very good quality, for $1.50; silks of every quality, from $2 and upwards; an exquisite fabric, called Cachemire Sicilienne, for $5, and so on, up to embossed velvets and brocaded gros grains for $15.

Trimmings.

The most popular trimmings are velvet and fringe. Every color has now its trimming to match velvets; they come in every shade, and are cut on the bias; they form the richest of all trimmings and are generally used. Fringes have never appeared in greater variety. A very handsome article is called crape fringe, which is sold from $1 to $1.75. It is something similar to the crimped fringe of last year in effect, but is still richer. The plain silk fringes are now made more elegant, with elaborate headings, and interspersed with silk balls. For trimming worsted dresses, there is a very pretty article of worsted fringe, which is sold at 35 and 40 cents. A new lace called Yak, has almost superseded guipure, though it is by no means so handsome. It is said to wear well, and is very stylish on heavy dresses. An inserting comes with the lace, which is very handsome in outer garments, especially the loose-belted Polonaise of heavy cloths, now very much worn. In using this lace, it is best to buy the lace and purchase the dress to match it. The price of the lace depends on the color. The dark blues are the cheapest, costing 65 cents. Rich gimps are still used for trimming; they come in very handsome designs, but are not so popular as formerly. Many trimmings are made out of the dress goods; but this is not to be recommended, neither in the score of beauty nor economy. Most dress-makers charge extra for made trimmings, and only experienced hands can make them neatly. It seems poor policy, too, to cut up material for such purposes when the same money would buy fringe, lace or gimp, which only needs to be sewed on, and can be used afterward in other ways.

How to Make Your Dress.

One thing we can assert positively, dresses are not to be so fantastic as formerly. It will not do to pile your trimming on in characterless masses. Every costume must have its meaning. Flounces are universal. They are not very deep, and the most unique are trimmed with a ruffle, or bound with velvet or satin and festooned. A very popular skirt is made with four flounces on the back and a flounced apron in front. Wide square sashes fasten the apron on the back. Kilt plaits, that is side plaits, are not quite so much worn; they are still, heavy, and require so much material. They can be simulated, however, by running a seam on the under side. A small lower flounce is invariably placed on the bottom of the skirt. The flounce immediately above is generally about ten inches in depth. Occasionally gathered flounces and Kilt plaits alternate. Many skirts are flounced with alternate shades on a skirt of the darker, finished with a short overskirt, the lighter shade scalloped and bound. These dresses should not be attempted except by competent dressmakers, as the entire effect is produced by a knowledge of the requisite shades.

The one feature of the waist is the long square vest, which is the favorite style this season. Vests are universally introduced in one form or another. They may be simulated by the trimming, or made of silk or velvet. The velvet vests are particularly elegant. Basques are more worn than last season. They are much more becoming to most persons than the polonaise. The latter has lost its sloping back entirely; all fullness is gathered on to the waist in large plaits, and buttons or jet ornaments substituted for bows. Sleeves are in coat form, ending often with a ruffle at the wrist, but made with a revers when attached to a corsage with a vest.

Black silk dresses are still in favor. For persons who do not have many costumes they are indispensable. For evening wear they are lightened by vests of white muslin over a color. They are extremely pretty. Black bows lined with a color and left raw at the edges may be disposed about the dress with good effect.

LATE FALL COSTUMES.

ANSWERS TO CORRESPONDENTS.

Suits for a Bride.

LAURIE H.—Brown gros grain seems rather old for a bride of twenty. Instead get a sage green, a bronze, or some of the shades now fashionable, either of which will be suitable at any other time. Make the skirt demi-train; trim with a small, bias ruffle, or straight ruffle plaited around the bottom of the skirt; above that put a deeper bias ruffle, with two standing ruffles and a quilling of silk for the heading. Make the overdress with a short, apron front gathered high on the sides. We would not use white lace for trimming, unless it is handsome; it is not suitable for silk. Instead, use fringe, the same shade. Let the back of the overdress be long, full, and drape prettily. Make a basque-waist and trim with ruffles, as you find them becoming to your figure. Catch the sleeves below the elbow in a double box-plait, with a bow of the silk which will form the ruffle. In wearing this dress, afterward, select gloves in a lighter shade of the same color.

For your traveling outfit a skirt of French poplin would be the most suitable, trimmed with velvet of a darker shade. For a polonaise the Louis Quinze is the most suitable. This is buttoned half way down the front, has large pockets, trimmed with velvet, and large, square pockets in the back. Still more serviceable would be a redingote of camel's hair cloth, as described elsewhere. Let your hat be a felt, a darker shade than of your dress, trimmed with velvet; a feather or wing, as you prefer. Your gloves should be of the same shade as your dress.

FLORENCE of B.—"Young misses of sixteen," unless they are very precocious, are not expected to go to opera in full dress. A light hat, your best cloak, a pretty ruffle around your neck and light gloves of at least two buttons, constitute a costume always suitable. The color of your costume depends upon your general appearance. Among the most fashionable colors are plums, dark-blues, blue-greens, yellow-greens, sage-greens, olive and chestnut browns. If you are a blonde we suggest plum, and worn with a pale-blue tie. If you are a brunette, dark-blue and scarlet tie. For material Cashmere is the handsomest, next *drap d'ete*, serge, satin or Empress cloth. The best books on etiquette can be bought for $1.50 and $1.75. They are the Bazar Book of Etiquette and Manners Among men, by an English Countess. Either may be obtained by remitting the price to this office.

MATS FOR TOILET SETS.—In making mats for wash-stands and bureau, are there not two different sets? So asks EDNA. Yes, if she chooses. In making such mats, size is governed by taste rather than rule.

THE OLD MAN.

BY BEN DOUGLAS.

Behold him standing at thy door,
A life-wrecked, faint and trembling man;
His locks are gray, his cheeks are pale,
His spirit-strength and hope are gone—
His days are narrowing to a span.

His wants are known, he asks for bread,
And shelter from the winds and rain;
O, treat him kindly, take him in,
And at thy hearth-stone give him room,
Let not his plea be made in vain.

In that old house of trembling bones
Some crushed but noble soul may dwell;
Great sorrows may have pierced his heart,—
Misfortune may have bowed his head,—
His weight of sadness none may tell.

O, treat him kindly—gently speak!
Who knows the griefs which wound him so!
And one kind look, or whispered word,
May cheer his heart, that, sea-shell like,
Breathes but a monotone of woe.

Remember, he's a brother still,
And needs thy friendly aid to-day,
More than when 'neath a father's roof,—
More than when youth was on his brow,—
More than when first he went astray.

Life's road to him is hard and long,
Poor pilgrim wanderer with us here;
No friend, no arm, no place of rest,—
For him no love-encircled home—
No kiss of welcome, and no tear.

Once his was wealth, and strength, and hope,—
His story heed and him sustain;
Too many frowns may make a grave,
But smiles that old heart yet may thrill,
And make it dream of love again.

A band of brothers all are we,
All destined to the self-same goal;
So kindly help and cheer him on,
And if he falls, be his support,
And make his broken spirit whole.

Bind up his bruised and bleeding heart,
But few his days of strife and care:
Faith points the Old Man's soul to Heaven,
Where riches may be unforgiven—
No *earth-rule* will exclude him there.

Wooster, Ohio.

Our Story-Teller.

HOW SHALL I GET THROUGH?

BY MRS. M. F. BUTTS.

The morning was very hot and Mrs. Brown rose late. The baby was fretful, the children were disobedient, and Mr. Brown found fault. It seemed as if breakfast never would be ready. The distance from the pantry to the stove was never so long, so many things never needed doing at one time before, and when at last Mrs. Brown tied the baby in his high chair and seated herself alongside the coffee pot, she had a splitting headache and a general feeling of despondency and lassitude almost impossible to bear. "How shall I ever get through this day?" she asked herself, mentally, as the "men folks" straggled carelessly in and took their places at the table.

"Mother, said Mr. Brown, "we must have breakfast in better season. We've been waiting a full half hour."

Mrs. Brown said nothing, but poured out the coffee, and prepared some bread and milk for the baby in silence. Nobody noticed that she ate no breakfast, so busy were they all in disposing of the cold corned beef, the delicious brown bread and mealy potatoes, and in talking of the wall they were going to run through the east meadow before night. They were not long in eating, and men and boys shoved their chairs back from the table and went out, leaving the mother with the breakfast dishes, the "milk things," the sweeping, the dinner, the baby, and various other delicate bits of work not necessary to mention. Out into the fresh air and through the daisied meadows went the men, laughing and talking gaily; in the hot kitchen sat the woman surrounded with her monotonous work.

Wearily Mrs. Brown rose from the table, took the baby from his chair and put him in his cradle, surrounding him with the clothespins, the dinner horn, and such other utensils as he couldn't injure; then she turned to the task of dish-washing. She had carried part of the dishes to the sink, when baby screamed. He had fallen out of his cradle in reaching after something he had dropped, and, frightened and hurt, he loudly demanded his mother's attention. There were tears of thorough discouragement in Mrs. Brown's eyes when she took up the child and began soothing him by walking up and down the room.

"How shall I get through to-day?" she asked herself again; and a succession of just such days arose in the future, each one asking her "How will you get through me?" and "How will you get through me?" till she felt ready to give up the conflict and never try again. While she walked up and down, brooding and forlorn, a fresh, bright, determined-looking little woman walked in at the door. It was Mrs. Hart, the wife of the new minister.

"Don't mind me, Mrs. Brown," she said, taking off her hat. "I've come over to help you. Don't say one word," as the housekeeper attempted to remonstrate. "I'm going to wash these dishes, and I want you to sit down and get baby to sleep while I do it. Then we'll have a little talk."

Mrs. Brown yielded, as everybody yielded, to the persevering woman, who went at the half-cleared table as if it were a fortress to be taken. In a surprisingly short space of time every dish was shining high and dry on the pantry shelves, the sink was clean and dry and the dish-cloths floated like banners from the lilac bush at the back door.

"There, now," said Mrs. Hart, seating herself triumphantly, "wasn't that quickly done?"

"You have some spirit," said poor, pale Mrs. Brown. "It hasn't all been dragged out of you by hard work."

"Pre-ci-se-ly," said Mrs. Hart; "that's just the point I want to talk to you about. The wife and mother who lets herself be used up so that she has no spirit to put into her duties, commits a great wrong against herself and every one connected with her."

Mrs. Brown looked up in amazement, mingled with resentment.

"I know you think you're doing right," continued the intrepid little preacher, "but I know that you are fatally mistaken. Your first duty is to keep your soul and body in a healthy condition; unless you do that you must utterly fail in all other duties."

"But I cannot, with all this work."

"You ought not to attempt to do all this work. That is the first error."

"I can't help it."

"I beg your pardon, dear Mrs. Brown, but you can help it. You could have a good girl in a week if you should use the power in your hands. Nobody has the right to make you overwork yourself. If you act as a true woman should, a woman who respects herself as a child of God, as the mother of children, in whom is reposed a sacred trust, you will not overwork yourself. You will hire a servant for the servant's place, and save your energies for their proper use. In the course you are taking now, you run every day the risk of depriving your children of their mother. Can you afford to do this?

Mrs. Brown's eyes began to flash. "You are right," she said.

Mrs. Hart laughed. "I knew you were of the true stuff, or I shouldn't have undertaken you. Some women are born to be drudges. Let such fulfill their destiny; but let no woman capable of being a real wife and mother, dare to destroy these functions with a servant's work. There are cases where overwork is inevitable; but these cases are the rare exceptions in our prosperous country."

Mrs. Hart stayed all day, and the minister came over and took dinner with them. Mrs. Brown "got through" very nicely, and in less than a fortnight a stout-armed servant was installed in the farm kitchen. Mr. Brown was as much the gainer as his wife, and fell in love over again with the fresh, happy, neatly-dressed woman who presided at his table; and as for the little Browns, they had a mother, and not a tired, dispirited drudge to scold and mold them; and this statement tells its own story.

THE ONE DOLLAR BILL.

How it did rain that November night! None of your undecided showers, with hesitating intervals, as it were, between; none of your mild, persistent patterings on the roof, but a regular tempest, a wild deluge, a rush of arrowy drops and a thunder of opening floods!

Squire Partlet heard the angry rattle against the casements, and drew his snug easy chair a little closer to the fire—a great open mass of glimmering anthracite, and gazed with a sort of sleepy, reflective satisfaction at the crimson moreen curtains, and the gray cat fast asleep on the hearth, and the canary bird rolled into a drowsy ball of yellow on its perch.

"This is snug," quoth the Squire. "I'm glad I had that leaky spot fixed in the barn roof last week. I don't object to a stormy night once in a while, when a fellow's under cover, and there's nothing particular to be done, Mary.

"Yes," Mrs. Partlet answered. She was flitabout between kitchen and sitting room, with a blue check apron tied around her waist.

"I'm nearly ready to come in now, Josiah. Now I wonder," *sotto voce*, "if that was really a knock at the door, or just a little rush of the wind and rain?"

She went to the door, nevertheless; and a minute or two afterwards she went to her husband's chair.

"Joe, dear, it's Luke Ruddilove," she said, half apprehensively. The Squire never looked up from his paper.

"Tell him he's made a mistake. The tavern is on the corner beyond.

"But he wants to know if you will lend him a dollar!" said Mrs. Partlet.

"And couldn't you have told him No, without the preliminary ceremony of coming in here to ask me? Is it likely that I shall lend a dollar or even a cent to Luke Ruddilove? Why, I had a great deal better throw it among yonder red coals! No!—of course not!"

Mrs. Partlet hesitated.

"He looks so pinched and cold and wretched, Josiah. He says there's nobody in the world to let him have a cent."

"All the better for him, if he did but know it," sharply ejaculated the Squire. "If it had come to that pitch half a dozen years ago, perhaps he wouldn't have been the miserable man he is now."

"We used to go to school together," said Mrs. Partlet, gently. "He was the smartest boy in the class."

"That's probable enough," said the Squire. "But it don't alter the fact that he's a poor, drunken wretch now. Send him about his business, Polly, and if his time is of any consequence, just let him know that he had better not waste it coming here after dollars."

And the Squire leaned back in his chair after a positive fashion, as if the whole matter was definitely decided.

Mrs. Partlet went back to the kitchen where Luke Ruddilove was spreading his poor, thin fingers over the blaze of fire, his tattered garments steaming as if he were a pillar of vapor.

"He wouldn't let you have it, Luke," said she. "I thought he wouldn't."

"Then I've got to starve, like any other dog!" said Luke Ruddilove, turning away moodily. "And, after all, I don't suppose it makes much difference whether I shuffle out of the world to-day or to-morrow."

"Oh, Luke, not to your wife!"

"She'd be better off without me," said Luke, down-heartedly.

"But she ought not to be,"

"Ought and is are two different things, Mrs. Partlet. Good night, I ain't going to the tavern, though I'll wager something the Squire thought I was."

"And isn't it natural enough he should think so, Luke?"

"Yes—yes, Mary. I don't say but what it is," murmured Luke Ruddilove, in the same dejected tone he had used throughout the interview.

"Stay!" Mrs. Partlet called to him, as his hand lay on the door-latch, in a low voice. "Here's a dollar, Luke, Mr. Partlet gave me for a new piece of oil cloth in front of the dining-room stove, but I'll try and make them do a little while longer. And, Luke, for the sake of old times—for the sake of your poor wife—will you do better?"

Luke Ruddilove looked vacantly first at the fresh new bank bill in his hand, and then at the blooming matron who placed it there.

"Thank you, Mary," he said, and crept out of the warm, bright kitchen, into the storm and darkness that reigned without. Mrs. Partlet stood looking into the kitchen fire.

"I dare say I've done a very foolish thing," she pondered; "but indeed I could not help it. Of course he'll spend it at the public house, and I shall do without my oil cloth, that will be the end of it all."

And there was a conscious flush on her cheek, as if she had done something wrong, when she rejoined the Squire in the sitting-room.

"Well," said Squire Partlet, "has that no'er-do-well gone at last?"

"Yes."

"To Stoke's tavern, I suppose."

"I hope not, Joshiah."

"I'm afraid its past hoping for," said the Squire, shrugging his shoulders. "And now for a pleasant evening. How it does rain, to be sure."

And Mrs. Partlet kept the secret of the dollar bill within her own heart.

It was six months afterward that the Squire came into the room where his wife was preserving some great red apples into jelly.

"Well, well," quoth he, "wonders never will cease. The Ruddiloves have gone away."

"Gone where?"

"I don't know—out West somewhere, with a colony. And they say Luke hasn't touched a drop in six months."

"I'm glad of that," said Mrs. Partlet.

"It won't last long," said the Squire, despairingly.

"Why not?"

"Oh, I don't know. I haven't any faith in those sudden reforms."

Mrs. Partlet was silent; she thought thankfully that, after all, Luke had not spent the dollar bill in liquor.

Six months—six years—the time sped along in days in weeks, almost before busy little Mrs. Partlet knew that it was gone. The Ruddiloves had gone back to Sequosset.

Luke had made his fortune, as the story went, in the far-away El Dorado, vaguely phrased "Out West" by the simple Sequossetters.

"They do say," said Mrs. Buckingham, "that he bought that ere lot down opposite the court-house, and is going to build such a house as never was."

"He must have prospered greatly," said the gentle Mrs. Partlet.

"And his wife wears a silk gown that will stand alone with its own richness," said Mrs. Buckingham; "I can remember when Luke Ruddilove was nothing but a poor drunken creature."

"All the more credit to him now," said Mrs. Partlet, emphatically.

"It's to be all o' stun," said Mrs. Buckingham, "with marble mantles and inlaid floors. And he's put a lot of papers and things under the corner one."

"The corner what?" said Mrs. Partlet, laughing. "Floor or mantel?"

"Stun, to be sure," said Mrs. Buckingham. "Like they do in public buildings, you know."

"That is natural enough."

"Well, it's kind o'queer, but Luke Ruddilove never was't like nobody else. Folks thinks its dreadful strange he should put a one dollar bill in with the other things."

Mrs. Partlet felt her cheeks flush scarlet; she glanced up to where the Squire was checking off a list of legal items in the bill he was making out against some client. But he never looked around, and Mrs. Buckingham went on with her never-ceasing flow of chit-chat, and so the color died away in her cheeks. After all the money had been her own to give, and the old oil-cloth in front of the dining-room stove had answered very well.

She met Ruddilove that afternoon for the first time since his return to Sequosset—Luke himself, yet not himself—the demon of intemperance crushed out of his nature, and its better, nobler elements triumphing at last. He looked her brightly in the face as he held out his hand.

"Mary."

"I am glad to see you back here again, Luke," she said, tremulously.

"And well you may be," he rejoined. "Do you remember the night you gave me the dollar bill, and begged me not to go to the tavern."

"Yes."

"That night was the pivot on which my whole destiny turned. You were kind to me when every one spoke coldly; you trusted me when all other faces were averted. I vowed a vow to prove myself worthy of your confidence and I kept it. I did not spend the money—I treasured it up—and heaven has added mightily to my little store. I put the dollar bill under the corner-stone of my new house, for the house has risen from it, and it alone. I won't offer to pay you back, for I am afraid," he added smiling, "the luck would go from me with it; but I'll tell you what I will do, Mary; I will give money and words of trust and encouragement to some other poor wretch as you gave me."

And Squire Partlet never knew what his wife did with the dollar bill he gave her to buy a new piece of oil cloth.

Sabbath Reading.

A NIGHT THOUGHT.

As I hear the breath of the mother
To the breath of the child at her feet
Answer in even whispers,
When the night falls heavy and sweet;

And the thought of the other dear ones
Comes down from their cradle above;
'Tis not with the spirit only
Of hope and confident love.

For over each bend in the darkness
A hollow-eyed thing hangs near,
And I know that my treasures tremble
On a thread of gossamer.

O life! what art thou that holdest
What is more than life to thee,
By the tenure of their own hours,
Thine own fragility?

And each breath is a sigh, that nearer
Brings the long farewell to me.
O life! thou shouldst be life truly,
Or else thou shouldst not be!

[*F. T. Palgrave.*

EXTRACTS FROM SERMONS.

How to Get a Healthy Spiritual Life.

Bonar says:—"If you want your spiritual life to be healthy and vigorous, you must just come more boldly to the throne of grace. The secret of your weakness is your little faith and little prayer. The fountain is unsealed, but you sip only a few drops. The bread of life is before you, yet you eat only a few crumbs. The treasury of heaven is open, but you take only a few pence. O man of little faith, wherefore doubt? Awake to know your privileges! awake! and sleep no longer. Tell me not of spiritual hunger and thirst so long as the throne of grace is before you. Say rather, you are proud, and will not come to it a poor sinner; say, rather, you are slothful, and will not take pains to get more. Cast aside the grave-clothes of pride that still hang around you. Throw off that Egyptian garment of indolence which ought not to have been brought through the Red Sea. Away with that unbelief which ties and paralyzes your tongue. You are not straitened in God, but in yourself. Come boldly, for you may, all sinful as you are, if you come in the name of the great High Priest."

The Secret Closet.

Cuyler says: We must not overlook one room in our converted heart, though it be ever so small or ever so secluded. It is the secret "closet" where Faith holds sweet fellowship with God. It is fragrant with the presence of Jesus. Here stands the mercy-seat. To this inner sanctum Faith keeps the golden key, inscribed, "Ask and ye shall receive; seek and ye shall find; pray without ceasing." Over the door she reads the inviting words: "Enter into thy closet, and when thou hast shut thy door, pray to thy Father which seeth in secret; and thy Father which is in secret shall reward thee openly." On the walls are inscriptions written in moments of devout intercourse with God, when the meditations with him were like the droppings of the honey-comb. This is Faith's stronghold; here she weapons herself for the daily conflict. Silence in that closet of prayer bespeaks death throughout all the house. When that door is suffered to rust on its hinges, and that chamber is deserted, then the heart-house is soon re-taken by Satan, and the evil spirits come in and dwell there.

The Love of God.

Phillips says:—Did you ever try the effect of believing the love of God to the world? of believing the ability of Christ to save you? of believing what God has sworn, that he has no pleasure in the death of a sinner? The Spirit may not have helped your infirmities at all, whilst you were trying to believe that you were an elected, or an adopted, or a regenerated child of God; but the question is, would the Spirit have withheld his help, had you tried as much to believe that the blood of Jesus Christ cleanseth from all sin? Remember that the Spirit's grand aim is to "glorify Christ," and not to give us such a good opinion of ourselves as should warrant us to hope in Christ. It is the things of Christ, which he shows to the soul, when he converts the soul.

Christ an Unchangeable Priest.

McCheyne says:—"Precious friend and unchangeable priest, is Christ—sweeter to you than the honey and the honey-comb. How great is the goodness he hath laid up for them that fear him! Just as the miser lays up money that he may feast his eyes upon it, so Christ has laid up unsearchable riches, that he may supply all we need out of them. Unfathomable oceans of grace are in Christ for you. Dive and dive again, you will never come to the bottom of those depths. How many millions of dazzling pearls and gems are at this moment hid in the deep recesses of the ocean caves? But these are unsearchable riches in Christ. Seek more of them. The Lord enrich you with them.

If the divine earnestness within us only shift, and does not die, it matters little what becomes of our mere theology; and deep-hearted practical faithfulness is not separated long from true-thoughted practical faith.

Ladies' Port-Folio.

LOCKED OUT.

BY FANNY M. BARTON.

'Tis useless to try the door,
O pitiful woman of sin!
O woman, so gaunt and so thin,
Use vain entreaties no more.
O woman with falsely-red cheek,
O woman so wan and so weak,
'Tis useless to try the door.

Out in the pitiless cold—
With your ragged cloak of deceit,
Out in the curious street,
Bewildered, afar from the fold.
Vaguely wandering up and down,
'Mid jest and laughter and frown,
Afar from the safe, happy fold!

'Tis useless to try the door.
They hear your faltering rap
In the cheery parlors, mayhap,
But they'll open to you no more;
The sound makes sweet faces frown.
For you they'll never come down
To open the bolted door.

You'll wash your garments anew?
Ah, the stain will never come out;
Eyes will glare with scorn and with doubt,
No matter what you may do;
The voices of young and of old
Will bid you stay out in the cold,
No matter what you may do.

'Tis useless to try the door,
O repentant woman of sin!
Ah, yes, it all might have been,
But naught can avail any more.
Straying feet, you cannot go in,
Frantic heart, you are lost for your sin—
They will not open the door.

No matter for your few years,
The hearts of young and of old
For you are bitter and cold,
No matter now for your fears.
Only CHRIST will offer you grace,
And pity your poor hollow face,
When you wash His feet with your tears.

THE UTAH WIVES.

MRS. STENHOUSE has been lecturing in Denver, Col., and a paper of that city gives the following report of what she said, which, it seems to us should be placed before the women of America:

Mrs. STENHOUSE began her lecture with a brief sketch of the origin of the doctrine which gave rise to the polygamic evil, and its effect upon the women in Utah and elsewhere. She was in Switzerland at the time, and it was her mission to break it to the sisters there. She felt as if she was bringing a blight upon every home, and pointing a poignard at the breast of every woman in the land. She then described the practical working of the system in Utah, quoting from BRIGHAM YOUNG himself to prove the deep, unutterable, and universal unhappiness caused by it. The murmurs and tears of the women were unheeded. They were commanded to round up their shoulders and bear the burden, or expect a complete and lasting divorce. Those who complied were promised rule as kings and queens in heaven; those who did not were to be damned. The terrible maledictions of YOUNG meant something. They knew that he would ruthlessly apply his doctrines of blood atonement, if necessary, and many a man and woman had, for their opposition, been buried in quiet graves, where they would rest until the day when they should meet their murderer, not as a judge, but as a trembling culprit.

So little were women respected in Utah that elders had said, "We think no more of marrying a wife than of buying a cow." But there were no wives in Utah, they were nothing but slaves.

Mrs. STENHOUSE then gave a new and startling statement of the attitude and expectation of the Mormons during the great rebellion. They gloried in the carnage, and predicted that the males would be killed, except a very small remnant, and that then they would take the Gentile women as their spoil. They applied a passage of Scripture to that anticipated result, and believed that seven women would lay hold of one man and say we will eat our own bread, etc., only let us be called by thy name to take away our reproach. Her picture of the plural wives, their lonely, comfortless, and sometimes destitute condition, was touching and constituted a strong argument against the infamous practice.

BRIGHAM YOUNG was denounced as a stern, implacable tyrant, and his conduct toward his wife, HARRIET COOK, cited as proof. This young, high-spirited woman had aspired to the position of Sultana, as having borne the Prophet the first son under the new system, but YOUNG had steadily ignored her pretensions. One day the child was punished by her and stigmatized as a bastard. The sting was not intended for the boy, but for his father, who was within hearing. He came forward and said "HARRIET, that is the last bastard you shall ever have." And for a quarter of a century she has been a husbandless wife. Other instances of a similar character were narrated.

The fearful practice had its female supporters, of whom ELIZA SNOW was chief. She had recently published a letter purporting to come from a country-woman, in which the degrading vice is praised as beneficial to the temper and character of woman. Mrs. S. knew of one wife who went insane when her husband took another to his home, and when he died, soon after, she ran out of her hovel, and with curses and maniacal cryings threw stones at his coffin. The Union Pacific Railroad came, and then YOUNG gave women the suffrage, not that they might emancipate themselves, but because the ciphers should magnify him, the only figure recognized of value. The horrors of the Endowment House were then exposed, and a story told of ORSON PRATT which, for its perfect telling and the world of woe it reveals, ought to be published verbatim as a tract, and sown broadcast over the world wherever the disciples of polygamy seek to make converts.

A LOVELY WOMAN.

IN the common acceptance of the term, a lovely woman is one who is perfectly passive, whose amiability is her greatest fault. Her countenance is serene and placid under all circumstances, she agrees with everybody, no matter what ideas are expressed, but seldom advances an opinion of her own; and when she does, it is uttered in that doubting, hesitating manner which implies a lack of confidence in her own judgment. I remember a school girl of this lovely type, who always impressed me as a powerless baby—something to love and care for, nothing more.

Her face bore the same look of serenity upon all occasions; she never went into raptures over anything that was particularly pleasing, as most school girls do; neither did she ever grumble or scold upon any provocation.

I was much amused one day at table. Her right-hand neighbor was scolding about the meat, and, turning to her, said, "Isn't it tasteless stuff?"

"Yes," replied the lovely girl, with the sweetest of smiles. Presently the young lady on the left remarked that the meat was excellent. "Yes, it is," she replied, with the same placid smile.

I used to wonder what kind of a help-meet this young lady would make. Yet since that time I have seen strong-minded, energetic men marry just such placid creatures, and after a few years, tired of such perpetual serenity, turn to forbidden sources for such society as their natures craved, while the wife of such a man, although her heart was breaking, would meet him with that same sweet smile, never reproaching him to the day of her death.

I have a different ideal of a lovely woman. She is not a virago, nor as passive as a doll; but a woman of good, sound common sense, who has a few ideas as well as the man she married; who is affectionate and kind but has some spirit and does not hesitate to show it at the proper time. She can kiss her husband when he leaves the house, and give him a good scolding when he returns, if he has spent the night at the Club instead of at home.

She is active and ambitious; likes to be well dressed herself and to see her children well dressed. She makes her home as pleasant and attractive as possible, does not say yes to everything, but expresses her own independent ideas in a ladylike manner. She is not always the same; she is sometimes flurried and excited, and sometimes loses temper entirely; for she is but human; but she always controls herself as well as possible, and acts like a woman possessed of a good mind and a good heart.

CLARA JULIEN.

WOMAN PERSONALS.

MISS EMILY FAITHFULL, who is now in this country with the avowed purpose of examining and studying our Institutions, organized, in 1860, the Victoria Press, a printing establishment in which only women are employed as compositors. Queen VICTORIA has smiled on and encouraged the undertaking. Miss FAITHFULL is also the editress of the Victoria Magazine.

IN her quiet retreat at Patchogue, Long Island, surrounded by her books, statues and pictures, Madame E. OAKES SMITH is writing some pleasing reminiscences for Appleton's Journal. In one of them she speaks of meeting, so long ago as 1845, Mr. FELICE E. FANESTI, the Italian patriot and exile, at a party given by Miss LYNCH, now Madame BATTA. At this reception she met CHAS. F. HOFFMAN, HENRY T. TUCKERMAN, N. P. WILLIS and Miss CATHERINE SEDGWICK. Madame BATTA still continues her receptions, and at one of the last we met BAYARD TAYLOR and wife, Mrs. LEONOWENS, RICHARD GRANT WHITE, LAUNT THOMPSON, R. H. STODDARD and wife, and many other people not unknown to fame.

MANY Englishmen of note have married American wives. Some of the more prominent cases are the following:—The dowager Duchess of Leeds, who was a Miss PATON; Mrs. SEYMOUR, daughter of Mr. RUSSELL STURGIS, the wife of Col. LEOPOLD SEYMOUR of the Grenadier Guards; a brother of Lord CANINGTON married a daughter of A. T. STEWART'S American partner in Paris; the wife of Lieut.-Col. PAKENHAM of the 30th Regt. was a Miss CLARKE of New York; Mrs. ADAIR of Derryreagh Castle, Ireland, is a daughter of the late Gen. WADSWORTH of Geneseo, N. Y., and her aunt was the wife of Hon. Sir C. A. MURRAY, K. C. B.; the Hon. Mrs. LEE is the daughter of Mrs. KEMBLE-BUTLER; Madame VAN DE MEGAR is the only child of the late JOSHUA BATES of Boston; Mrs. STEWART MAITLAND is the widow of the eldest son of Lord DUNDRENNON; she is the daughter of the late Mr. LYNCH of New York.

Reading for the Young.

THE HEIFER, THE GOAT AND THE EWE,

In League with the Lion.

FROM THE FRENCH OF LAFONTAINE.

ONCE on a time, when the world was new,
The heifer, the goat, and their sister the ewe,
Made with the lion what's now called a "*ring*:"
Come, gain or loss, to share everything.

In the trap of the goat a stag was caught,
And before the "*ring*" at once was brought
To be divided, fair and square,
That each of the four should have his share.

Upon the carcass the lion sprang,
And with tooth and claw he then began
To divide the body, and said, with a shout,
"The first part's mine, without any doubt,

"Because I am master. And I have a right
To the second part, because of my might.
I will have the third part; that's enough.
If you touch the fourth part, I'll eat you up."

Now that the world is old and wise,
And wears big spectacles over its eyes,
Beasts form no rings. But now and then
We hear of the "*rings*" of certain men.

Each swears to help all, come good or ill;
But to help self first, and the pockets fill,
Is the common thought. And the lion's share
Still falls to the strongest. Of "rings" beware.

E. C. PIERCE.

OUR LETTERS FROM BOYS AND GIRLS.
